CALIFORNIA  
STATE LIBRARY.

No. *68471*

When, from whom, and how this volume was obtained,  
with the price paid, if any, may be found opposite  
the above number in the Register of Books,  
which is always open to inspection.

*Extract from the Political Code.*

SECTION 2296. Books may be taken from the Library  
by the MEMBERS OF THE LEGISLATURE, DURING THE SESSIONS  
THEREOF, and by other State officers at any time.

SEC. 2298. The Controller, if notified by the Librarian  
that any officer has failed to return books taken by him  
within the time prescribed by the Rules, and after demand  
made, must not draw his warrant for the salary of such  
officer until the return is made, or three times the value  
of the books, or of any injuries thereto, has been paid to  
the Librarian.

SEC. 2299. Every person who injures or fails to return  
any book taken is liable to the Librarian in three times  
the value thereof.

No person shall take or detain from the General Library  
more than two volumes at any one time, or for a longer  
period than two weeks. BOOKS OF REFERENCE SHALL NOT  
BE TAKEN FROM THE LIBRARY AT ANY TIME.—[Extract from  
the Rules.]

The foregoing Regulations will be strictly enforced.

# MINING AND SCIENTIFIC PRESS.

INV. 1894

68471

An Illustrated Journal of Mining, Popular Science and General News.

BY DEWEY & CO.  
Publishers.

SAN FRANCISCO, SATURDAY, JANUARY 7, 1888.

VOLUME LVI.  
Number 1.

## The Drumlunnon Mine.

We gave in a recent number of the PRESS a description of the famous Drumlunnon mine, belonging to "The Montana Co., Limited," and also an engraving showing a vertical section of the mine. It seems that in London, recently, efforts have been made to spread reports of a damaging character to the mine and its managers. Some of the shareholders became unduly alarmed at these reports and the unexpected change in grade of ore. The resident director in answer to inquiries made by cable regarding the reserves of high-grade ore at present blocked out and in sight ready for extraction, says "that the amount may be estimated approximately at 72,000 tons, but that \$35-ore is the highest grade in reserve at present." The point of division between high and low grade ore is \$20 per ton; all over \$20 in value is included in the estimates of reserves as high-grade ore. Of low-grade ore there is a very much larger quantity now than when the last half-yearly estimate was made.

The "unexpected change" is explained thus: The body of very high-grade ore running from \$50 to \$70 per ton which existed at and for some distance above the 400-foot level in Pixley Nos. 2 and 3 shoots, was found to have been disturbed, as stated by Mr. R. T. Bayliss at the meeting on 24th September last, at the 500-foot level, by the crossing of the Armistage lode, and for the present and until discoveries of very high-grade ore are made they must rely upon ore of about half its value to supply the 50 and 10-stamp-mills. It was quite unexpected that the very rich ore would have lasted until the Jubilee and other rich shoots might be cut in the 600-foot level and elsewhere. These expectations have not yet been fulfilled, hence the falling off meanwhile in the monthly runs.

Mr. R. T. Bayliss has communicated by cablegram the following estimates for the guidance of the directors and shareholders regarding the monthly runs expected. He estimates the run for December at about \$110,000, and the average runs for January, February, and March, 1888, at about \$120,000 or \$130,000 per month, and it is expected that there will be a reduction in working expenses, an indication of which is given in the November statement, in which they are shown to be \$49,000, as against \$56,000 for October. Should the Jubilee or other shoots of very high-grade ore be cut in the meantime, the returns will, no doubt, be favorably affected. Shareholders will remember that in November, 1884, the mine and its capital of £660,000 was on the verge of being lost to them. Since that date the mine has paid off the then existing mortgage and debts, and in the last two years has returned to its stockholders in dividends more than half the capital of the company, besides paying for the

acquisition of several adjoining properties of great value; and further, has paid very large sums out of revenue for machinery, depreciation and reserve funds. These statements are made by the directors to the shareholders to protect them against undue and unreasoning panic.

THE "coal famine" in California is helping out the Oregon coal-mining regions. Near Marshfield heretofore they have been working only the Newport mine, but now they are going to start up the Eastport and Southport mines. The Newport is producing from 6000 to 8000 tons per month, and owing to the coal famine there has been an increase in miners'

## An Automatic Fuel Feeder.

We give on this page a cut of Garland's automatic sawdust or fuel feeder for boiler furnaces, applied to a three-boiler furnace. In the engraving *E* is the feed-trunk, which is made of No. 12 or 14 tank iron and is provided with running strips of iron in the bottom of the trunk; also with ribs near the top of the buckets to return on. The dust or fuel is fed to the trunk *E* over the shaft and sprocket wheel at *H* 2 and is carried forward by the chain and buckets and fed to the spouts *F* to the grate-bars. The spouts *F* are made of cast iron, and the standard size is 20 inches lengthwise of the boilers and 8 inches

## That Reward to Inventors.

In a recent number of the PRESS we made mention of the fact [that the Government of New South Wales had offered a reward of £25,000 to any person or persons who will make known and demonstrate at his or their own expense any method or process not previously known in the Colony for the effectual extermination of rabbits.

The reward is offered through "The Department of Mines." The conditions are as follows:

1st. That such method or process shall, after an experiment for a period of 12 months, receive the approval of a board appointed for that purpose by the Government, with the advice of the Executive Council.

2d. That such method or process should, in the opinion of the board, not be injurious, and shall not involve the use of any matter, animal or thing which may be noxious to horses, cattle, sheep, camels, goats, swine or dogs.

3d. That the board shall be bound not to disclose the particulars of any method or process unless such board shall decide to give such method or process a trial.

All communications relating to the above must be addressed to the Honorable F. Abigail, Secretary for Mines, Sydney, New South Wales.

Of course, all sorts of things have already been tried to prevent the spread of the rabbits and exterminate those already in existence. Poisons of various kinds have been used.

The Inspector of Stock of Victoria thinks the main cause of the failure of the

poisons in that Colony has been the want of simultaneous action on the part of the owners whose land was infested. Phosphorus is now more generally used than any other process. The inventors of the United States have a chance to earn a big reward if they can by any means solve the problem set before them.

THE extent to which the Atchison & Santa Fe railroad will build in Southern California may be inferred from the fact that already 3500 tons of steel rails are in San Diego harbor and 6500 tons more are on the way, every foot of which will be used in track-laying in Southern California. The Southern Pacific, too, does not intend to neglect the lower portion of the State, but will considerably amplify its mileage there.

QUICKSILVER continues firmly held at \$48 to \$50 per flask. The production in California last year is given at 31,000 flasks, and the exports at 19,573 flasks, against a production of 29,981 flasks and exports of 19,950 flasks in 1886.

THE El Callao gold mine in Venezuela is producing about \$100,000 per month. For the first five months of 1887 the product was \$621,500, or \$104,300 per month. Total product in 15 years, \$21,841,000.

THE GARLAND AUTOMATIC FUEL FEEDER FOR BOILER FURNACES.

wages of from 50 to 75 cents a day, or \$1.12½ per ton. The famine has increased the output from 2000 to 3000 tons per month. Coos county, in which Marshfield is situated, has a population of about 7000, and does all its trading with San Francisco, as does all the region west of the Coast Range.

MR. M. PRACHT of Alaska says of the mines there: "The chain of islands, including Douglas island, 200 miles distant from Naha bay, are nothing else but the tops of a submerged mountain range. The mountain-tops, too, are quarries of low-grade gold ore, averaging, like the now famous Treadwell mine of Douglas island, from \$5 to \$6 a ton. It is a great field for heavy capitalists, but not a good one for men with no money. The Treadwell people had to invest \$500,000 before they got on a basis to make money. Their 120-stamp mill enabled them to make a profit. They are now realizing over \$100,000 a month right along."

DURING the past year the price of quicksilver reached a higher point than for many years, the local market going as high as \$50 (nominally) per flask. During the past 10 years the lowest price in this market was \$25.25 per flask, in 1879.

wide. This is at the top end, and at the bottom the size is 20 inches by 3½ inches. About 18 inches from the trunk *E* to where the dust is discharged from the spouts, there is a cast rib on the front and rear side 6 inches from the trunk down; the rib rests on two bars of iron. The bars run across the boilers and support the trunk and spouts, and all machinery attached to the trunk. The spouts *F* are provided with slide-doors *G* and balance-doors *D*, with weights and set-screws. They can be readily adjusted. The balance-doors are used as a protection should the fireman get careless and leave the slide open and at the same time open the front furnace-doors. Again, they keep the rush of air down them to a small quantity which does not impair the draft of the furnaces. The trunk *E* is 20 inches wide and is placed directly over the center of the grate-bars so the discharge of the dust will be on the center of the grates. If the operator is a good one the overflow spout *F* 2 can be dispensed with where it will be objectionable and the feed to the trunk can be regulated just sufficient to feed the fire properly. This can be done in the carrier that conveys the fuel to the feed-trunk. The feeder and frames are all of iron, so that they are safe and fire-proof. The Pacific Coast agents are H. P. Gregory & Co. of this city.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Bernice District, Nev.

EDITORS PRESS:—Mention not having been made of this district in your paper for some little time, I will endeavor to give an account of what we have been doing, and show that we have not been "sleeping on our oars." Without attempting to minutely describe the progressive stages of development in each individual claim (in this letter at least), I will confine myself to mines where work of development places them in a position to begin the work of extracting ore on a long and productive stretch. The Golden Crown, whose record in the past few years has been a very satisfactory one to its owner, Mr. W. W. Williams, has accomplished an amount of deadwork within the past six or eight months that required both pluck and money to accomplish, considering the ruinous depression in silver and the long stretch of tunneling and upraising to make in order to give facility for stoping and free ventilation. The two upper levels being partly worked out, it became necessary to run a still lower tunnel, which was commenced over a year ago, at 200 feet lower on the pitch of the ledge. The main chute of ore in the mine pitching to the northwest required a tunnel entering on the south side of the hill 850 feet to reach the ore with an uprise of 195 feet to connect with the level above, opening a large area of ground for stoping, which gives every promise of yielding a handsome return.

The two levels above turned out about a quarter of a million in bullion. There is every reason to believe the present level will double that amount, the character of the ore being greatly improved as depth is attained. With an abundant supply of wood and salt and the mill all ready for action, signs of life and activity will soon make themselves manifest.

The Silver Ridge mine is owned by M. W. Hoyt. A force of able-bodied miners has been working like beavers for several months at deadwork in the opening of a new level, which is expected will be ready for the extraction of ore by the beginning of the new year. The ore from this mine is of good grade, milling about \$150 per ton.

South from here, on this same range of mountains, Stone & Oats, with the assistance of "Poker Boh" as chief engineer on the wind-las, are opening a very promising piece of property. They were down last week 93 feet on a vein of carbonate and galena ore averaging two and a half to three feet the entire distance. The footwall is quartzite and the hanging a gray lime. They estimate to have 100 tons of first-class smelting ore on the dump. J. I. Bernice, Churchill Co., Nev., Dec. 26th.

## Nevada Copper.

At one time a considerable amount of copper was produced in this State, says the Virginia Enterprise, but owing to the low price of the metal which ruled for some years those engaged in copper-smelting turned their attention to gold and silver mining.

In 1882 the copper yield of Nevada was 350,000 pounds; in 1883 it was 288,077; in 1884, 100,000; in 1885, when copper-smelting was abandoned, it was but 8871 pounds.

Now, however, there seems likely to be a boom in copper, and we shall probably again become a copper-producing State. Owing to the shutting down of the great Calumet and Hecla mine, on account of the fire in its lower levels, copper is likely to be in very brisk demand. Already an Eastern metal firm has announced its readiness to take all the copper produced in the United States, and to keep on taking it until the price reaches \$80 a ton.

We have in the Walker Lake region some very rich copper mines. Some of these have been worked, are already opened in good shape, and have furnaces which are still probably in a condition to be fired up with slight repairs. There are good veins of copper in all parts of the State, but only a few of them have ever been opened or worked. In places hundreds of tons of ore lie on the sides of mountains where it has tumbled down from the croppings of veins above, and in not a few veins native copper is to be seen at the surface of the ground and sometimes 10 feet above the surface.

THE CARSON HILL MINE.—A decision was rendered last week by the Supreme Court in a very old mining suit. A. Gray Morgan was owner and in possession of a gold mine at Carson Hill, Calaveras county. He died in this city on the 26th of April, 1860, and on the 18th of December, 1861, R. F. Sinton, who was the administrator of the estate, sold to James G. Fair all of Morgan's interest in the mining company which the latter, prior to his death, promoted to work the mine. At the time there were other persons in possession of the property adverse to the interests of Fair. Legal proceedings in connection with the Carson Hill mine were before the courts from 1865 to 1867, when James G. Fair was declared the owner of Morgan's rights. On the 25th of October, 1879, the property was assessed for \$84, which sum was not paid, and the property being about to be sold, William Irvine received from Fair the money wherewith to purchase it. In 1870 he went into possession, it is alleged, as the agent of Fair, and so remained until the 1st of October, 1872, when he asserted that he was the owner of the mine and disavowed his having been agent for Fair. On the 4th of July, 1876, Cornelius O'Connor was deeded all of Fair's claims to the property and began proceedings for its recovery, with the result that in the old District Court judgment was pronounced in his favor. An appeal was taken in the case. J. Selevor, who was interested with Fair in the original transaction regarding the mine, was not made a party to the proceedings in the court below, and last week the Supreme Court decided that the absence of Selevor as a party prevented a complete determination of the suit and declared the former order and judgment reversed and directed a new trial.

## California Products.

The following is copied from a pamphlet issued by Colusa county during the present year:

The population of the State of California is more than 1,000,000, and is being increased by births and immigration at the rate of 60,000 per annum.

The State of California is practically out of debt. The banking capital of the State is \$50,000,000, held by about 100 banking institutions. The resources of the banks foot up \$170,000,000. The banks hold cash on hand \$25,000,000, and reserve funds of \$15,000,000. They hold on deposit over \$100,000,000, of which over \$60,000,000 is held by the savings banks. The annual increase of deposits is about \$10,000,000. The average amount of deposits per capita is \$715, the highest average in the United States. The annual product of hulla is \$18,000,000. The average value of the wheat crop is \$40,000,000; barley crop, \$10,000,000; dairy products, \$10,000,000; bay crop, \$13,000,000; wool clip, \$9,000,000; fruit crop, \$12,000,000; wine products, \$7,000,000; manufactured lumber, \$6,000,000; animals, poultry, etc., slaughtered, \$23,000,000; manufactures, \$50,000,000; other products, \$10,000,000; total value of annual products, \$190,000,000. There are over 100,000,000 vines and over 8,000,000 fruit trees in cultivation in the State.

The State contains 3500 miles of railroad, 5000 miles of telegraph line, 5000 miles of mining ditches, with an equal extent of irrigating ditches, 400 quartz-mills, 300 sawmills and 200 flouring-mills.

The assessed value of the real estate of the State is \$616,000,000; personal property, \$152,000,000; railroads, \$48,000,000, or a total assessed valuation of all property in the State of \$816,000,000, representing a real valuation of not less than \$1,200,000,000. California ranks ninth in the Union in aggregate wealth and first in per capita wealth.

COAL SUPPLY OF THE RAILROAD COMPANY.—The Southern Pacific Railroad Company is not experiencing any trouble with regard to the scarcity of coal. One of the officials of the road stated to a Chronicle reporter recently that the product of the company's Carson Hill mine is now about 20,000 tons a month. The steam collier San Pedro is undergoing repairs at the Union Iron Works, and as soon as they are completed she will resume her trips to the mine. The mines of the Rocky Mountain Coal Company are furnishing fuel at the rate of 1000 tons a day. From the Union Pacific Railroad Company's mines at Green River and from the Atchison, Topeka & Santa Fe Railroad Company's mines at Trinidad, the Southern Pacific Company is also obtaining supplies for its locomotives. It is a strange fact that although the Southern Pacific and Central Pacific systems extend from Louisiana to Oregon, there has never been found a trace of coal at any portion of their property, although they have expended thousands of dollars searching for the mineral. The foreign coal required at the Sacramento works of the company has been contracted for some time ago, and large stocks of that particular kind of fuel are now on hand.

A NEW MINERAL.—A few weeks since Mr. John Farish, the well known mining engineer and mineralogist of Denver, visited Tombstone, and while here procured a sample of ore from the Bob Ingersoll mine. Upon examining the rock he found it to contain, among other metals, one which to him was entirely unknown. After a patient search and thorough delving among all the authorities on mineralogy, he found himself still unable to determine the character of the mineral and submitted it to Prof. Emmons of Denver, one of the best authorities in the United States on mineralogy, for analysis. The professor gave the matter careful study, and he, too, could not determine what it was, and forwarded it to the Smithsonian Institute. Here was the court of last resort, and here it was determined that the mineral was one hitherto unknown. The authorities of the Institute, in honor of Prof. Emmons, whom they supposed had discovered it, gave it the name of Emmonsite, although, as will be seen from the foregoing, the honor more properly belongs to Mr. Farish. The mineral is found in the form of a green crystal, but as yet its commercial value has not been determined.—Tombstone Prospector.

A PARTY of fishermen from Gloucester, Mass., has arrived at Puget Sound. Three fishing schooners are on the way.

## Mechanical Engineers.

(Concluded from our last.)

[From our Special Correspondent.]

The first paper read before the evening session was by John J. Grant, and his subject was "The Milling Machines as the Substitutes for the Planer in Machine Construction." The speaker thought that every part of a locomotive could be as well made by the milling machine as by the planer, and from one-half to one-tenth the cost.

A discussion followed in which Henry R. Towne, Prof. Webb, Charles Potter, Jr., Prof. Denton, John E. Sweet, W. F. Durfee and John T. Hawkins took part.

Prof. E. H. Thurston of Ithaca, N. Y., presented a paper by Frank Van Vleet on "Standard Section Lining." This paper advocated a uniform system or method to be used in sectional drawings, just as uniformity is now generally in heraldic and geologic draughtsmen's work.

Percy A. Sanguinetti of Philadelphia read an essay entitled "Divergencies in Flange Diameters of Pumps, Valves, etc., of Different Makers." The question of their divergence elicited remarks from W. O. Webber, Fred W. Taylor, Mr. Towne, W. Barnes Le Van, Mr. Weightman, Louis G. Engel, A. H. Raynal, Mr. Kent, Wm. F. Mettes, Mr. Hawkins and E. F. C. Davis.

A thesis on "Centrifugal Pumps and their Efficiencies," by Wm. O. Webber, was read by the secretary, Prof. Thurston and Prof. De Volson Wood of Hoboken, N. J., gave their views on the subject.

The society was invited to visit the Franklin Institute, Riehle Bros' warerooms, H. Daston & Sons' factory, and by Mr. J. J. DeKinder to the city water works.

The morning and afternoon sessions of the third day were devoted to the reading and discussion of papers on technical subjects. The first, entitled "Friction in Toothed Gearing," presented by Prof. Gaetano Lanza, of the Institute of Technology, Boston, Mass., was purely theoretical, and presented as conclusions that the relative efficiency of the bicyclic and the involute form of tooth depends upon the proportions used for each, and that the efficiency of involute gears is not, as has been claimed, independent of the obliquity. The paper was discussed by Professors Webb, Denton, Wilfred Lewis and Hugo Bilgram of this city.

A paper describing "an investigation as to how to test the strength of cements," and giving tables of the results of tests on Portland and Rosendale cements by means of compression, tension, and the use of an eccentric load, was also presented by Prof. Lanza, who stated that it had been written by Prof. Jerome Sondericker of the Institute of Technology. Profs. Lanza and Denton, and Henry De B. Parsons of New York, discussed the paper. Mr. Parsons contributed the next paper, which was entitled "Influence of Sugar on Cement," and contained the result of a number of experiments made by the author, assisted by Henry Hobart Porter, Jr., E. M. The machine used was a "Riehle Bros. Standard Cement Tester," and there were three series of tests. In the first, one per cent refuse molasses being used with Portland cement; in the second, one eighth to two per cent pure crystallized sugar, dissolved, with the same kind of cement; and in the third series Rosendale cement, with two per cent of sugar, as in the second series. It was concluded that the molasses and sugar, by retaining the setting of the cement, ultimately makes it firmer. Prof. Denton, Mr. Parsons and Louis G. Engel, of the Brooklyn Sugar Refining Co., Brooklyn, N. Y., took part in the discussion on the paper.

A paper on "Steel Car Axles" was contributed by John Coffin, of the Cambria Iron Works, Johnstown, Pa. It summarized the results of a number of experiments, with the observations that the chemical energy of the charge of carbon is commensurate with the amount of carbon present in the steel; that the work to be done in breaking up the crystals is commensurate with their size; while the carbon is changing to its non-hardening state, a force is exerted tending to break up crystallization, and that at a white heat steel becomes nearly amorphous. A description was given.

## The Copper Queen Mine.

Twenty tons of clean copper a day is what is coming out of the Copper Queen mine at Bisbee, Arizona, now, said J. E. Durkee at the Palace hotel. Mr. Durkee had just written his name on the register, having yet Arizona dust on his clothes. He is of the firm of J. E. Durkee & Co., the heaviest freighters of Arizona, owning over 100 powerful draft mules and 150 wagons.

"I haul the copper bullion out and the coke in," said Mr. Durkee. "What do you think of 20 tons of pure copper a day? Make a good many kettles, eh? Nobody down there now says he wouldn't give a copper for this or that, because copper has gone up to booming figures. In six weeks it has climbed from 10 to 18 cents a pound. Money is plenty. Bisbee is the liveliest camp in Arizona now. I reckon there are not less than 2500 people there, and every one as busy as a bee. Between 300 and 400 men are at work in and about the mine. They just quarry the copper out, it is so pure. The

vein is very big. The owners of the Queen have a smelter, and they make the ore into bullion without any ado.

"The copper from this mine is first-class, and brings top-notch figures. The Calumet and Hecla fire and the French syndicate, in their endeavors to corner the market, have done the business for the owners of the Queen and the people of Bisbee. Nothing could have suited them better.

"Bisbee is 30 miles from Fairbanks, which is on the Sonora division of the Santa Fe railroad from Benson."

## He Was Not a '49er.

"Then you are an old California miner," I said to a man that was talking very loud as we sat in the office of a Deadwood hotel.

"Yes, sir; yes, sir; one of the Argonauts, sir. Always lived in California till I came to look after my interest in the Homestake mine, sir."

"Were you one of the '49ers?"

"No, sir, I wasn't. I didn't reach California till 1850."

"Ah! I should think that was near enough so you could stretch it a little and say you got there in '49."

"I could if I wanted to make a liar of myself, but I don't, sir! I'm a man of my word, sir, and even if I was going to lie I wouldn't lie about a little thing like that!"

I was somewhat crestfallen, and after he had stepped out I suggested to the proprietor of the hotel that the Californian was the first man from the State of his age that I ever met who did not claim that he reached there in '49.

"When did he tell you that he went?" asked the proprietor.

"In 1850. He said he wouldn't lie about it for worlds—it does me good to see a Californian at last who can tell the truth on that point."

"Yes, well, you haven't seen one yet. To my certain knowledge the first time that old fellow struck California was in '67, when he came down from Vancouver island, where he went three or four years before to avoid the draft."—Chicago Tribune.

EQUADOR MINING REGIONS.—William King of Baltimore, during the past 16 months, has been prospecting for gold along the coast between Guayaquil and Buenaventura. Mr. King states that he prospected everywhere where he thought the ground appeared to be gold-bearing, but encountered nothing which promised to pay until he reached a place called Janabaja, at about a day and a half's canoe journey up a good waterway running in from Buenaventura, and situated in what is known as the Chiquitivi district. At Janabaja he saw extensive traces of old Spanish workings, where the whole region appears to have been sluiced—although it is somewhat difficult today to determine what system was followed, as gigantic trees have overgrown a district in which there are evidences that many thousands of men must at one time have been engaged. The people who now reside there continue to work in the river-beds. They use the batea—the wooden bowl, instead of the old and well-known iron wash pan—and thus obtain regularly from \$1 to \$2 per day, although they do not work regularly, but now and then, as the whim seizes them. Mr. King states that he believes the reason this district has never been thoroughly worked is that the majority of people who have gone there have not been miners. They have heard that gold is found there, and, without being miners, have expected to turn up gold with the first blow of the pick. Mr. King claims there is gold there, and in good paying quantities, but there, as everywhere else, it has to be worked for if it is to be obtained.

THE COAST SURVEY.—Captain Rodgers of the United States Coast and Geodetic Survey has returned from his season's work in the lower part of California, where he has been engaged in the prosecution of the topography and the tertiary triangulation. He commenced the season with a survey of the shore line of San Diego bay and the location of the wharves and other improvements, preparatory to a study of the physical hydrography of that vicinity. After that he pushed forward the triangulation and the topography to the northward. In order to utilize the coast determinations for the new chart from San Francisco to San Diego, he has run in the shore line ahead of the other topography, and made a connection with his previous seasons' work from the northward. Captain Forney has also returned from his season's work in the region from Pismo Blancas toward "The Sur," just south of Carmel bay. This is perhaps the wildest stretch of coast line on the Pacific seaboard. The Twin Peaks reach an elevation of 5100 feet within three and a half miles of the water, and in one place the height of the rocky face is 3200 feet only half a mile from the ocean. This precipitous seawall is cut in many places by deep and almost inaccessible gulches, which it is necessary to go around, because they cannot be crossed. The work has progressed very favorably, notwithstanding the smoke and fog have been very dense this season. Mr. Winston of Captain Rodgers' party has also returned, and, with Messrs. Rodgers and Forney, is engaged in reducing the season's work.

CAPITAL has been subscribed to build a lumber mill at Woodland, Yolo Co. The land has been donated.

## The Mines and Miners.

BY PEDRO CASTERA.

(Continued from issue of Dec. 17th.)

Translated for the PRESS from *El Minero Mexicano* by M. N. M.

## The Blaster.

Santa Rosa is one of the five shafts of the Valenciana mine, situated in one of the principal mineral regions of the world—Guajalato. It is likewise the first and richest in our State, and should be regarded with pride by her sons as having a greater depth than any other mine in the world. Before proceeding, and in order that one may not believe that I am drawing upon my imagination, I will mention that in the year 1851 in the Arcangelos shaft, belonging to the mine of the same name, situated in the Real de la Luz, a number of sacks of powder exploded which instantly killed 140 men. In the shaft of Los Ingleses, also belonging to the same Real (mining town), the roof of the works of the Purisima and San Antonio fell in, burying the greater part of the people of the mine. If I were to continue citing historical facts concerning Guajalato only, I could fill volumes. That to which I now refer happened to Senor D. Luciano Cerbera in the shaft of Santa Rosa. To open a shaft is to penetrate from the surface to the heart of a hill, passing through strata of slate, porphyry, marble, granite, quartz and other kinds of stone, hard, resisting and difficult to break. This is effected by making a pozo (hole) square or polygonal, which varies in form and dimensions.

## The Surface Having Been Outlined

Or traced, they penetrate by means of taledros (borers) operated by two men, one using a barreta (small bar) of steel, the point of which rests against the rock, and the other striking with a hammer against the head of the barrena (borer) which is seen above the barretero and near his ear. When the borer measures half a vara or a vara the barreno (hole) is loaded with powder, a canyuela or mecha (matchrope or fuse) is applied, it is then filled with earth, which is packed down, after which fire is applied to the mecha. This is what is called making, loading and firing a barreno. Upon setting fire to the powder by the canyuela there is an explosion and the rocks are rent as if by a grenade. In this manner the work is carried on, penetrating to the interior by a succession of borings. I omitted to explain that when the hammer misses the barrena, either intentionally or involuntarily, sometimes the barretero's hands are crushed, and at other times his head is broken, the brains spattering the walls or pavements of the works. When a tiro or shaft reaches 20, 30 or more varas of depth, 12 to 15 barrenos are opened in the bottom, charged with powder and made ready for firing with mechas of different sizes. All then go out of the tiro, and a man whose salary is large because of the danger attending his work, descends to fire the barrenos. This man is the pegador. The writer, when but a youth, acted as pegador at the time they were opening the tiro of Providencia in San Anton de las Minas. The pegador has fastened in his belt a mecapal, with a hook, and when the mechas have been lighted he with his hook catches himself as quick as possible to a ring at the end of a cable which is suspended from the mouth of the tiro.

## This Cable or Rope is Wound Upon

The malacate (windlass) operated by horses, which rotate it rapidly as soon as they perceive the slightest movement or when they hear the voice of the cajonero who cries *arrea!* There are times when by the explosion of the barrenos, the man who is being hoisted up is killed. The tiro of Santa Rosa then measured 100 varas and Senor D. Luciano Cerbera was pegador. One evening he descended as usual to the bottom of the tiro and in the shaft which was some six varas in width, 18 barrenos with their canyuelas were ready to be exploded. With his *tea* or *hacha minera* in his hand he examined the condition of his mecapal, of the cable, of the ring and of the hook. Convinced that everything was in order, he called out to the man at the mouth of the tiro: "En el fondo y sin novedad!" (at the bottom and without injury). Then the cajonero, in order to notify him that all was ready, replied, "El pegador puede der fuego!" (the pegador can fire). Without fear—for miners think not of that—he rapidly lighted one after the other of the canyuelas and darted to the cable to hook himself to it, but could not do so, because in his effort to adjust the hook to the ring, the cable moved and the cajonero cried, "*arrea!*" The horses with their utmost speed revolved the windlass and the rope was wound up, leaving the pegador in the tiro. He saw that he was lost, but, being a resolute man, without hesitating an instant, he rushed to the barrenos

to draw out their canyuelas. He succeeded in removing eight, when suddenly a deafening and frightful noise resounded at the bottom of the tiro. The pegador, who had been thrown down by the concussion, rose up, and, supported by one of the walls of the tiro, courageously surveyed the danger which surrounded him.

## Nine Blasts were About to Thunder.

As the miners say, and the man would surely be torn to pieces by them; but he, impassible and undaunted, waited like a stoic. What was it that made Cambronne a hero? A word uttered at Waterloo, when the star of Napoleon was disappearing forever. Why has the phrase of Galileo, *E pur si muove*, become immortal? Because those expressions were the manifestations of an unconquerable spirit. The imbeciles and cowards, the envious, who choke themselves with their own drivel, the puppets of society, who dream that they are men because they can skillfully arrange their neckties,

## Oil at Stockton.

During the past few weeks rumors have been rife about the progress of the Standard Gas, Light and Fuel Company's oil well, which is situated just beyond the southwest boundaries of the city, a short distance from the Old French Camp tollhouse. At one time it was noised abroad that an immense flow of oil and gas had been tapped; again, the assertion was made that the well was a failure—that there was not the slightest indication of the presence of gas or oil, and that the company intended to abandon the well and give up the search as a bad job. No one was allowed on the premises while the machinery was in operation, and the most curious could do was to form their own conclusions from what little was to be seen about the well and heard upon the streets. It was generally known that R. C. McPherson, one of the most noted oil experts on the coast, had

tions obtainable that the oil belt has been struck, and that oil and gas abound in large quantities.

"Water is the natural enemy of oil. A heavy flow of water has been known to ruin a well with a capacity of 400 barrels per day. The efforts of the workmen are now devoted to attempts to shut off the water.

"This well," explained Mr. Beane, "is what we call an experimental hole, and in this instance the experiment has been more than satisfactory. We have demonstrated beyond the possibility of a doubt that oil belts traverse this valley, and we are satisfied that we have struck an abundance of oil. The only thing we have to contend against now is the water, which prevents the flow of oil. We are still endeavoring to shut off the water, and if we succeed in exhausting the flow we expect to secure a good flow of oil. The earth in this section is of a soft formation, and it will be necessary for us to secure machinery and tools that are adapted to the soil. We have purchased a new patent boring apparatus, with tools and machinery suitable for this country, by which the water can be shut off at each flow."

The company has located a second well on the levee at a point 1300 feet south of southwest of the experimental well, which has already been piped to a depth of 1185 feet. Work on the well, which has been suspended for some time, will be resumed in the course of a week, as soon as the new machinery and tools arrive. Mr. Beane does not anticipate any trouble about fighting against the water in the new well. He expects to have it in good working order within 65 days from the time work begins.

Mr. Beane stated that his company had selected 30 or 40 locations in different parts of the State and proposed to sink more wells. All through the San Joaquin valley and the Coast Range there are surface indications of oil, and, in Mr. Beane's opinion, it will only be a matter of time when Stockton, Tulare, Fresno, Modesto and other towns in this section of the State will be supplied with natural gas and oil in sufficient quantities to furnish all the light and heat required.—*Stockton Independent*.

## Charles Goodall.

The subject of this sketch was born in Somersetshire, England, on the 20th day of December, 1824. He received only an elementary education, which was deemed quite sufficient for a farmer's boy in those days. After a few initiatory years of farm labor, young Goodall's ambition was fired by the good news from the New World, and at the age of 16 he sailed from Liverpool to New York. Losing no time on his arrival hugging around the city seeking uncertain employment, he sailed to Albany, thence to Syracuse, and then traveled on foot into the country in search of occupation. After spending the winter with an English farmer he went to live with an old sea captain, who excited the young man by his big yarns to try a seafaring life, and not long after he sailed on a three years' whaling voyage in the ship *Milo*. This was the most eventful period in his life. During the voyage, which was quite successful, he visited the Cape Verde, Western, Sandwich and Society islands; Chili, Peru, Bolivia, Alaska, Juan Fernandez and many other places, and when the ship returned home richly laden his share was \$183. Little daunted, he again went to sea, and by enlarged travel, with observation and careful use of the ship's library, he laid the foundation of that intelligence, habits of thought, industry and perseverance which have made him one of the honored, successful and solid citizens of San Francisco.

He came to California in 1850, and with pick and rocker tried his fortunes a few months in the mines, but not meeting with success, again turned his attention to the sea, and he embarked on another voyage, visiting the Fiji, Friendly, New Hebrides and other islands, Panama, Australia and China. During one of these voyages, he fell in with Christopher Nelson, a Dane by birth, who had been wrecked and thrown among the Fiji cannibals, but rescued and brought away. These two sea-rovers, upon their arrival in San Francisco, went into partnership as Goodall & Nelson, and laid the foundation of a business that rapidly became the first commercial and shipping-house on the coast. In 1870 ex-Governor Perkins, then a successful merchant of Oroville and State Senator from Butte, was added to the firm. In 1876 Mr. Nelson disposed of his interest in the business and was succeeded by Edwin Goodall, a younger brother of the captain, since which time the firm has been known as Goodall, Perkins & Co. The business of this firm now extends from British Columbia on the north to San Diego on the south, and a large fleet of stanch, well equipped steamers are employed by them in the coasting trade. Captain Goodall was married February 20, 1856, to Miss Serene Thayer of New York, and a happy home and group of devoted children have been the fruit of the union. The fact that Senator Stanford selected him as one of the trustees of his munificent gift is one of the best evidences of the sterling worth of his character.

THE Truckee Lumber Company is about to build a new mill at Dog valley. The timber is about all cut near their present mill, and it will be removed further up the valley. Work has already commenced, and the dam which will form a pond is nearly completed.

CHARLES GOODALL.

and the stupid, sneer at that moral courage which pertains only to those whose really great. The explosion of two barrenos at the same time filled the bottom of the mine with sulphurous gases and with a dense smoke from the powder. A shower of stones fell around him, but he was unharmed. Putting his hands to his mouth in the form of a trumpet, he shouted in a tone which reached the mouth of the tiro—*El pegador sin novedad!* A salva of applause and of vivas saluted the valiant *alabado* of the miners. Then they sang the *alabado* (secramental hymn). Standing there, enveloped with clouds of smoke and metralas of stones, he was a magnificent figure. For the third time the tiro resounded with an explosion. The pegador replied with greater energy: *Sin novedad!* This time the salva was furious, and the *alabado* was repeated. Three successive detonations followed at short intervals; but after each he repeated: *Sin novedad!* The enthusiasm rose to frenzy and was manifested in vivas and mad shouts. No one now thought of singing the *alabado*. They were yelling, stamping and vociferating. All the barreteros who were near, the *quebradores*, *fueros* and *pepenadores*, ran to the mouth of the tiro, shouting and applauding. In truth, the man who not only once but several times had thus faced death so heroically, deserved the unbounded admiration with which they were greeting him.

(To be Continued.)

made several visits to the well at various times and had expressed himself as being satisfied, from his own personal observations, of the presence of oil and gas.

Yesterday afternoon an *Independent* reporter met Mr. Beane and asked him how work at the well was progressing.

"Well, we have unpacked the tubing and will start in again to-morrow," was the reply. "By the way," he continued, "there has been a good deal of talk about the well. Now, if you will jump into my buggy I will take you out there and show you what we have."

The reporter accepted the invitation, and in less than ten minutes he was at the well. Mr. Beane called the scribe's attention to several pools of water in the yard that were formed from the overflow from the well. At the edges of the pools a thick scum, of a dark-brown color, had collected on the surface of the water, which looked oily and was greasy to the touch. It is crude paraffine. The surface of the water is also covered with aniline, which, Mr. Beane explained, only comes from rock oil. The reporter was next shown a pile of black sand, a sample of that which had been obtained in boring. The sand was moist, and, like the water, felt greasy. It was impregnated with paraffine. The presence of such quantities of paraffine and the aniline in the water that has been pumped from the well, is, according to the testimony of the best authorities, the surest and best indica-

#### Passing Events.

The year 1888 opens auspiciously, and everywhere in California there are evidences of prosperity. The immense immigration to the State is filling up all the vacant places, and increasing the population in our cities and towns. It is expected that California will make a wonderful advance in material interests this year.

A very heavy rainfall has occurred almost all over the State during the past week. In many places the storm was accompanied by hail and snow. The snow covered the hillsides around the city of San Francisco on Wednesday and Thursday, quite an unusual occurrence in these latitudes.

As we commence Volume LXVI with this number of the PRESS, it will not be out of place to remind our readers that this is a very appropriate time to renew their subscriptions. If they can also bring the paper to the attention of others we shall be obliged.

So much snow has already fallen on the mountains that it is very probable the mining community will have a good water season. So many mills now use water for power in this State that an abundant supply is quite an important matter.

#### Whether to Buy "Prospects" or "Going Concerns."

This Denver Mining Journal takes the ground that it is better for those intending to invest in mines to buy what the English term "a going concern"—that is, a hulkion-producing mine—than a mere "prospect," however promising the latter may be, going on to say that in Colorado those buying and working mines already developed have generally fared much better than they who have hunted after deposits supposed but not absolutely known to exist.

However it may have been in Colorado, this hardly agrees with our experience in California or perhaps elsewhere west of the Rocky mountains. Our opinion is that the buyers and developers of unexplored or but little explored deposits have, as a general thing, come out better than the buyers of mines already exploited and equipped with plant. There have been successes and there have been failures in both cases, but the most satisfactory results have, we think, been reached by those who have experimented with the "prospects." It is in fact but reasonable to expect that such would be the case. Prospectors and miners take up claims for the purpose of selling them, doing only enough exploratory work in most cases to keep good their possessory titles. They are not apt to do even that much unless the claim shows some evidence of value. To suppose that these men, generally such good judges of "indications," would expend what to them are such considerable amounts of labor and money on an entirely or seemingly worthless piece of ground is a very violent presumption. The term "prospect" implies as much as this, conveying the idea that there is in it at least something to hope for.

The claim locator being then the owner of a property, possessing presumably, some value, is the party, one would think, whom intending buyers would first seek out, as he wants to sell his property and can give a good reason for it. He may ask too much for his claim, and in the first instance very likely will, but he cannot grossly misrepresent it, nor can he very well put up a job on the buyer. It would be a sorry sort of expert indeed who could go far wrong in estimating the value of a mere prospect.

Turning now to the "going concern," we find these conditions very different. In the first place it may well be asked, why should the owner of the "going concern" want to sell it, or why sell it at a price that would make it a desirable purchase by another? Of course, it is always possible to give a plausible, and often an entirely valid, reason for this. But when a party has bought a mine and gone to the expense of opening up, outfitting, and bringing it to a profitably productive condition, the above inquiry becomes pertinent, suggesting at the same time the legal aphorism, "caveat emptor," as occasionally the "emptor" discovers when it is too late. If a mistake is made in experting a prospect, no great harm is apt to ensue; but a mistake made in experting an extensive mine with all its appurtenances may be a very grave affair, and that the liability to fall into error is in this latter case greatly increased cannot be denied. Canvassing then, the hazards incident to this class of ventures, the chances of success lie, it seems to us, with the undeveloped mines, difference in first cost being, of course, taken into consideration.

Our Colorado contemporary complains that claim-holders there are in the habit of asking excessive prices for their "prospects," thereby defeating their ready sale and turning capital away from the country. If this be the case these Colorado miners are not the only ones who have the habit of standing in their own light, the practice so complained of being one that obtains very generally throughout the mining regions.

In buying a prospect, especially where the asking price is large, its acceptance by the purchaser should be conditioned on its showing corresponding value under further development, for making which he should be granted ample time. This is the manner in which these inchoate mines should always be dealt with. Such an arrangement ought to prove satisfactory to all concerned; to the buyer, because the property may disclose larger values than were at first expected, and yet involve no advance in the price originally asked for it, while he cannot, in the event of his dropping it, be a

very large loss; and to the seller because he either gets his price for his claim or he gets enough exploratory work done upon it to determine its character without its costing him anything.

The mode of procedure here suggested seems to us so eminently fit that we wonder it has not been more generally adopted by those making mining ventures, especially in California, where there are so many of these prospects for sale, where they can be developed at so little expense and generally show such satisfactory signs of wealth.

#### Sixty-Five Cent Ore Profitable.

In view of the fact that the Spanish mine, Washington Township, Nevada Co., California, has, during the past few months, been making a most remarkable record in the matter of cheap mining and milling, we have published the monthly accounts showing the expenses and profits, in detail. According to the terms of the lease all proceeds must be applied to the payment, pro rata, of the preferred claims against the mine. Mr. F. W. Bradley, the superintendent, has, therefore, to make a monthly statement under oath, and it is from these statements that we have taken the figures published.

However low the cost of milling and mining and the grade of ore in previous months, the record of November is still more startling. The idea of making any profit at all on rock only worth 65 cents per ton will surprise miners everywhere. Yet this was done in November. Moreover, a large amount of rock was crushed, not a mere sample lot, but over 4000 tons, a "working test" that amounts to something. The record for November is as follows:

MINE.			
Thirty days' work produced 4047 tons of ore.			
Cost of Production.	Labor.	Supplies.	Total.
Extracting ore.....	\$679 63	\$196 65	\$876 28
Delivering ore to mill.	193 25	13 69	206 94
Dead work.....	160 90	14 35	175 25
General expense.....	70 70	4 75	75 45
Total.....	\$1044 48	\$229 44	\$1273 92
Cost per ton.....	25 8-10c.	5 6-10c.	31 4-10c.

MILL.			
Twenty-nine days' work reduced 4047 tons of ore.			
Cost of Reduction.	Labor.	Supplies.	Total.
Mill expense.....	\$225 67	\$162 82	\$388 49
Water for power.....	5 00	198 00	203 00
Handling ore.....	177 00	2 40	179 40
General expense.....	70 71	4 75	75 46
Total.....	\$478 38	\$367 97	\$846 35
Cost per ton.....	11 8-10c.	9c.	20 8-10c.

Bullion produced.....	\$2644 57
Total expenses.....	2120 27
Profit.....	\$524 30

This shows the ore to have worked only a trifle over 65 cents per ton. The cost of mining and milling combined was about 52 cents per ton. In working this large amount of ore a net profit of only 13 cents per ton was made, the total profit being \$524 30 on 4047 tons of ore. As we have remarked before, the mine is worked under exceptionally favorable circumstances, and the ore is easily reduced; but it is surprising to know that under any conditions a profit, however small, can be made out of such very low-grade rock. Water-power is used to drive the Huntington mills, but has to be paid for. Miners who own claims of low-grade ore ought to feel encouraged at reading of these results.

**MINING REVIEW.**—We are now preparing our usual annual review of mines and mining for the year 1887, and will publish it as soon as all the statistics are available. We should be pleased to have communications from any of our readers in the mining districts, giving us any notes of progress in their respective camps. In some of the mining districts on this coast there is very little said simply because those interested in the camps do not occasionally write concerning it. We shall be glad to publish in our review any notes which we may receive. We should like them at once, however, since the matter is now being prepared.

**STATISTICS of San Diego for 1887** show that the amount of freight arriving by land and sea during 1887 was 145,000 tons, as compared with 43,000 tons in 1886; 82,500 passengers arrived by land and sea during the year, and 22,000 in 1886; the number of ships arriving in the harbor during 1887 was 1500, and during 1886 350; 153,000,000 feet of lumber arrived in 1887, while in 1886 but 38,000,000 arrived, and in 1885 15,000,000. The value of buildings erected in San Diego and vicinity was \$6,000,000 in 1887 and \$1,250,000 in 1886.

#### Pacific Coast Steel.

In his annual report the Secretary of the Navy called attention to the superiority and excellence of the steel made on the Pacific Coast, which is being used in the construction of the Government cruiser. This is a high compliment to California, and especially to the Pacific Rolling Mills, where the steel was made. The results of the tests show some remarkable features.

The tests of the steel were made by Lieut. Gilmore, U. S. N., who was sent by the Government on special duty during the construction of the cruiser Charleston. Four test pieces are taken from each heat. In the following table, which is from official records, the figures of the average of each four tests are given:

Material.	Tensile Strength. Per Sq. Inch.	Elongation. Per Cent. a.
Angles.....	61,505	30.7 in 8 inches.
".....	60,890	30.54 " "
".....	60,905	30.21 " "
".....	60,175	30.37 " "
Hull rivets.....	54,265	31.69 " "
".....	53,215	31.43 " "
".....	52,445	31.80 " "
Boiler shell rivets.....	60,250	28.07 " "
".....	61,410	29.9 " "
".....	61,600	29.0 " "
Stay rods.....	63,850	24.03 " "
Miscellaneous forgings.....	63,137	24.87 4 " "
Cast-steel stern-post.....	74,670	19.75 3 " "
" ram.....	64,370	18.12 8 " "
" stem.....	61,580	19.2 3.2 " "

The angles are the frames for the ship. The results obtained in ductility are much in excess of that required by the specifications, the requirements being 25 per cent in eight inches. The case is similar with the hull rivets. The superior quality of the rivet material is shown by the fact that no rivets have been lost after being driven into the ship. With ordinary material more or less are broken or defaced. The stay rods are for the boilers, and the figures show the degree of excellence of the steel.

The miscellaneous forgings of steel are used in making different parts of the engines, etc. The Pacific Rolling Mills Company has caused for congratulation in the success it has achieved in making the steel castings, since they give extraordinary results in tensile strength and elongation. It has been the desire in building the Charleston to substitute steel castings for forgings as much as possible, as well as steel castings for iron castings.

The Secretary of the Navy of course has his remarks on the excellence of the steel on the report made by Lieut. Gilmore. The figures we give above we take from a copy of the report in this city. The Rolling-Mill Company have done everything possible to turn out the very best steel, and it is a matter of congratulation that they have succeeded so well.

#### The Yield of the Comstock.

We have received from Dr. James Delavan, mining engineer, of Virginia City, Nev., a compilation of statistics in reference to the Comstock lode, which has been prepared after a lengthy research of all available sources, and the use of an immense amount of figuring. It will be of interest, as the statements can be relied on as correct as can be possibly obtained, therefore we lay it before the readers of the PRESS. The calculations are from the year 1860 to 1st of December, 1887. Total yield of mines on the great Comstock lode from ore reduced at mills, without including slimes and tailings yield, as all that went to the mill-owners and not to the benefit of stockholders, was \$239,219,553.

Dividends paid..... \$126,431,076  
Assessments levied..... 87,615,460  
Dividends above assessments..... 68,815,510  
Amount expended above assessments, proceeds of mine..... 110,783,483  
Total expenditures..... 169,493,943  
Yield of tailings and slimes, net..... 35,000,000  
Total product of mines..... 305,000,000

**COAL** continues scarce and very high, though the market is not as sure as it was a fortnight ago. It is still sufficiently scarce, however, to create a general scramble among dealers for supplies whenever a cargo arrives. Vessels are now being engaged to go to Australia for coal, and as ships are being chartered there for this port, it is hardly probable that the scarcity will become more extreme.

**TUSCARORA MINES.**—The statement recently published to the effect that work on the Navajo Queen, Seal of Nevada and East Grand Prize mines, Tuscarora, Nev., had been suspended for the winter is incorrect. They are pushing work on both the Navajo Queen and Tuscarora Con. and expect to do considerable on the East Grand Prize this winter.

## Publications of the Lick Observatory.

Volume I of the Publications of the Lick Observatory of the University of California has just been issued. It was prepared under the direction of the Lick trustees by Edward S. Holden, LL. D., president of the University and director of the Lick Observatory. The work was printed at the State printing office, and is of excellent typographical appearance. A brief description of the observatory in its present state is given and a short history of the work which has been done. There are several illustrations of the appliances connected with the observatory. The descriptions of the clocks are specially interesting. As a general thing, Americans have to go to Europe for pieces of mechanical work, such as are in small demand here—astronomical clocks, for instance. The only reason is, that in order to get the parts of accurately right dimensions and weight a great deal of time is consumed, and our labor is high-priced, or that it "does not pay" to do much of this work here. There are two clocks by Hohn, and engravings from drawings furnished by the maker give the essential features of the pendulums, etc. The drawings and description of the essential features were asked for by Prof. Holden, and they are presented in this volume, so that any one can make the pieces, the weights, etc., being given. The pendulum of the Frodsham astronomical clock is also figured.

The most valuable portion of the volume to the scientific reader, and what will most interest astronomers, is embraced in the various tables. As a general rule, during the first year of practical work of an observatory, a large amount of time is consumed in preparing necessary tables. But the astronomers will find all this done for them by Prof. Holden. The tables are the most complete ever published, so that the work ought to be reduced with great accuracy. Any one who will examine these tables intelligently will readily understand that Prof. Holden has certainly occupied well what time he could spare from active duties at the University, since he became president.

Following the description of the instruments, the hitherto accomplished work, and the complete meteorological record, came the "Reduction Tables for the Lick Observatory" by George Cary Comstock; latitude  $37^{\circ} 20' 23''$ , 1883." These exceedingly complete tables were computed while Prof. Holden was at the Washburn Observatory at Madison, Wisconsin; as the title states, they were done under Prof. Holden's direction by Mr. Comstock, and comprise all the quantities which can possibly become necessary in the routine computations of the observatory, with several special investigations of a high order. Mr. Comstock, it may be stated, has since become professor of astronomy and mathematics at the State University of Ohio.

From the introductory note and the addendum thereto, we glean the following data concerning the geographical position of the observatory, which have been furnished Prof. Holden by the computing division of the United States Coast and Geodetic Survey, through Prof. George Davidson of this city:

Latitude..... $37^{\circ} 20' 24.75''$   
Longitude..... $121^{\circ} 38' 36.82''$

These are given for the center of the collimating basin of the Fauth Transit in the "Transit House," additional figures are tabulated for similar co-ordinates of all the principal instruments in the different buildings, such being the proportions of this great institution that the "positions" of the instruments in different parts of the building range as much as  $2\frac{1}{2}$  in latitude (230 feet), and  $1\frac{1}{2}$  in longitude (125 feet). The elevation of the top of the small dome (which was the object observed

upon by the different officers of the coast survey) is given by Mr. Scott, the head of the computing division of that bureau, as 1295.31 meters above the half-tide level of the Pacific ocean.

This figure, reduced to the marble floor of the main building, results in an elevation for the observatory of 4209.37 feet. All these figures are part of the standard data of the main triangulation work of the Coast Survey, are free from "local deflection," and must be of exceeding accuracy. At the same time it will be interesting to find from observations at the observatory itself to what extent the plumb-line is inclined by the attraction of the surrounding mountain masses; apparently this has not as yet been investigated.

Table I gives the star factors, *A*, *B*, *C* and *D*, for every  $10'$  of declination from  $47'$  to  $40'$  south declination to north  $80'$ . These are the usual factors for azimuth, level and collimation of the transit instrument; the fourth quantity, *D*, is the numerical value of the tangent of the declination, which is used in the computation by Bessel's method, wherein the "constants" of the transit are supposed to vary but little

SECTION SHOWING HOW PERMEABLE STRATUM FROM MOUNTAINS MIGHT SUPPLY WATER.

and are known. The second part of the same table includes the same factors for every individual star of the Berliner Jahrbuch, computed for the period 1900, and with the changes for 100 years.

Tables III, IV and V comprise extensions of Bessel's well-known refraction tables, with corrections for the atmospheric and barometric conditions prevailing at the altitude of the observatory; also differential refractions in right ascension and declination for the circle and micrometer observations. They are preceded

## A Year of Large Promise.

The new year opens auspiciously for all the leading industries of California, the copious and widely distributed rains that have greeted its advent being of hardly more importance to agriculture than to mining, which latter has, in several of its branches, come to be largely dependent for success on an ample and well-sustained water supply. This apply may now, so far as the miners are concerned, be considered assured, as the snowfall on the mountains has already been heavy. It is these early snows which, becoming impacted, long resist the rays of the sun, and thus keep the mountain streams well replenished until late in the summer. However heavy the snowfall later in the season, it contributes little to that end, since the days then being long and the snow being loose, the heat of the sun causes it to melt rapidly. With so good a stock of what will be old and greatly solidified snow in the spring, a prolonged water season may be considered assured to the miners the coming summer. As a consequence of this favorable condition of things a large and profitable production of bullion may be counted

## Artesian Wells in Mexico.

In his description of the Sierra Mojada mining district, Mr. Richard E. Chism discusses the question of water supply for artesian wells at some length, as it is of more or less interest to other Mexican districts similarly situated. He gives the elevations along the Mexican Central R. R. and approximately those of the great sink. He thinks it would be very much within bounds to assume that any water-bearing stratum from the Sierra Madre must pass at least 300 meters below the surface of the "rock," and that therefore, under the Mexican Central R. R. such a stratum, if it exists at all, would be at most 800 meters above the sea level. The horizontal distance from the railroad to the 1500-foot contour on the eastern slope of the Sierra Nevada is about 125 miles, so that if the water-bearing stratum should have its absorbing outcrop at or near that elevation, it would fall about 18.5 feet per mile, or 0.35 per cent. Supposing it to dip eastward from the railroad with a less inclination, say 10.6 feet per mile or 0.2 per cent, it would, under Sierra Mojada 75 miles away, have an elevation above sea level of only 560 meters.

The elevation of Sierra Mojada is 1845 meters, so that any water-bearing stratum from the Sierra Madre must lie at the depth of 925 meters (3034 feet) below the level of the town. This is indicated in the ideal section shown in the engraving. The cut shows an ideal section across Mexico, showing how a permeable stratum of rock from the Sierra Madre might pass under the Sierra Mojada.

It is probable that the water, in passing through the rock strata for such long distances (75 miles in one instance, 200 miles in the other), would lose the greater part of its head; and that at Sierra Mojada it would rise only a comparatively short distance in the bore-hole, and stand, in case of the deeper hole, at about 1600 feet, and in the more shallow hole at about 1900 feet from the surface. Consequently, the water would have to be pumped up from these depths to the surface.

So far as the general discussion is concerned, it could make no difference at what point in the Sierra Mojada valley an experimental bore hole were located, since, theoretically, they are as likely to strike water in one place as in another. Mr. Chism thinks it

VARIOUS FORMS OF ENGLISH SMELTING FURNACES.

by a discussion on the theory by Prof. Comstock, who has elaborated all the terms of the formulae to meet all possible conditions.

Table VI is an extended tabulation of the Sun's parallax in right ascension and declination, with auxiliary lists for extending the tables to other parallaxes of the heavenly bodies, and for adapting the same tables to other observatories.

Table VII gives the hour angles and azimuths of a body in the horizon; and VIII the true zenith distances for the latitude and elevation of the Lick Observatory.

Tables IX to XIV are tabulations of several quantities useful in abridging the work of computation, to be undertaken by Prof. Holden and his assistants; and the six other tables which conclude the list are copied from the Leipzig observations (as stated in the introduction), and do not particularly appertain to the location of the Lick Observatory. A table of corrigenda follows, which covers all the errors detected up to the time of going to press.

Altogether as a contribution to scientific literature the volume is a worthy one, and reflects credit upon its author and the Lick trustees. It may probably be considered as an earnest of the character of future publications of the observatory, so that its high order is one upon which citizens of California may congratulate themselves.

true, but there is reason to believe these mishaps will be less common than heretofore. With each successive year they are, in fact, diminishing in number, having become now so few that they do not count with much force against an industry so widely extended and yielding such grand results in the aggregate. Happen what may, we are firmly of the opinion that looking back at the close of 1888 it will be found that the year has added more to our stock of bullion than was done by any of its predecessors.

CONGRESSMAN MORROW recently called upon Secretary Whitney and discussed the question of the Government purchasing naval stores for consumption on the Pacific Coast in the East, while the same could be procured in San Francisco and other points at the same figures. The Secretary remarked that the injustice of this discrimination against Pacific Coast merchants was apparent, and he would do all in his power to have the matter adjusted.

NEVADA COPPER.—Owing to the revival in the copper market, it is the intention of the company owning the copper mines in Lone Mountain district, Elko Co., Nev., to commence work at once and work them for all they are worth. The deposits of carbonate and oxide of copper ores there are simply immense.

may safely be concluded that there is only a remote possibility of securing water in Sierra Mojada by boring; that if encountered at all, it would be at great depths and would have to be pumped to the surface, and that the probability of the case do not warrant expensive experiment.

## Blast Furnaces.

We have made a number of extracts from Mr. Edward Walsh's paper on the "Irregularities of the Blast Furnace," in which he figures various forms of furnaces. The engraving shows forms of English furnaces, which is from Gruner's "Studies of Blast-Furnace Phenomena." The furnaces are so shown that a comparison of form is readily made. It has previously been stated that there is very little uniformity in the American practice, and, judging from the cuts, there is no more in the English practice. Mr. Walsh himself says that out of some 670 blast furnaces in the United States, there are at least 500 distinct and individual designs. There is, to say the least, a great diversity of opinion as to the proper shape of the blast furnace, though it would seem, after all the experience, that some "survival of the fittest" would have occurred before this.

THE public debt was diminished during the past year \$117,916,000.

## MECHANICAL PROGRESS.

## Babbitt Metal.

We gave quite a lengthy article on babbitt metal in our issue of February 26th last. We now add the following additional items which we find without credit:

This composition of babbitt metal is a question about which there seems to be much confusion and diversity of practice; and the mechanic who undertakes to find out from the makers and users of the alloy just what it is composed of, and in what proportion, will probably receive many and diverse answers.

Many shops make their own babbitt, each one by a formula differing from most all the others; and in this way different specimens may be met with, varying from a mixture of eight parts of lead to one of antimony at one extreme, to one containing no lead and considerable copper and tin at the other. Even the manufacturers and dealers will offer for sale "babbitt metal" in bars at prices ranging from 10 to 75 cents per pound; and they will insist that it is all "babbitt metal," only different qualities.

Now, if any one wishes to use as a lining for boxes an alloy which can be sold as low as 10 cents per pound, of course he should be granted the privilege; but when he calls the stuff babbitt metal he deceives himself or some one else.

We often hear the expression good babbitt, poor babbitt; but there is really but one babbitt metal, and if any alloy is either much better or much worse than that, it is not babbitt, but something else. Different authorities give various formulas for the composition of the metal, but the following is considered to be the standard babbitt metal:

Melt separately 4 parts copper; 12 Banca tin, 8 regulus of antimony. After fusion, add 12 parts tin. This antimony should be mixed with the first portion of the tin, and the copper added after taking the melting-pot from the fire. The surface of the charge should be protected from oxidation by a covering of powdered charcoal.

This mixture constitutes the "hardening," and the babbitt metal is made by fusing one part of this hardening with two parts of tin, thus making the metal consist of 3.7 parts copper, 7.4 parts antimony, and 88.9 parts tin.

## Power in the Future.

What will turn the wheels of our mills 20 years hence? Will it be water, steam or electrical energy? It needs a bold mind to set limits to the inventive genius of this age. A generation that has seen the telephone and the electric light evolved from the study of the inventor can hardly sit in the chair of the skeptic regarding the possible triumphs of minds to come. Pause a moment. Was ever a more marvelous invention thought of or prophesied by an Edgar A. Poe or a Jules Verne than the telephone? Analyze that invention for a moment and see what a palpable contradiction of old-time science it involves. Yet it is now an accepted fact of every-day life.

Edison's Thermo-magnetic Dynamo is but a prophecy of what the scientific minds of this present age regard as the inevitable outcome of scientific research. Edison's invention for utilizing fuel without the intervention of steam is simply a stepping-stone to the era when electrical energy shall take the place of our present incomplete methods of producing power. That the world should have stumbled on for a century in ignorance of the inexhaustible sources of power in electricity all around us, will possibly be the wonder of wonders to the next generation.—*American Miller.*

MECHANICAL PROGRESS.—A commercial contemporary, in endeavoring to show the progress which has been made in mechanical work, gets off the following: "The march of progress is shown by the following statement: It is now possible to construct a complete sewing machine in a minute, or 60 in one hour; a reaper every 15 minutes or less; 300 watches in a day, complete in all their appointments. More important than this even is the fact that it is possible to construct a locomotive in a day. From the plans of a draftsman to the execution of them by the workmen, every wheel, lever, valve and rod may be constructed from the metal to the engine intact. Every rivet may be driven in the boiler, every tube in the tube-sheet, and from the smokestack to the ash-pan a locomotive may be turned out in a working day, completely equipped, ready to do the work of 100 horses." This statement is both misleading and erroneous. No such feats have ever been accomplished or are possible. The error, no doubt, grew out of the statements, which are no doubt facts, that certain firms do turn out so many machines in an hour or a day. But there is a very great difference between turning out a sewing machine from a large manufacturing every minute and constructing one entire in a minute, an hour or a day. The one is quite possible, the other utterly impossible. There are establishments where locomotives can be turned out at the rate of perhaps two a day, but it is utterly impossible, and always will be, to complete a locomotive in a day, or perhaps even in a week.

TO MAKE IRON TAKE A BRIGHT POLISH LIKE STEEL.—Pulverize and dissolve the following

articles in one quart hot water: Blue vitriol, one ounce; borax, one ounce; prussiate of potash, one ounce; charcoal, one ounce; salt, one-half pint; then add one gallon linseed oil; mix well; bring your iron or steel to the proper heat and cool in this solution. It is said the manufacturers of the Judson governor paid \$100 for this receipt, the object being to case-harden iron so that it would take a bright polish like steel.

## What a Good Sawmill Man Requires.

A great many sawmill men lose sight of some of the essential requirements of their business. The following sensible remarks on this subject are reproduced in our columns from the *Timberman*:

One who would run a sawmill successfully in these times must combine many different qualities and possess a knowledge that is not made up altogether of an acquaintance with saw-logs, or even with lumber after it is cut and ready for sale. He must be something of a millwright and a pretty good mechanical engineer in certain points of the theory of that profession, to say the least. He is frequently called upon to judge of the merits of a mill, and needs have such an idea of mechanics that he can tell a good machine from one that is not good—it is to be supposed, of course, that there are no absolutely bad ones in market. And this requires faculties that are trained in criticism and discrimination; that are quick to note the good and bad points of any special device and to judge its effectiveness and economy. As a lumberman remarked the other day, a buyer of machinery is something like the judge of a court, whose business it is to hear all sides fully and then decide according to his idea of what is right. The millman of experience looks into every new machine that is presented to him, carefully listening to all that is said in its favor, then to what the makers of other similar machines have to offer in their behalf, finally deciding upon his purchase when he has settled in his own mind, and "on the evidence," which one will best suit his requirements. That this calls for high order of judicial talent no one will deny; and when it is remembered that a millman's profits are but the result of successful economy and that a failure in this regard is pretty surely a failure altogether, it is apparent that he can afford to make but few mistakes. The high efficiency to which sawmills have attained is very largely due to the fact that he does make but few mistakes.

CIRCULAR SAWS FOR CUTTING METALS.—There probably is not an intelligent sawmill man in the United States who is not familiar with the inserted-tooth saws for cutting lumber; but few of them, perhaps, are aware that our English relations have inserted-tooth saws for cutting iron. One of these machines, as recently illustrated and described in a London engineering journal, has a saw composed of a circular steel tool-holder or plate, eight feet in diameter and one inch thick, having recesses on its circumference to receive special tools which are made with a flat V groove on one side to prevent lateral movement; these cutters are held in position by steel wedges, the circumferential adjustment being made by set screws, and they are adjusted to cut alternately on this face and the edge to give the required clearance. The face tools are arranged to cut in steps so that each one has its own work to do instead of following in the groove of the preceding tool; a special gauge is provided for grinding and setting each tool. The tool plate is carried on the end of a very strong steel spindle running in hard gun-metal bearings, the one nearest the plate being arranged with thrust collars to prevent any side play. The spindle is driven by a massive worm and wheel. The saw will cut through 12-inch steel castings at the rate of seven inches per hour.—*Wood-Worker.*

AMERICAN PLATE GLASS.—It is claimed that the largest and best plates of glass in the world are now made in Pittsburgh, and that difficulty often arises in their transportation owing to their size, the railroad tunnels not admitting them. Two plates, 14x16 feet, were recently ordered for use in a Philadelphia building, and it was found to be impossible to get rail transportation for them. Arrangements were therefore made to have them shipped by river to New Orleans and thence by sea to Philadelphia.

WISCONSIN SENDING ENGINES TO RHODE ISLAND.—Wisconsin machine shops turn out engines for Rhode Island manufacturers. The latest engine furnished was an enormous one, the fly-wheel 32 feet in diameter, and the face nine feet three inches. The largest of four steam cylinders recently furnished has a diameter through which a tall man with a silk hat on could walk. The Western machine shops are teaching the Eastern shops to do big things.

TO DETECT ACIDS IN LUBRICATING OILS.—Acids in lubricating oils can be detected as follows: By analyzing in a laboratory, or by putting the sample to be tested in a clear glass bottle with a copper wire running down through the cork air-tight. Stand the whole in a sunny place and leave for two or three weeks; then if on removal verdigris or green rust be on the copper there is an acid in the oil. This is a rough, effective test for engine-room use.

## SCIENTIFIC PROGRESS

## The Three Forces—Physical, Vital and Psychic.

[No. 14.]

[Written for the Press.]

Muller, a Danish naturalist, observed almost a century ago that a certain marine worm was able to divide itself into two parts and on some occasions into four; these parts after separation continued to live. The oldest part, i.e., that nearest the head, did not contain any eggs. Eggs were confined to those parts which became separated.

Milne-Edwards\* has confirmed Muller's observation. We give an example from him of the *Myrianida fasciata*. It was discovered by him and is described in his "Voyage en Sicile," pl. vii, fig. 65. No. 1, oldest, No. 6, youngest.

There are in this worm no less than six young attached to the older one, and all developing at the same time. Those farthest from the head of the original stock were the oldest, and each was possessed of a certain number of segments and a pair of eyes. The oldest has more rings in proportion to its age; these keep forming during the development of the animal; the joints of the first-formed young are developed between the last joint of the old stock and the one before it. The next oldest is formed by the successive appearance of a series of joints between the head of the first young and what was the next to the last joint of the parent, and so on. This mode of separation has been termed fissiparation. (From *fissus*, divided, and *gemmatus*, budded; a growth by the hudding and dividing of a compound body.)

To the rings of this body are attached appendages for propulsion; these also serve the purpose of gills. They are enabled to perform the function of breathing through having minute branches of the bloodvessels distributed through them. The intestines extend right through the body, and is surrounded by a network of bloodvessels. All these bloodvessels are connected with a larger, canal-like one, which runs along the back of the intestine; this is called the heart. A cord of nervous tissue runs from joint to joint, and forms a small ganglion at each. The principal ganglion (the early indication of a brain) is situated in the head; this is connected with the *nervous collar*, near the throat, which is common in all the lower types. The position of the brain with regard to the nervous system, as seen in the different types, will be given with a complete set of diagrams when we come to the vertebrate series.

Three classes of facts lead us to the conclusion that all articulate animals are composed from end to end of homologous segments: 1. The correspondence in the successive segments of their parts. 2. The correspondence as it exists in the embryonic or larval articulates animal in even a more marked condition. 3. The maintenance of such correspondences in some type, which are absent in type otherwise near akin to them. We have in the *Articulata* a longitudinal integration (in the *Calenterata* and *Mollusca* we have seen that there is a clustered and branched integration). This longitudinal integration is still observable as we ascend to the higher insects, as we hope to make plain in our next paper.

\*Henri Milne-Edwards, who was born at Bruges, 1800, is one of the most eminent representatives of the French school of Natural History. As President of the Faculté des Sciences he has done much to advance the study of comparative Anatomy and Zoology in France. His principal works are: "A Monograph of the Crustacea" (1837-1841); "Elements of Zoology," 4 vols., 600 illus.; and "Comparative Anatomy of Men and Animals" (1856-1857). One of the profoundest naturalists of the age. Such is the general verdict.

(To be Continued.)

THE THEORY OF THE TELEPHONE.—M. Coran has presented to the French Academy a memoir by M. E. Mercadier, on the theory of the telephone. M. Mercadier maintains that the transmission of articulate speech is chiefly, if not solely, the result of molecular motion in the plate of the receiver. Vibrations of the plate as a whole are only capable of yielding a single tone and its harmonics; this tone remains

unaltered when the plate is supported at various points which are nodal points for this particular note; but under these circumstances the transmission of other tones is much lessened. Such an instrument M. Mercadier calls a monotelephone. On the other hand, a diaphragm supported in such a manner as to be incapable of performing transversal vibration is still able to transmit speech with perfect clearness, although with considerable diminution of intensity.

## Industrial Prizes in France.

The French *Société d'Encouragement* offers prizes for discoveries and inventions which are of value to French industry. Among them are the following:

Prizes, \$200 each:

1. For the utilization of residue in factories.
2. For the discovery of a new alloy for industrial purposes.

3. For the useful application of metals which have hitherto been only used to a limited extent for industrial purposes.

4. For the construction of a heating appliance to produce, in small industrial workshops, elevated temperatures by a quick and economical method.

Prizes of \$400 each:

1. For a small motor for workshops, acting for itself, or in connection with a larger factory.

2. For improvements in the usual form of grain-mills.

3. For a motor for heavy oils.

Prizes of \$600 each:

1. For a mode of transmitting natural mechanical forces over long distances, when their immediate utilization is impossible.

2. For the manufacture of glasses for chemical purposes.

3. For the construction of a simple and solid appliance which will indicate the progress of a train at any distance, in a reliable, automatic, and regular manner.

Models, etc., must be sent to the secretary of this society, 44 Rue de Rennes, Paris. Those who wish to compete are reminded that the communication of processes to the society does not afford them the protection of a patent, which should be applied for before they enter for competition.

UTILIZATION OF FIRE DAMP.—It is very interesting to see fire-damp, the most dreaded enemy of miners, reduced by the genius of man to be his agent and servant, as has been done in Germany recently. The Wurm coal mines, near Aix-la-Chapelle, are particularly noted for the amount of fire-damp produced in them, and the minutest precautions had to be taken to prevent dangers that, notwithstanding this, were to be feared. Mr. Hilt, director of the mines, undertook the work. He constructed a line of piping that ran in front of all the centers of work and ended in a main pipe connected at the surface with a powerful suction pump. But it was not enough to get rid of the noxious gas with money—it was necessary to utilize it; and so Mr. Hilt conceived the ingenious idea of causing the conduit to end in a gasometer. Upon isolating the latter, and placing wire gauzes here and there in the conduit, he was enabled to lead the gas to the furnace of two generators and use it to help heat them. We are obtaining, says the director, 30,500 cubic feet of fire-damp, which distill 263 cubic feet of water. On uniting the fire-damp of all our exploitations, we shall have 64 cubic feet per minute, and shall be able to distill 5260 cubic feet of water per 24 hours. The utilization of fire-damp thus stored may become advantageous from a commercial point of view. It may serve not only for gas motors, but also, with well-constructed burners, for lighting purposes.—*La Nature.*

INCREASING USE OF BISULPHIDE OF CARBON.—M. Pasteur anticipates that bisulphide of carbon will become the most efficacious of all antiseptics, as it is also the cheapest, costing but a fraction of a penny per pound in large quantity. It is also the best insecticide known, and for this purpose may perhaps be useful in preserving woodwork in tropical countries. Some idea of the use it is already put to may be gathered from the fact that over 8,000,000 pounds of the substance are used annually to check the ravages of phyloxera. Carbon bisulphide, as first produced, is about as foul-smelling a compound as it is possible to find; but it is capable of purification till all offensive odor is removed and it is sufficiently pure in smell almost to mix with a perfume.

THE MIRAGE OF SOUND.—M. Fizeau, of the French Academy of Sciences, calls attention to a curious acoustic phenomenon, which is sometimes observed at sea, and to which, from its analogy to the well-known phenomena of light, he terms the "mirage of sound." Under the influence of strata of air of various temperatures, he finds that the sound waves may be deflected upward to a very marked extent. He considers this phenomenon responsible for the numerous recent collisions between ships provided with powerful fog-signals.

FLEXIBLE GLASS.—What is termed flexible glass is a useful product just introduced. Paper of proper thickness is rendered transparent by soaking in copal varnish, and, when dry, is polished, rubbed with pumice-stone, and a layer of soluble glass is applied and rubbed with salt. The surface is as perfect as glass.

## ENGINEERING NOTES.

**MARINE ENGINE ECONOMY.—**INTERESTING EXPERIMENTS.—An interesting example of the comparative economy of the old and more modern styles of oscillating marine engines was lately furnished by an instance quoted by J. W. T. Harvey, before the engineering section of the Bristol Naturalists' Society. The *Juno* was originally worked with a jet condenser; after a time this was replaced by a surface condenser, and finally the engines were compounded. Thus we have the same vessel working under three different conditions, and any alteration of coal consumption must be due to the changes in her machinery. The engines originally worked at 30 lb. per square inch, and indicated 1605-horse power; they drove the vessel at 14.1 knots, using 92 tons of coal per voyage. Subsequently new boilers and a surface condenser were fitted to the ship, the pressure still being 30 lb.; the same horse-power and speed were then maintained with a consumption of 8½ tons of coal per voyage, a saving of 7½ tons or 9 per cent. As competition in the carrying trade became keener this coal consumption could not be afforded, and it was determined to compound the engines as inexpensively as possible. One of the existing 60-in. cylinders was replaced by another of 40 in. in diameter, and this together with two sets of link motion, two feed pumps, a steam starting engine, and a pair of cylindrical boilers working at 50 lb. pressure, constituted the whole of the new parts. The engines now gave 1270-horse power, or 335-horse power less than before, and drove the ship at 13.4 knots, or 7 knots slower, on a consumption of 49 tons of coal per voyage. The coal consumption per horse-power therefore varied under the three conditions as 100:91:67. The consumption per voyage varied as 100:91:53.—*Engineering*.

**THE GREAT CANAL SCHEME OF THE ORIENT.**—The proposed canal between India and Europe by way of the Euphrates Valley, the Persian Gulf and Syria, has been discussed in all its bearings by the French Academy of Sciences, a communication on the subject from M. Eude forming the basis of the discussion. The line marked out by M. Eude is stated to be what was the great route of commerce in ancient times, hence the founding and development of Alexandria diverted it on Suez, eventually leading to the Suez canal. This new route is avowedly put forth as a parallel way to that of Suez, and the project contemplates, in fact, a canal with a double aim, viz., a canal of irrigation and navigation—and by which means it is expected that fertility will be restored to those wastes. The plan is to create a river from Soueidiyah to the Persian Gulf, by making the Euphrates flow to the Mediterranean by Aleppo and Antioch; from Beles, in deepening the river from Beles to Felondjah, near ancient Babylon; in passing from the Euphrates to the Tigris by the canal of Saklavijah; and lastly, in descending the Tigris from Bagdad to Kurnah, Bassora, and Fao on the Gulf. Such a canal would shorten the going and coming voyage to Bombay by six days; and, notwithstanding the vastness of the work, the engineering difficulties are not considered extraordinary, except the stony banks of Abou-Said and Kerheleh, which, however, would not resist modern appliances.

**ENGINEERING INDUSTRIES IN SWEDEN.**—Several of the large Swedish engineering establishments appear to be well off for work at present. The Atlas Engineering Co. has just contracted with the Blekinge Railway Co. for 10 passenger and 85 goods carriages. The Metals Works have just completed another delivery of locomotives to the State railways; seven more are to be delivered on the same contract. The Bergsund Engineering Co. is busy with three mining boats for the Royal Swedish Navy, that have to be ready by the spring. The Ljusne Engineering Co. has just delivered a large new steam pump to the Kunsankoski Co., Uti, in Finland. The construction is quite a new one, claiming to possess several advantages over the older models. The same well-known firm has also delivered a portable steam fire-engine to the South Ljusne Iron Works within the last few days, which gave the greatest satisfaction at the trial. Some of the steel and iron works also appear to be well filled with orders.

**THE CHANNEL TUNNEL.**—The long pending project of a tunnel under the channel between England and France is still agitating the British mind, and the "old crusted-port wine gentry" are still denouncing it as if it were a diabolical plot to hand the country over to the terrible Gauls. But in spite of the singular terror with which the thought of possible railway connection with the continent inspires the old fogies and which has for years succeeded in defeating permissive legislation, public opinion is said to be growing more favorable to the enterprise and the projectors have the capital ready to proceed with the work as soon as the Government will consent. It is a singular spectacle in this progressive century to see the people of a powerful nation actually prohibiting a great engineering work simply for fear that another nation might take advantage of the facilities for access through a hole in the ground and come over and whip them.

**A ONE-INCH SHAFT.**—A one-inch wrought-iron shaft eight feet long will transmit five-horse power, running about 600 revolutions per minute.

## USEFUL INFORMATION.

## Strange Disintegration of Marble.

Some few weeks ago, water was found trickling through the roof of Girard College, Philadelphia, which is constructed of marble. An examination showed that the joints of the great marble slabs which formed the roof were parting. The stones, when placed in position in 1845-46, had been dovetailed together, and their parting was supposed to be caused by the constant use of the roof by crowds of visitors as a point of observation.

As a result of this onerous observation, says the *Philadelphia Press*, workmen were sent to repair the roof by forcing the slabs into position again. Then the surprising discovery was made that the marble itself was crumbling. The stone in all parts of the great flat surface was so decomposed that a piece an inch square could be crushed between the fingers. In fact, the whole roof seemed to have become little more than a mass of lime.

When this curious phenomenon was reported to the Board of City Trustees there was an animated but quiet discussion of what should be done. To build a new marble roof would cost nearly \$200,000, with the prospect that it would only decay in turn. Careful examination showed that the walls and steps of the college building had not been affected as was the roof. It was finally decided to cover the marble roof with heavy sheet tin, and the contract for this work has been awarded at a price of about \$9000. The necessary wood-work for the metal roof is already in place.

## The Only Marble Roof.

Naturally the discovery that the marble had rotted until it was thoroughly porous has caused a great deal of comment among builders. Marble roofs are not common. In fact that of Girard College is the only one in the city. But there are many buildings of marble, notably the new City hall, and the query was made whether the citizens of Philadelphia are to awake some morning after a rainstorm to discover a mass of slaked lime in the middle of Penn square. If a marble roof should thus decay, why should not marble walls? Might it not become necessary to erect a huge canopy of tin to house the public buildings?

Architect Windrum, however, after a careful examination, assured the Committee on Buildings of the Board of City Trustees that the rest of the college was in no danger.

## The Cause of the Disintegration.

Joseph L. Caven of the Board of Trustees says: "There is no cause for alarm whatever. Marble is carbonate of lime. The air in that region has contained sufficient acid, as a result of burning anthracite coal, to disintegrate, gradually, the carbonate of lime. The same effect is not perceptible upon the walls nor upon the Corinthian columns. The reason is that the roof of the college has a very slight pitch. In fact, it is almost flat, and while its slope is steep enough to shed water, dampness easily clings to it and aids the action of the air. Then, too, visitors to the college have always been allowed to go upon the roof. The view there is very extensive, and the visitors walked all over the top of the building. When you remember that this has been going on for 40 years, it is not surprising that the marble slabs are affected."

## About "Salt."

"Let your speech be always with grace, seasoned with salt."

For relief from heartburn or dyspepsia, drink a little cold water in which has been dissolved a teaspoonful of salt.

Sprinkling salt on the tops and at the bottoms of garden walks is said to keep snails from climbing up or down.

For weeds in the grass, put a pinch or two of salt in the middle of each, and, unless a shower washes it off, it will kill the weeds.

Ink stains on linen can be taken out if the stain is first washed in strong salt and water and then sponged with lemon juice.

In a basin of water, salt of course will fall to the bottom; so never soak salt fish with the skin side down, as the salt falls to the skin and remains there.

For stains on the hands nothing is better than a little salt with enough lemon juice to moisten it, rubbed on the spots and then washed off in clear water.

Salt and mustard, a teaspoonful of each, followed with sweet oil, melted butter or milk, is the antidote for Fowler's solution, white precipitate of arsenic.

For weeds in pavements or gravel-walks, make a strong brine of coarse salt and boiling water; put the brine in a sprinkling-can, and water the weeds thoroughly, being careful not to let any of the brine get on the grass, or it will kill it too.

If a chimney or flue catch on fire, close all windows and doors first, then hang a blanket in front of the grate to exclude all air. Water should never be poured down the chimney, as it spoils the carpets. Coarse salt thrown down the flue is much better.—*Good Housekeeping*.

**A READY WAY TO MAKE ICE.**—Take a cylindrical earthen vessel and pour into it 3½ ounces of commercial sulphuric acid and 1½ ounces of water, and then add one ounce of powdered sulphate of soda. In the center of

this mixture place a small vessel containing the water to be frozen; then cover the vessel and, if possible, revolve the whole with a gentle motion. In a few moments the water in the smaller vessel will be converted into ice. The same mixture can be used a second or third time for making a block of ice. The operation should, if possible, be performed in a cool place—in a cellar, for example.

**THE FIRST WIRE BELTING.**—The first piece of belting made with wire has been made at Beaver Falls, in the adjoining county of Beaver, Pa., by J. E. Emmerson and Thomas Midgeley, under patents taken out by the latter. The piece is 40 feet long and 4 inches wide, and is made from No. 20 steel wire. It is as pliable as leather, in fact more so, and will wrap around a 1 or 2-inch shaft without straining or bending the wire. The link arrangement is similar to that of the flat gold chains worn by gentlemen and ladies, and presents a handsome appearance. The sample shown has a tensile strength of five tons. As soon as the proper machinery can be manufactured for making this belting it will be put upon the market for sale.

**MANAGING LAMP WICKS.**—Sometimes the lamp wick absolutely refuses to be turned up in an orderly manner. It will seem firmly wedged on one side, while the other runs up in a point, causing weariness and vexation of spirit. To overcome this difficulty, take a new wick, draw out a single thread near the selvage, and the wick will be found quite tractable when introduced into the burner. The cogs will take it up properly, and it will appear in good form and give an even flame when lighted.

**THE PHOTOGRAPHER'S LENS** is more discerning than the naked eye. A recent photograph of a figure-painting by an American artist shows that a woman's gown was first painted a hue and texture very different from that finally chosen, the underlying brushwork appearing plainly in the photograph, though not seen by the most attentive observer of the original picture. In like manner photography reveals stars that to the human eye are not distinguishable from nebulous matter.

**TO CLEAN AND POLISH A PARLOR ORGAN OR PIANO,** wash it with a soft old silk handkerchief wrung out in lukewarm suds made with best Castile soap; then dry immediately and rub with chamois-skin. If the instrument is very much scratched and defaced, rub with good furniture polish and polish for a long time with dry chamois or a piece of soft silk.

**TO POLISH PLATE GLASS** and remove slight scratches, rub the surface gently, first with a clean pad of white cotton wool, and afterward with a pad covered over with cotton velvet which has been charged with fine rouge. The surface will, under this treatment, acquire a polish of great brilliancy, quite free from any scratches.

**A CURIOUS FEATURE** of the day is that while iron is dull and declining all the leading metals—as copper, tin, spelter, etc.—are excited and advancing in price. Of course speculation has much to do with the situation in metals, but even speculation must have some basis to rest upon.

**LEATHER CASTERS.**—Casters made of leather are said to be a new invention. Heavy furniture which must be moved often for sweeping soon wears bad places on floors or carpets, and a solid sole-leather caster must prove a blessing to housekeepers.

**TO POLISH RUBBER.**—Manufacturers of rubber articles get the fine polish on them, which is so generally seen, by using fine pumice and a stiff brush, finishing off with whiting and a soft brush. Rotten-stone and oil are sometimes used.

## GOOD HEALTH.

## A Few Facts About Tobacco.

We deem it our duty to point out to those contemplating marriage the curse entailed through using tobacco. We have heard many assert that the laws of heredity were "all moonshine," yet we only testify of "that we do know."

Years ago, a young man well known to us, married. Children were born until they had seven sons, but none of these boys lived to be over three years of age—usually, not over one—all dying with what the physicians termed "brain trouble." When the fifth child died, several medical gentlemen held an autopsy, deciding: Brain trouble resulting through heredity. Cause, excessive use of tobacco by the father. We were present when the last one died, and we shall never forget the mother's agony as she cried out, "Oh, my God! must poor little Georgie go as the rest have done?" Who can imagine the feelings of those parents as they stood by the row of little graves—seven of them—only think of it? Could the luxury of a self-indulgence appease the sorrow of so great a bereavement?

We know of another family, whose father not only uses tobacco excessively, but intoxicates also; three of his sons cannot walk, hav-

ing to use wheeled-chairs as their only means of locomotion. The boys appeared to be all right until about the age of seven, when a slight paralysis commenced, increasing more rapidly at about 13, when all use of the lower limbs ceased. These cases have resulted—or have been pronounced to have resulted—through heredity; tobacco the chief cause.

Still another father whom we know, has, through excessive use of tobacco, entailed kleptomania upon his three sons. The father is an honest, esteemed citizen, descending from a goodly line of ancestors; the mother, a most estimable woman, but the sons will take tobacco wherever they can find it; and in case they do not come across it, take something which will hurt it.

In the face of these facts would it be wise for a young woman to marry a tobacco user? Is it reasonable for a young man to form a habit entailing such results? These are not isolated cases. We know of others where there were not so many cursed in one family, yet one victim, at least, was sacrificed on the altar of self-indulgence. Tobacco-using is not safe. Many a young man has his mental faculties clouded, the "bright boy" merging into a very commonplace man, just because of it. We have had young men confess to us that tobacco had destroyed, in a great measure, their will-power.—*Exchange*.

**TREATMENT OF MALARIA.**—Malaria is being successfully treated in the medical stations of the Punjab with picrate of ammonia. The usual dose is from one-eighth of a grain to one and a half grains four or five times a day in a pill. Half a grain is a fair average dose. Thus given the result is soon visible. In the great majority of the cases treated one-half grain doses in the interval prevented the recurrence of the next attack of the fever, while in about 20 per cent of the patients two or three attacks followed before the fever ceased. In only one case of quartan ague, despite large doses of the salt, the fever recurred for six periods, gradually diminishing in intensity and then yielding to it. It is equally successful in all the forms of ague, but it is a curious fact that the cases in which it failed to cure were all of the tertian variety.

**SMALLPOX PROPHYLACTIC.**—One of the best preventives against smallpox is cream of tartar. Dissolve two teaspoonfuls in a glass of water and drink half of it before breakfast and half before the last meal. An agreeable beverage may be made by taking a half-ounce of cream of tartar, a lemon sliced, and half a pound of sugar. Add three pints of water, let it stand for half an hour and strain. This drink may be taken with advantage as a preventive. Among the Chinese, cream of tartar is believed to be a positive preventive of smallpox. Our physicians are now furnished with the best of vaccine, and there should be no delay in taking this first precautionary measure. A reasonable degree of care in keeping the system in good condition should be observed at all times, but especially when in fear of this dread disease.

**DIPHTHERIA FROM ANIMALS.**—A few weeks ago the *Martinez Gazette* mentioned the death of a horse which had all the symptoms of diphtheria. This account met the eye of W. M. Eddy of Santa Barbara, and he has written to the above-named paper as follows: "I am confident that horses and other animals can and do have diphtheria, and that cases of the disease among children that are generally considered sporadic are simply instances where it has been taken from animals. I am confident that two cases of diphtheria in my family were contracted from a horse and a dog respectively, and my opinion is concurred in by our family physician. Warn your people that the dreadful disease is as likely to be contracted from horses as from human beings."

**WORMS IN EGGS—DON'T EAT THEM RAW.**—Professor Liehe adduces reliable data in answer to the question whether living worms are to be found in hen's eggs. A short time previously his sister had found a round, threadlike worm, the length of a little finger, in the white of an egg. It moved itself in a very lively manner. She at once took the white of the egg to a druggist, who put the worm in alcohol. Professor Mohius of Kiel decided that the specimen was an example of the thread-worm of fowls—*Heterakis inflexa*—often found in the small intestine of the domestic hen. Only a few instances of the existence of the same in the white of the egg have been recorded.

**A GERMAN LUXURY.**—A powder of pine needles is now prepared in Germany, and is becoming popular for use in baths. A half pound or a pound of the powder is allowed to digest in lukewarm water for a few minutes, when the bath is ready. The principles extracted act upon the skin as a tonic and antiseptic, and the baths are prescribed for rheumatic complaints, gout, certain skin diseases, and for invigorating the system generally. The powder is also used for fumigation in chest affections, etc., or as an antiseptic a little may be placed on a hot cloth and carried about the room.

**THE VOMITING CENTER.**—Prof. Tumas, a European physiologist, has shown that vomiting is the result of irritation of a space in the medulla oblongata about one-fifth of an inch long and one-twelfth wide, and believes that the brains of ruminants, rodents and other non-vomiting animals lack this "vomiting center."

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Butte.

**QUARTZ MINES.**—Gridley Herald, Dec. 29: From a reliable source we learn that a general revival of operations is dawning in the quartz district tributary to Brown's Valley. The Jefferson and Danbrogue ledges, from which nearly \$1,000,000 has been taken out, will be reopened this spring, as will also the Dunderberg. The latter property is owned by Messrs. Burroughs & Hibbert, who are now refitting the mine with new machinery throughout. Mining experts consider the outlook for the district as very flattering.

## Calaveras.

**MURPHYS.**—Cor. County Record, Dec. 29: In my last letter I made mention of mining property belonging to Morse and Stone on the outskirts of town. Since then I have gleaned the fuller details concerning these mines, four in number, Hidden Treasure, Piety Hill, Poverty Hill, and the Matteson Extension, and the recent assays and the working of a ton of quartz at the Selby smelting works at Valjejo. These mines give promise of great fertility in their precious metal-producing qualities, and sooner or later will attract the attention of mining men. The late assays and working tests place these mines among the foremost for average richness of quartz. The 2000 pounds worked at the Selby works yielded the handsome sum of \$707 in gold and silver clear of all expenses. Assays have reached a much higher figure than these, and when it is understood that quartz is worked up to a fraction of the assay at the Selby works, the best results can be expected from these mines. As high as 25 per cent in silver is obtained in assays.

## Fresno.

**THE MUSICK.**—Fresno Republican, Dec. 24: W. B. Tucker, superintendent of the Musick gold mine, which is situated on Dinkey creek between the Kings and San Joaquin rivers, was in this city yesterday, bringing with him several specimens of ore for the inspection of Messrs. Ingalls, Church and Beall of this city, the owners of the property. The specimens were taken from the 250-foot level, and it is thought will assay something over \$100 to the ton. A large force of men is at work sinking new shafts and driving new tunnels, and by spring they will have an immense amount of rock waiting for the stamp-mill to be built as soon as the snow melts. The owners have so much confidence in the future of the mine that it is not for sale.

## Plumas.

**PROSPECTING.**—Greenville Bulletin, Dec. 30: During the past six years, T. K. Chapin and J. J. Fisher have been prospecting some quartz veins on the ridge running north of the Southern Eureka, which were worked, they inform us, over 20 years ago, then being known as the White Ledge and the Yellow Jacket. They have run over 600 feet of tunnel and drifts and sunk over 150 feet of shafts, mostly on the west side of the ridge, where they have found very rich float at different times. They have lately been running a new tunnel from the north end of the ridge, which will strike the old Yellow Jacket Ledge, under the old works, at a depth of about 80 feet, and the White Ledge 150 or 160 feet deep. They have also a claim called the Monumental, north of North Canyon, on which they have sunk a shaft on the ledge. They have also run a tunnel striking the vein at a depth of 40 feet. From this tunnel they have sunk 24 feet on the ledge, and run various drifts and cuts. All of this work has been done on what appears to be the south end of the chimney, as the rock to the north prospects well, while to the south but little gold is found. On this claim they have started a new tunnel to strike the ledge 75 feet further north than the old works, and at a depth of from 60 to 70 feet from the surface.

**NORTH FORK ITEMS.**—A. N. Cameron is over from North Fork. He will resume work in the tunnel on his claim after the holidays. John Ellis has sold his interest in the Malvern Hill claim to Chas. Lee, and has gone to Chico. The Glazier mine is reported to be paying well now. F. Sorsoli has purchased an interest in the B. Piazzouia claim, and work is being prosecuted. Benham is pushing work on his mine at Malvern Hill.

## Nevada.

**NEW MILL.**—Foothill Tidings, Dec. 30: The new mill at the Champion mine, Nevada mining district, was started up Wednesday and everything was well. After New Year's Day will be kept going constantly. Mine yielding good quality ore. Force of men employed is small but will be increased.

**EVENING STAR MINE.**—Grass Valley Union, Dec. 31: The directors of this mining company, who have been in town the greater part of the week, examining the property, have determined to proceed with the building of hoisting works and mill with as little delay as possible, and keep up the work of development on the mine, which has given encouraging results from the work already done upon it. Unfavorable weather may retard the proposed improvements somewhat at this season of the year, but advantage will be taken of all the good weather that offers. The Evening Star location is on the south side of Squirrel creek, near Deadman's Flat, and about three-fourths of a mile southwest from the North Star mine. The company is a strong one, and the owners are very favorably impressed with the value of the quartz mining resources of the district, and believe that it offers better inducements for investment than any other mining section of the State.

**A RICH STRIKE.**—North San Juan Times, Dec. 30: Some months ago Frank H. Bell, J. G. Hall, Joe Hustler and A. S. Bigelow located a quartz ledge at or near the Badger Hill diggings, in the upper part of this township, which give promise of being another Delhi. The company have been quietly at work on their claim prospecting it, and they have driven a tunnel into and along the ledge for about 65 feet. While running this tunnel a chute of rock of great richness was struck wherein free gold is discernible in large quantities. The ledge is three feet in width 80 feet below the surface and all of it will pay for milling. This strike has created quite a sensation in and around Cherokee

and now prospecting for paying ledges is all the go. The owners have christened the mine the Success.

**THE EL DORADO.**—A company of Nevada gentlemen, among whom are George C. Gaylord, Dr. H. S. Welch and Wallace J. Williams, have for some time past been prospecting for quartz in the vicinity of the General Grant mine. A letter from one of these gentlemen informs us that a rumor is afloat that in the course of operations the El Dorado Company had developed in their prospect tunnel a two-foot ledge of fine appearance. This ledge is not the one the company is looking for, but is welcome all the same if there is anything in it.

**EVENING STAR MINE.**—Grass Valley Union, Dec. 31: The directors of this mining company, who have been in town the greater part of this week, examining the property, have determined to proceed with the building of hoisting works and mill with as little delay as possible, and keep up the work of development on the mine, which has given encouraging results from the work already done upon it. Unfavorable weather may retard the proposed improvements at this season of the year, but advantage will be taken of all the good weather that offers. The Evening Star location is on the south side of Squirrel creek, near Deadman's flat, and about three-fourths of a mile southwest from the North Star mine. The company is a strong one and the owners are very favorably impressed with the value of the quartz mining resources of the district, and believe that it offers better inducements for investment than any other mining section of the State.

## Shasta.

**WINTHROP.**—Shasta Democrat, Dec. 29: The old Winthrop mine, at Copper City, started up again last week and is running a day and night shift. The prospects are very flattering, a rich body of ore having been struck recently. The owners, Jones, Spruance & Stanley, it is hoped, will soon reap a rich reward for their pluck and perseverance. Mr. C. E. DeForest has just returned from Squaw creek, where he has been for the last two weeks working ore in that section as an experimental test. Two tons of ore from the Carson mine, which was left over, were worked in the Cressius mill and yielded \$29 per ton. Ten tons were then worked from the Clipper mine, which yielded \$425, or \$42.50 per ton. Mr. DeForest reports the ledge on the Cressius mine widening and the Clipper as looking well.

## Sierra.

**CHANGE OF MANAGEMENT.**—Foothill Tidings, Dec. 24: New York parties own the Pilgrim mine of Sierra county, situated about eight miles above Forest City. Although the Pilgrim has a good ledge and all facilities for operating, including a 20-stamp mill, the mine has not paid, and recently a change of management was determined upon. Major Fitzgerald, book-keeper at the Brunswick mine of this place, has been appointed superintendent of the Pilgrim and B. A. Penhall is to be foreman. The first-named gentleman is not widely known in this district as a mining man, but his associates vouch for his capability to fulfill the duties incumbent upon the superintendence of a mine. Mr. Penhall is universally known as a practical miner of long experience and a good man in all respects. In his departure Grass Valley will lose one of its most indefatigable prospectors.

**GRAND PRIZE.**—Mountain Messenger, Dec. 29: The Grand Prize Co. are running a tunnel for their gravel lead, that is in quite a distance. They have one of the most promising drift mines in Northern Sierra.

## Trinity.

**A GOOD CLEANUP.**—Journal, Dec. 31: The recent cleanup at the Enterprise mine, East Fork, proved satisfactory to the owners. Out of about 18 tons of ore they realized a little over \$1800. This mine is gradually being developed and is proving fine property. The arastra will be run only a few weeks more, as the company desires to do a good deal of work running tunnels and prospecting the mine in order to determine as early as possible if it will be advisable to erect a mill. If sufficient quartz is discovered to justify them, the company will put up a stamp-mill early in the coming summer.

**FAVORABLE OUTLOOK.**—Supervisor Carter and Mr. C. C. Shattuck, from Hay Fork, speak very highly of the quartz outlook in that place for the coming year. Mr. Shattuck is taking ore from the Magdalena, which he is piling on the dump; he is crushing rock from the Cyclone, in which mine he has a four-foot ledge of fine ore. Mr. Shattuck will soon crush ore from the Good-enough, owned by Searles & Co.; as he has the only mill in the camp, he is compelled to do some custom work as an accommodation.

**SPECIMEN.**—Mr. T. J. Blakemore this week presented us with a fine, large specimen from the Daisy mine, owned by him and Clarence Hughes. It was taken from the ledge at a depth of 35 feet, shows free gold and is quite rich in sulphures. The ledge is about 14 inches and every indication points to a good and permanent ledge. The owners have an arastra ready to crush the ore they have been and are taking out.

**TWO GOOD STRIKES.**—While doing assessment work on the Poor Man mine, owned by Smith, Moor & Co., in the East Fork district, a 30-inch ledge of good-looking quartz was found; the ore will go about \$40 to the ton. Day & Moor in the Yellow Pine, which is situated on the top of the mountain above the Coleman property in the East Fork district, have struck a vein of very good ore which prospects about \$50 to the ton; the rock carries free gold and sulphures.

## Tuolumne.

**KINCAID FLAT MINE.**—Union Democrat, Dec. 29: The contract for continuing the tunnel and opening ditches of the Kincaid Flat Mining Co. was completed Wednesday. P. J. C. Reylend, the contractor, went to San Francisco Thursday, and upon his return it is expected that under his supervision mining operations will commence. The claim is now in condition to be properly worked, which it never was before. From the nature of the ground and from what it yielded in other days, there is every reason to expect it will prove profitable to the present owners. At all events, they merit success, as they have taken chances by expending quite a sum of money to demonstrate its value.

**BALD MOUNTAIN.**—The claim owned by Messrs. Mandich and Bankulich on Bald Mountain bids fair to develop into an immense bonanza. About 400

feet from the mouth of the tunnel this week a crossing was struck which prospects immensely in coarse gold, and as there are many seams running obliquely into it ahead, big things can be looked for. This is one of the finest properties in the county, and great energy combined with judgment has brought the mine deservedly to the front. The ground has to be blasted every inch, and much credit is due the gentlemen.

**BONDED.**—The mine at Cherokee owned by Messrs. John and Michael Shine, has recently been bonded to Messrs. Hamilton, Corbin & Co., who have a force of men at work sinking a winze and doing other preparatory work. The quartz recently taken out shows gold quite freely, and a new chute of large proportions has been developed. After the mine is thoroughly opened a mill will be erected in the spring. The welcome rain commenced falling Monday morning, and swelled a storm on Tuesday night. This being a mining county, water is an absolute necessity for its prosperity.

**PURCHASED.**—The other half of the Mandich mine has been purchased by Messrs. Bankulich and Mendich Bros. It is on Bald mountain below the Morris mine, and the present parties are now the sole owners. At present writing the boys have a tunnel in 400 feet; have discovered many gold-bearing crossings, and have great chances of big results—since the crossing now under operation is bearing down on the lead and throwing a heavy prospect of coarse gold, and at a distance from the mouth of the tunnel of about 400 feet. The chances for this claim throwing a hundred thousand dollars are very encouraging. The same company owns three other mines on Bald mountain all of which are good properties.

**THE JOHN ROYAL.**—Michael M. Shine of Pine Log, in partnership with R. M. Lane, is working the old John Royal lode, which years ago yielded some \$30,000. It appears that the chute making the deposits pitched oppositely from the shaft, and now the above gentlemen have drifted south, and for the first time since its early history, the conditions attending the bonanzas have appeared.

**SHIPMENTS.**—A mining company near Sonora recently shipped nine tons of sulphurets for which \$100 per ton was paid by the proprietor of a reduction works.

**HOISTING WORKS.**—The hoisting works for the Gilson & Platt mine, at Soulsbyville, are about completed and have a capacity to hoist a thousand feet.

**PROSPECTING.**—The Ice-House Hill mine, above Yankee hill, owned by Mr. L. Peterson, is prospecting well for a huge pocket.

**THE GARRETT MINE** on Bald mountain will soon have its customary force of men at work.

**TO BE WORKED.**—Tuolumne Independent, Dec. 30: Col. Caleb Dorsey of San Joaquin valley is arranging to work his mines above Columbia. That section of the county has some splendid quartz mines, but there are no means of reduction. As an evidence that capital is going that way, may be cited the mining plants of Goodwin & Co. of San Francisco; also, Thos. Matteson & Co. The Hyde mine, above Sonora, is doing well in its returns of free gold, and better in its concentrations. Several tons were lately shipped to the Selby works, and after defraying expenses of freight and reduction, a fair profit remained. This mine has a large percentage of sulphurets of various kinds, and the results thus far amply justify the erection of chlorination works. In fact a number of shipments of sulphurets have lately been made from mines in this county, and, so far as known, the results have been fully up to expectation.

**LEASED.**—R. M. Ashlock has leased some ground from Mr. Reeder, south of the Roller property, and commenced mining. A lead runs through the ground, and considerable gold has been found above the gulch and near the lead.

**TO START.**—At the Hunter mine preparations are being made to start the mill, which is now being fixed up. It will probably be all ready by the time water can be procured. The new hoisting works are on the ground, and everything necessary to put the mine in good working order. The shaft is down 40 or 50 feet, and the mine is believed to be a good one.

## NEVADA.

## Washoe District.

**HALE & NORCROSS.**—The 400 level west drift: is in fair-looking ore. The upraise on the 700 level to connect with the south drift from slope 45 feet above, the farthest boundaries of which 160 feet farther north, has reached the proper height for the connection, and drifting north has commenced from it. The connection will be made in a few days. This will give them a good circulation of air at that point. This upraise exposes a continuous body of high-grade ore as far as extended, 160 feet in length. The upraise on the south from the 700 level is 45 feet in ore, and the slope 160 feet north of that point is 49 feet in ore above the top of the southern upraise, in a ledge which cannot be less than 50 feet wide at that point.

**SAVAGE.**—On the 600 level work in the south main drift, which is making toward the ore development in the Hale and Norcross, and which it is expected to tap, is making good progress. It is now within 30 feet of the north boundary line of the Hale and Norcross. Are now extracting the usual quantity of ore from the several levels between the 400 and 900 levels. Have hoisted 707 tons of ore and have shipped 692 tons to the Mexican mill.

**CON. CAL. AND VIRGINIA.**—Ore of good quality is being stoned on the 1400 level, and on the 1435 that which is of a high grade is being obtained. There are improvements at several points in the mine. On the 1300 level the ore in the stopes is said to be widening to the northward.

**BEST AND BELCHER.**—On the 1300 level the east crosscut near the north line has been extended 36 feet; total length, 282 feet. The formation is porphyry, showing some water. A connection has been made with the upraise from the 1300 level. This connection reopens the mine where they were working prior to the fire of June 24th.

**GOULD AND CURRY.**—On the 425 level from the top of the upraise in the east crosscut an east drift has been advanced 28 feet. This drift is in clay and quartz showing value by assay.

**BELCHER.**—West crosscut No. 2 on the 400 level

is now in 29 feet. The face is in the same character of ore as last week. Work in the south drift has been resumed and advanced 20 feet. The face is nearly all in quartz, showing spots of ore, and looking very favorable.

**BALTIMORE.**—The pumps are working well and are fast reducing the water that flowed into the main shaft when the west crosscut on the 300 level cut in to the west vein. Two or three bodies of good ore have been cut.

**ANDES.**—The west drift from the north drift on the 240 level is making good progress, but as yet is in vein porphyry. On the 350 level the west drift has passed into quartz which is showing some ore.

**OCCIDENTAL.**—Are prospecting at several points of interest in the upper tunnel, and have extracted a few tons of fair-milling ore. Have extracted 100 tons of fair quality of ore from the 100 level.

**YELLOW JACKET.**—An average of 300 tons a day is being shipped to the mills on the Carson river. This ore is being taken out at points between the 1100 and 1400 levels.

**HAYWOOD.**—Some fine ore was recently struck in the drift from the bottom of the winze 200 feet below the tunnel level, making it 300 feet from the surface.

**SEGREGATED BELCHER.**—A south drift has been started from the top of 1300-level upraise, and is now in 10 feet, and is in the same material as last week.

**MEXICAN.**—The west crosscut from the north drift on the 1300 level continues in soft material much mixed with clay in the form of slips.

**CROWN POINT.**—The 500-level crosscut has been advanced 32 feet since last report. The face is in the same favorable formation as last week.

**UNION CON.**—West crosscut No. 1 on the 1300 level still continues in a formation in which porphyry is the predominant rock.

**UTAH.**—All work during the week has been confined to repairing the north drift. The east crosscut will be started at once.

**JUSTICE.**—Have about 1250 tons of fair-grade ore on the dump, which comes from the north and south drifts on the 600 level.

**ALTA.**—Are extracting ore from the 725, 825 and 1150 levels. The mill is crushing 24 tons a day.

**OPHIR.**—Good ore is being extracted from the winze down from the 1300 level.

## Bernice District.

**ORE DISCOVERY.**—Cor. Silver State, Jan. 3: Bernice had one of her best Christmas presents she has ever had presented to her in the way of the recent developments in the lowest levels of the Golden Crown and Silver Ridge mines. The former, after a heavy expenditure in running a tunnel 850 feet, with an upraise of 200 feet to make connections for the sake of ventilation and working facilities. The recent ore discovery, or rather a continuation of the ore chutes from the upper levels, now changing from a chloride to a high-grade sulphure ore, gives every evidence, as far as opened, of yielding a handsome return to its fortunate owner. The Silver Ridge mine has also been running a tunnel to open a new level and make drainage. The winzes sank on the vein from the present level encountered not only high-grade ore but a steady flow of water, making it necessary to immediately run a lower tunnel, which has now reached the vein, giving 100 feet of backs of fine ore on the ledge. Bernice for some considerable time past has been playing a rather conservative policy in doing her deadwork while silver was heavily depressed, in the hopeful anticipation that the day was not far distant when silver, that much-abused metal, will take her former relation to gold.

## Central District.

**CHLORIDERS.**—Silver State, Dec. 31: S. W. Hammond says chloriders are doing well, and there is more life in the camp than there has been for years past. Charley Wright & Co. are shipping ore from the Keystone; A. H. Ruse is extracting very rich ore from the Millionaire, and Frank Clark has leased a part of his mine, and is hauling ore to his mill so as to be ready to crush when the river rises. Norman Gilhart has been getting out rich ore from the Locomotive, and is shipping it to the Selby Smelting Works in California.

## Garfield District.

**LIVELY.**—Cor. Virginia Enterprise, Dec. 30: Garfield is the liveliest camp on the coast. Every man who comes here and wants work can get it. None are turned away. The Minnesota Copper Mining Company have begun active operations on their mine. Wesley Ballinger is prospecting the Black Prince, an extension of the Hindley. The mineral, though scarce as yet, is of very high grade. Work on the new addition to the Garfield mill is rapidly nearing completion. Superintendent G. C. Fisk of the Ida is expected here in a few days, when a large force of men will be put to work to develop the mine. The Ida is owned by Dayton people and is an extension of the famous Western. It is one of the richest mines in the district. Lew Stoner, the old-time Carson river millwright, has taken a contract to build an ore dump at the Western mine for the Garfield Company.

## Jefferson District.

**MILL RUNNING.**—Belmont Courier, Dec. 29: Charles Kanrohat's mill is running on ore from the Union mine, and it is expected that fine bullion will be produced shortly. Mr. Kanrohat owns some good mining properties in Jefferson district. Work on the Harrison mine at Jefferson is pushed with energy. The Harrison Brothers are encountering some good ore which will be worked in their mill as soon as the weather permits.

## Pamlico District.

**FREE GOLD.**—Cor. Virginia Enterprise, Dec. 30: Jason Lothrop and Billy Mattison of Dayton came in from Pamlico District, where they have been prospecting. They brought in some very fine specimens of free gold, and claim to have made a very rich strike.

## Island Mountain District.

**GOLD PLACERS.**—Cor. Reno Gazette, Dec. 29: Island Mountain Mining District was discovered and organized in 1873, and is about 70 miles north of Elko. At the time of its discovery a large number of gold placer claims were located upon Hope Gulch, which upon being worked next spring proved to be

rich but not very extensive. The water supply is small, coming principally from the snowbanks in the neighboring hills, and is generally exhausted by the first or middle of June, giving at best eight or ten weeks' mining season. For the purpose of getting greater supply of water and for a longer period of each year, a ditch was constructed in 1874 which afforded water for all the claims below, including French & Co., from early spring to the 1st of August of each year. Above the elevation of the ditch and above where the water could not be conveyed, mining was carried on in small sluices and the cradle. The Owyhee Company, E. Penrod & Son and J. L. French & Co., carried on for several years extensive operations with satisfactory results. Placer mining has continued from its discovery up to the present time, but most of the claims were worked out years ago, except those worked by J. L. French & Co. and E. Penrod & Son. Their claims will afford several years' run before they are entirely exhausted. It is claimed by those well posted that the amount of gold extracted from these mines to the present time will not fall short of \$280,000. This result may seem small, but it must be remembered that the district is situated about 7000 feet above the level of the sea, and that the working season is short. The most prominent location of quartz that is attracting local attention was made over a year ago by Messrs. French and Penrod Jr. The latter gentleman's thereafter sold out his interest to Messrs. Rogers and Brooks of Elko. The company thus organized proceeded to develop their mine under charge of Mr. French, the principal owner. They have sunk the shaft some 30 feet deep. This mine is situated north of Hope Gulch about a quarter of a mile.

#### Railroad District.

**THE MINES.**—Cor. *Reno Gazette*, Dec. 20: Railroad mining district is 25 miles south of Elko, and was discovered and organized in the year 1869 and since that period to the present it has been worked each year more or less with varied success. The chief and most important mines are found on the northwest face of Bunker Hill (whose peak reaches 9500 feet above the level of the sea). At one time a New York company had control of several of the most valuable ledges known at that time and performed a large amount of prospecting work, built a first-class smelting furnace, took out several thousand tons of ore from which they realized a handsome yield of bullion, and all seemed to be success when all at once orders came to stop work and close down. Recently this property passed into the hands of Edward Reilly. Mr. Reilly has made several runs during the past three years, which have been highly satisfactory, from ore taken from the system of ledges belonging to this property. Mr. Reilly worked his mines through a tunnel driven from the bottom of the hill from which other tunnels are excavated, reaching and opening out the series of ledges. Besides this property there are a large number of other valuable locations, and among them is the Sweepstakes, which is worked and owned by Charles A. Brosamer, who has opened up a fine piece of mining property. The ore taken from the mine is heavily charged with copper and silver, while the ores extracted from the mines belonging to Mr. Reilly are chiefly galena. In fact all the ores of this district are known as smelting ores and are easily worked, coke being used for smelting in lieu of charcoal, heretofore used. The coke is shipped from Elko. But the most noted and productive piece of mining property is known as the Tripoli, about half-way down Bunker Hill on a ridge or spur that makes down from the main mountain. This mine has been worked at times since 1870, but without much success, as the mining operations were badly directed, from the fact that the pay ore was found to exist in chambers or pockets with strata a few inches wide, widely dispersed throughout the deposit of quartz rock. However, in course of time better judgment prevailed, the mine having passed into the hands of J. Henderson of Elko, and a tunnel was excavated a few hundred feet below the discovery point from the east side which reached and penetrated the mass of quartz at the depth of 350 feet from the surface. At this point the deposit begins to assume more of a vein-like form and explorations have been continued by which several hundred tons or more have been taken out and worked by smelting process during the year 1886, yielding some \$90,000 over and above the gross expenses of mining operations. There is now on the dump a large quantity of first-class ore that it is believed will work not less than \$100 per ton on the average. This ore was taken out during the past summer, during which time there was also a large amount of dead-work in making connections and replacing timbers and generally putting the mine in first-class trim with a view of mining and working a large amount of ore during the year 1888.

#### Reveille District.

**TAILINGS.**—Belmont *Courier*, Dec. 29: The mill at Reveille is still running on tailings, and regular bullion shipments are made by William R. Norris.

#### San Antonio District.

**SILVER ORE.**—Belmont *Courier*, Dec. 29: Superintendent Asa B. Eastwood recently shipped to Eureka a load of silver ore from one of his mines in San Antonio district, Nye county. This ore was worked in the Eureka Con. furnaces, and the result proves very satisfactory. Mr. Eastwood is now at San Antonio. He expects to ship a larger load of the same class of ore shortly. The mines in the district are looking uptop, and the work of development will be pushed with vigor.

#### Spanish Belt District.

**LOOKING WELL.**—Belmont *Courier*, Dec. 29: J. E. Severance informs us that the Barcelona mine is looking splendid and that the work of development is pushed vigorously.

#### Tybo District.

**PROGRESSING.**—Belmont *Courier*, Dec. 29: Operations in the Ma Alta mine are progressing satisfactorily and good ore is encountered daily.

#### Tuscarora District.

**NAVAJO QUEEN.**—*Times Review*, Dec. 30: Are making good progress sinking shaft.

**ARGENTA.**—Sinking has been delayed some by the severe storms. A house has been erected and the shaft sunk nine feet during the past week.

**PONDERE.**—Last Monday started a south drift from shaft No. 2. The vein is small, but looks very

encouraging; occasionally a piece of ore shows free gold. North drift from main incline is looking well; the vein is well defined with good walls, and the pay streak is yielding good ore.

**NEVADA QUEEN.**—South drift, 100-foot level, has been advanced 13 feet in hard blasting rock. North drift has been extended 11 feet. Have started sinking in the winze from 200-foot level to connect with No. 3 crosscut on 350-foot level. No. 3 crosscut, 350-foot level, has been driven 20 feet, passing through several seams of spar and clay.

**NORTH BELLE ISLE.**—North drift from No. 3 crosscut north, 300-foot level, has been extended 12 feet. North drift from east crosscut No. 2 north, same level, has been extended 13 feet.

**FOUND TREASURE.**—The crosscut, 200-foot level, has been run 20 feet during the week. The rock is breaking better, and the formation is favorable for ore.

**NAVAJO.** South drift, west vein, 350-foot level, extended 8 feet. Rock breaks very hard. South drift from east crosscut No. 4, same level, has been extended ten feet.

**YOUNG AMERICA SOUTH.**—Drift north from crosscut, west ledge, has been advanced 12 feet. Good assays have been obtained, but ledge small.

**COMMONWEALTH.**—Have started drift north on the 100-foot level to follow the vein, it being three feet thick in the face.

**GRAND PRIZE.**—Stopes are looking and yielding well.

### ARIZONA.

**IN THE CATALINAS.**—Arizona *Star*, Dec. 31: Work on the Mammoth is progressing well. As soon as the panning and settler arrives the mill will start up for testing purposes, for determining character of the ore developed during the course of exploration. Permanent work has commenced on the American Flag made under the management of Thos. Armstrong. The property has been lying idle for the past two years. A fine body of ore was struck on the surface when opening the air shaft last week. The ore is silver-bearing. The main workings are down 180 feet. There are levels at 75 and 150 feet. There are seven mines in this group. Mr. Ezekiel has just completed a contract in doing the assessment work on the Oracle group. Some good gold ore was struck on the Hondoo mine, and the other claims look well. Both of these groups are the property of the Richardson Con. M. Co. of New York. They have been recently bonded to an English syndicate.

**COPPER.**—Copper mines will now be in demand. Globe District can show more good copper mines and prospects than any other district in the Southwest, and the fact should be brought to the attention of mining men and capitalists in the East.

**ACTIVITY.**—Like Hinzman returned to Globe a few days ago, after an absence of several months, during which time he visited the principal towns in Southern Arizona. He reports greater activity in mining at Tombstone and Bisbee than those camps have experienced at any time in the past several years.

### COLORADO.

**SEVEN-THIRTY.**—Georgetown *Courier*, Dec. 29: The great mineral-bearing veins included under the name of the Seven-Thirty are located on Brown and Sherman mountains, and are covered by over 40 U. S. patents, embracing a surface area of nearly 200 acres, and giving a total length along the veins of over 11 miles. The veins are from three to six feet in width, encased with walls of granite, gneiss and pegmatite. Numerous veins of porphyry and traceable extend across the country sometimes at nearly right angles with the mineral-bearing veins. In every instance these dykes have been found to be bisected by the mineral veins, showing them to be of prior origin. Porphyry also exists in the mineral veins, but without noticeable regularity. In some of the veins this rock, through kaolinization, seems to have absorbed sulphide of silver, and frequently carries from two to three per cent of that metal. Before any records of the ore returns from these veins were kept, the production was very large, and now that the workings have reached in places a depth of 1000 feet, ore is continuously extracted worth \$500 to \$1000 a ton. A fathom of ground over the tunnel level was pointed out to the writer which had produced \$500, the total cost of extraction being \$50. Five thousand dollars was taken out of a stope 100 feet by an old-time miner still in this camp. A stope 50 feet long produced at the rate of \$1000 per foot of \$50,000 for 5000 feet. An adjoining block of ground of equal size and richness is held in reserve for a rainy day. The present owner has the record of three-quarters of a million filed away in mill certificates of ore sold, and the entire production is estimated to be over a million dollars. On the 80-foot level may be seen a continuous stope on ore 1500 feet in length. The level produced \$100,000 in one year and is still producing large quantities of ore from the ends. The two levels below this again show almost continuous stoping for 1300 and 1400 feet in length, and are being driven on ore both ways. A block of this ground 300 feet in length is also held in reserve.

**BULLION.**—Georgetown *Courier*, Dec. 29: During the past year the Boston & Colorado Smelting Company made the following shipments: Gold, \$748,980; silver, \$2,634,305; copper, \$384,400; total, \$3,767,685.

### DAKOTA.

**FLOAT.**—Black Hills *Pioneer*, Dec. 29: James Brodie, who is working on the property of the El Dorado Company, reports the mine looking well. From Oscar Waller, in from Carbonate last night, it is learned that the force working on the Midsummer claim is constantly encountering pockets of chloride ore that assays over 200 ounces silver per ton. Confidence is expressed that these lead to a solid formation which will be discovered before the lapse of any great period of time. A Rapid City party is recently in receipt of a letter from Hon. M. H. Day, now in New York, stating that he is about organizing a company to take hold of his Spruce gulch property and proceed with its development. The locations are generally regarded here as among the most promising in the district, and

should a strong syndicate make the purchase the result will in all probability be the speedy adding of another name to the list of productive Black Hills mines.

### IDAHO.

**ERA NEWS.**—*Inter-Idaho*, Dec. 30: Frank Boyle, from Era, says that notwithstanding the shut-down of the Bannock company, Era is lively and prosperous. The approaching sale of the Horn silver mine will probably result in a greater advantage to the camp. Every one expects operations to be resumed in the spring. Other properties are being steadily developed. The St. Louis is showing up fine. All the Lava creek mines are being worked. The Hub is raising now and preparing to put up hoisting works in the spring. Some very rich ore has been struck lately, both in the upraise and in the face of the drift. The Hub continues its shipments to Nicholia, the last being some four or five tons. The value of the ore is shown by the fact that it pays to ship it so far overland by wagons. The charges on it are \$20 a ton to the freighters and \$15 a ton working charges.

**THE ELKHORN.**—Ketchum *Keystone*, Dec. 31: At a recent meeting in Helena, Montana, of all the owners in the Elkhorn mine of this place, a proposition was considered to spend a few thousand dollars in development work on that once lucrative property, and resulted in letting a contract to Hank Richardson and Griff Thomas, two well-known and experienced miners of this place, to extend the Keystone tunnel—now in about 600 feet—to a distance of at least 600 feet further, in a direction most practicable to intercept the Elkhorn ledge.

**NOONDAY MINE.**—John Ervin has secured a lease of the Noonday mine for 12 months. The Noonday was at one time a fine producer, and paid its owners handsome dividends, but for the last two or three years work has been entirely suspended.

**THE SILVER CROWN.**—The parties having a bond and lease on the Silver Crown mine, situated on the East Fork of Wood river, have uncovered an eight-inch vein of rich ore near the dividing line between it and the Venus mine.

**MINING NOTES.**—It is reported that the Minnie Moore and Queen of the Hills Mining Companies will resume operations again after January 1st, upon the basis of reduced freight rates, and miners' wages at \$3 per day.

### MONTANA.

**RICH PROPERTIES.**—Butte *Inter-Mountain*, Dec. 29: A gentleman from Anaconda says that new developments in the Blue-Eyed Nellie district continue to attract renewed attention to that section. The Homestake, which is some four or five hundred yards up the hill from the Nellie, is now shipping a good deal of high-grade ore, and the same is true of one or two claims situated in the gulch on the other side of the hill. The Homestake ore body was uncovered while the men were grading for building a cabin. The ore is similar to that in the Nellie, and there seems to be plenty of it. Other claims in the vicinity are showing up well.

### NEW MEXICO.

**IMPORTANT MINE SALE.**—Kingston *Shift*, Dec. 24: We learn that the Savage, joining the Superior and Bullion on the east, has been sold for \$50,000, and the Southwest, situated about two miles southwest of town, has been sold for \$25,000. John Fraser owns a half interest. The Savage has been a regular ore producer, while several shipments have been made from the Southwest, and the surface indications and workings are very favorable for the making a valuable mine, and we are inclined to think that the purchasers have made a good investment. John Fraser is an old-time here, who has stuck to the camp and is being rewarded. He has other valuable property here.

**SILVER WEDGE.**—Col. B. F. Pegues during his recent visit East organized a company to work the Silver Wedge, a mining claim lying on the north side of the Bonanza Hill, and adjoining the Caledonia and Comstock, both of which have a reputation known all over the mining world. Besides the Silver Wedge, Mr. Pegues has bonded from Col. Lockhart and R. H. Hopper the Carbonate mine, lying in the "Belt" immediately south of the Illinois and Brush Heap, well-known producing mines, and adjoining the Midnight and Hamburg, from both of which rich ore has been taken, but which, at present, are "tied up." The Carbonate has been in the same fix, and recently came into the possession of the above-named gentlemen. We understand that Col. P. has gone East to interest his friends in some of the property of which he has control.

### UTAH.

**REVIEW.**—Salt Lake *Tribune*, Dec. 23: The Ontario product for the week was, in bullion, 23,557 fine ounces; from ore sales, \$12,876.44, an approximate total of \$36,433.44. The output of the Daly for the week was \$11,458.53 fine ounces of silver bullion; no ore sales. Fine bar receipts in this city for the week were to the value of \$44,411.28; base bullion, \$10,700; gold bar, \$4000. The product of the Hanauer smelter for the week was \$19,500 in bullion; of the Germania, \$13,518.89. The Horn Silver is doing nothing as far as can be ascertained. Ore receipts in this city for the week were to the value of \$1700 by Wells, Fargo & Co.; \$9250 by McCormick & Co., and \$7441.03 by T. R. Jones & Co.

### WASHINGTON.

**COLVILLE MINES.**—Colville *Miner*, Dec. 29: The Mutual Smelting & Mining Co.'s works, just three-fourths of a mile east of Colville, was visited by a Miner representative last Monday morning, who found the smelter in full operation and melting out bullion. Rob Roy is still grinding away on the Daisy. He has met nothing to hinder his rapid progress in the tunnel and has been following good ore for three weeks. It is reported that the Eagle mine at Chewela has six men employed on the property, all working on ore, which they are piling on the dump, preparatory to shipment for reduction.

### Mining Share Market.

The following mining companies have cash on hand according to the statements placed on file yesterday:

Alta, \$13,080.41; Alpha, \$6414.08; Andes, \$9295; Bulwer, \$10,870.87; Bodis, \$40,606.99; Bullion, \$31,690.39; Belcher, \$18,352.52; Crocker, \$3701.07; Con. Cal. and Virginia, \$75,250.26 in cash and \$121,432.40 in unsold bullion, with more shipments to arrive; Challenge, \$15,170.88; Consolidated Imperial, \$9586.93; Dudley, \$1122.81; Exchequer, \$11,816.36; Eureka, \$61,914.30; Fraud Treasure, \$1935.77; Gould & Curry, \$29,166.92; Independence, \$5849.40; Julia, \$1452.23; Justice, \$10,151.19; Kentuck, \$946.37; Lady Washington, \$11,014.80; Mexican, \$4035.28; Mono, \$16,747.50; North Belle Isle is overdrawn \$1758.91, but has gross bullion valued at \$84,428.95 on hand, and bills receivable amounting to \$25,000; Ophir, \$17,147.07; Orleans, \$1297.79; Pondera, \$1098.04; Peerless, \$19,249.06; Peer, \$3658.92; Standard, \$89,950.20; Syndicate, \$10,776.39; Weldon, \$6242.16.

The following companies show an indebtedness: Best and Belcher, \$5798.59; Belle Isle, \$542.46; Commonwealth, \$33,561.43; Chollar, \$32,555.53; Crown Point, \$22,376.74; Hale and Norcross, \$20,842.76; Locomotive, \$6317.89; Mount Cory, \$46,594.90; Navajo, \$19,748.21; Nevada Queen, \$45,803; Occidental, \$3754.76; Potosi, \$41,005.09; Seg. Belcher, \$9707.35; Savage, \$17,350.55; Sierra Nevada, \$3063.66; Utah, \$1188.57.

Mining stocks do not seem to get much chance to advance any. There is a little spurt and then down they go again. On the Comstock the work of development of mines and extraction of ore is being pushed vigorously in every mine of promise along the lode, from its most northern to its most southern boundaries. So far as the interests of the workmen are concerned, this fact alone is sufficient to inspire a happy feeling. There was a time, and it is not long since, when mining managements were eager to seize upon any provocation, however slight, to make a draft in the mines and discharge men from work. Now, the conditions are entirely reversed. The elements and every contrary thing are battled against and almost invariably surmounted, and work is pushed forward over every obstacle.

### Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Hanauer, Dec 25, \$8450; Germania, 28, \$3927; Hanauer, 29, \$2430; Germania, 29, \$5814; Hanauer, 30, \$5000; Germania, 30, \$1908; Hanauer, 31, \$2530; Germania, 31, \$1806; Hanauer, Jan 1, \$8300; Germania, 1, \$1854; Nevada Queen, 1, \$20,000. The receipts of the metals in Salt Lake City for the week ending December 28th, inclusive, amounted in value to \$110,501.20, of which \$92,110.17 was in bullion, and \$18,391.03 was in ore. For the previous week the receipts were \$82,578.85 in bullion and \$27,103.13 in ore, a total of \$109,681.98.

**LANE LECTURES.**—The sixth course of popular lectures at Cooper Medical College, corner Sacramento and Webster streets in this city, will be delivered this winter, the first one occurring Jan. 6th. No ticket of admission is required. The program of lectures is as follows: Friday, Jan. 6, 1888, Professor L. C. Lane, "Coffee." Friday, Jan. 20, 1888, Professor Clinton Cushing, "Physiocal Excellence." Friday, Feb. 3, 1888, Professor A. Barkan, "Spectacles." Friday, Feb. 17, 1888, Professor J. H. Wythe, "The Microscope as a Detective." Friday, March 2, 1888, Professor Chas. H. Steele, "The Bath." Friday, March 16, 1888, Professor C. N. Ellinwood, "The Stomach." Friday, April 6, 1888, Professor J. M. Hirschfelder, "Electricity in Medicine." Friday, April 20, 1888, Doctor W. S. Whitwell, "Insanity." Friday, May 4, 1888, Professor Henry Gibbons, Jr., "The Utility of Pain." Friday, May 15, 1888, Professor W. D. Johnston, "Lower Forms of Life."

### Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOGAN—Santa Clara Co.  
M. S. PRIME—Alameda Co.  
G. W. INGRAM—Arizona.  
WILLIAM POOL—Fresno Co.  
W. W. WILKINSON—San Joaquin and Stanislaus Co.'s.  
A. F. JEWETT—Tulare Co.  
E. H. SCHAEFFLE—Nevada and Placer Co.'s.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
DR. STANLEY T. PRET, San Diego Co.

A CHRISTMAS dividend of \$6000 (10 cents a share) was distributed among the stockholders of the Bald Mountain Extension Company of Sierra county, most of whom are Downieville people. Thousands of dollars have been paid by this valuable property during the year.

## THE DOUBLE "ECONOMIC" STAMP MILL

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

## Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

## THE FRISBEE-LUCOP MILL, A CENTRIFUGAL ROLLER MILL

For Reducing Ores, Quartz, Phosphate and Cement Rock, and other  
Mineral Substances to any required degree of fineness  
most rapidly and economically.

All substances when ground leave the mill in a finished state—no regrinding being necessary. Automatic  
Feed. Wearing parts of Steel and Forged Iron.

### BLAST AND SCREEN MILLS.

Sizes.....	24 inch.	30 inch.
Weight.....	5500 lbs.	3800 lbs.
Speed.....	360 rev.	500 rev.
Horse Power required.....	15 to 18 H. P.	6 to 9 H. P.
Space required.....	6 1/2 x 4 x 4 feet.	6 x 3 1/2 x 4 feet.
Size driving pulleys.....	28" D. x 8" face.	20" D. x 7" face.

Capacity, 24-inch mill, 1 to 2 tons quartz per hour, to 60 mesh; 3 tons cement or phosphate rock per hour, to 50 mesh. Wearing parts require no fitting, easily and cheaply replaced when necessary. Cost of repairs differs with circumstances. Less than 1c per ton for phosphate and cement rock. Maximum, 10c. per ton for hardest quartz. For further particulars and prices address

## FRISBEE-LUCOP MILL COMP'Y,

HOOKER & LAWRENCE, General Agents,  
145 BROADWAY, NEW YORK.

And 461 Howard St., San Francisco, where a Mill can be seen in operation and ores  
will be reduced at reasonable rates.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

PARKE & LACY, General Agents, San Francisco, Cal.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by  
the great force and velocity of the steam currents the minerals are dashed against each other with such power of concus-  
sion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-  
heated steam currents employed, through which every minute particle of ore must pass, causes them to become very  
hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight  
and simplicity of construction of the Pulverizer, its extremely small and inexpensive wearing parts, are the WONDER  
and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

**PNEUMATIC PULVERIZER COMPANY,**

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING DECEMBER 27, 1887.

375,471.—CHAIR-BACK AND HEAD-REST—F. Binder, Alameda, Cal.

375,344.—SECURING SASHES IN WINDOW-FRAMES—S. R. Deacon, Los Angeles, Cal.

375,480.—CABLE RAILROAD CHANNEL—W. Dunham, Igo, Cal.

375,485.—GRAIN SEPARATOR—J. Grider, Stockton, Cal.

375,497.—APPARATUS FOR DISTILLING WOOD—G. Hunziker, Cloverdale, Cal.

375,496.—MUSIC CHART—C. S. Mason, Orange, Cal.

375,565.—TWO-WHEELED VEHICLE—N. S. Parker, Salem, Ogn.

375,509.—WAD-SORTER—P. Selby, Oakland, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY &amp; CO., in the shortest time possible (by mail or telegraphic office). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey &amp; Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

CHAIR-BACK AND HEAD-REST.—Frederick Binder, Alameda. No. 375,471. Dated Dec. 27, 1887. This novel chair-back and head-rest consists of a board of sufficient length, having devices at the lower end by which it may be adjustably connected with any chair, the upper end extending to a sufficient height, and having a cushioned pad or rest for the head.

CABLE-RAILWAY CHANNEL.—Warren Dunham, Igo, Shasta Co. No. 375,480. Dated Dec. 27, 1887. The invention is in the improvement of the channel or tube in which the cable of cable-railways travels. The invention consists of hinged flaps or lids covering the grip-slot of the channel-way and in their peculiar construction and arrangement. The objects of the invention are to exclude snow, dirt, and other debris from the channel. The flaps or lids are raised as the grip approaches, so as to permit it to pass as it is carried along by the cable, and they are let down after it has passed, so that they do not impede the general operation of the road.

WAD-SORTING MACHINE.—Prentiss Selby, Oakland. No. 375,509. Dated Dec. 27, 1887. The invention is a device for sorting wads which are used in loading cartridges, in order that the varying thicknesses of wads may be separated from each other, and each grade of wads may be used together, so that the loads in the shells may have an absolute uniformity in every respect. It consists of a vertical receiver into which the wads are placed, a segmental swinging-shoe moving beneath the receiver, together with a rotating table having radially extending arms with clamps or holders at their outer ends, beneath which the wads are deposited by the moving shoe, and a cam which acts upon these rods so as to deposit the wads into the proper receptacles, which are arranged around a periphery of the table.

GRAIN SEPARATOR.—John Grider, Stockton, assignor of one-half to Geo. Chestnutwood and Thos. N. Moore. No. 375,486. Dated Dec. 27, 1887. This is a new and useful improvement in grain separators, the object of which is to prevent the riddle or shoe from becoming clogged with the weeds and short straws discharged upon it by the grain belt, and at the same time to more effectually clean the grain, so that but a small proportion is returned to the cylinder, whereby the elevator and conveyor are never choked. The racks not only have a forward and backward movement, but a lifting movement as well, which tosses up the material and thus gives the fan-blust such power and direction that the separator is more complete and most of the grain is saved at the forward end.

## Foundry Notes.

During the past year the foundries have been doing a better business than for some years. The rapid settlement of the State, the inauguration of new enterprises and development of old ones, have been the cause of numerous orders. The foundries have melted over 13,000 tons of pig iron during the year, and there has been an immense consumption of wrought iron also. The largest single piece of work started here during the year was the construction of the Government cruiser Charleston, at the Union Iron Works. At the present time, the hull is finished up to the protective deck, while above this to the main deck only the frames and deck beams are as yet in position, leaving all this upper portion to be plated. The steel stern-post recently cast at the rolling-mill, and weighing nearly five tons, is now being put through the machine, prior to its being covered with the plating.

The engines are well under way in the course of construction, many of the working parts being already finished, while the larger and stationary parts are rapidly becoming so. Many of the smaller engines to be used for various purposes in different parts of the vessel are already completed. As soon as this vessel is completed, another cruiser will be laid down on the same stocks.

The Pacific Rolling-Mills are very busy in building cable railroads, turning out miscellaneous work and furnishing material for the Government cruiser. In another column we give some details of tests of the steel made at these mills.

The new building for the shops of the Fulton Iron Works, to replace those destroyed recently by fire, is nearly completed. New tools have been purchased, and before long the works will be in better shape than ever.

The Risdon Iron Works, like other city foundries, have plenty of work on hand.

Mr. A. P. Brayton of the Pacific Iron Works is still in the East.

Patrick Noble, superintendent of the Pacific Rolling-Mills, has returned from Los Angeles, for which city the mills are doing a large amount of cable-railroad work.

The Golden State and Miners' Iron Works have in hand one of the largest set of hoisting works ever made on the coast. The machinery is intended for a coal mine in Washington Territory.

## Split vs. Solid Pulleys.

We take from *Power and Transmission* the following concerning the Dodge patent separable split pulleys, for which John Simonds of this city is Pacific Coast agent:

In a well-known machine-shop, not long ago, a stop was made to overhaul the main line shaft, which needed straightening and lining up. A strong force of men was set at work and a scaffolding erected underneath the shaft in order to permit the men to reach their work. About one-fourth of the pulleys on the shaft were wood-split pulleys of the Dodge patent, and in less than half an hour they were off of the shaft and lying down on the floor. The remainder of the pulleys were of the ordinary cast-iron pattern, and the rest of the day was occupied in getting those cast-iron pulleys off of the shaft in order to take it down and straighten it.

The next day was spent in putting those iron pulleys back again, and after they were in their places and the shaft put up once more the split pulleys were restored to their positions on the shaft in as short a time as it had taken to remove them.

The remark was made at the time that if all the pulleys on the shaft had been wood-split pulleys, the entire job could have been completed in one day, and the delay of the second day's stoppage avoided. The greater probability is that if the shaft had not been obliged to carry the weight of the heavy cast-iron pulleys it would not have needed straightening at all and the stoppage and straightening might have been avoided altogether.

## New York Metal Market.

Telegraphic advices dated Jan. 4th give the following New York prices:

BAR SILVER—96 3/4 per oz.  
BORAX—\$4.00/cwt.  
COPPER—LARS—\$17.37@17.25.  
IRON—No. 1, \$22.00.  
LEAD—\$5.00/cwt.  
TIN—\$36.50.

The following is the latest by mail from the "New York Metal Exchange Market Report":  
COPPER—Quiet, spot closing at \$17.55@17.70. Transferable Notes (Lake) issued at \$17.25@17.50.  
LEAD—Steady at \$5.00@5.15 spot. Transferable Notes issued at \$5.10.  
IRON—Dull at \$36.37 1/2. Transferable notes issued at \$36.45.

MAKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50@21.00; No. 2, \$19.50@20.00; Grey Forge, \$17.00@17.50; Hudson River, Grade No. 1, \$20.00@21.00; No. 2, \$19.00@20.00; Grey Forge, \$17.50@19.00; Southern, Grade No. 1, \$20.00@21.00; No. 2, \$18.50@19.00; Grey Forge, \$17.00@17.50.

Price generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$38.00@37.25; Billiton Tin, \$37.00@37.50; Banca Tin, \$37.00@37.50; Baltimore Copper, \$14.75@15.25; Orford Copper, \$15.25@15.50; P. S. C. Copper, \$15.00@14.00; Foreign Lead, \$5.40@5.50; Foreign Spelter, \$6.10@6.50; Antimony, \$14.00@15.00.

## The New River Mines.

We had a conversation a few days since with Mr. Toma of the Ridgway Mining Co., New River, Trinity county, who passed through this city on his way to London, where he goes to consult with the English owners with regard to the work to be done next season. It is proposed to run a tunnel some 700 feet to drain the mine. The ledge was followed down 240 feet, but there is now so much water that the drain-tunnel is proposed.

Mr. Toma says that the New River region is a pretty rough one just now, there being plenty of snow and no roads. In his opinion, it is only a question of time when the camp will come to the front. The great trouble has been that the miners there are mostly all poor men, but the mines are being worked and put in shape for proper development. There are now only about 100 men in the camp, most of them having gone away for the winter. The boom the district got when first discovered was bad for it, as it came too soon and before they knew what the claims amounted to. Very few sales of mining property have been made. The Ridgway mine sale was made in London. There are a few small mills in the district, and the ore is all free milling.

In Mr. Toma's opinion, when a good road is built into the district it will be from Weaver-ville. So far most of the supplies, etc., are packed in by way of Callahan's ranch; all the machinery had to be packed in also. It may take a few years to develop the camp properly, but the mine-owners have faith in the good showing they have made. In the bottom of the Ridgway they have a four-foot vein of fine milling ore that will average \$40 per ton, some of it running up to \$100. The Golden Gate is a very fine prospect and so is the Carrie. The Mountain Boomer has paid right along and has ore worth \$80 to \$100 per ton. The Uncle Sam makes a good showing, and several other claims are doing well in a small way. Prices of provisions are not as high as might be expected, as it is only 45 miles to Callahan's, and vegetables, fresh meat, etc., are plentiful. For a mining camp, articles may be purchased quite reasonably. There is plenty of water in the district for use in the mills, but not enough for power. There is no chance for water-power nearer than Virgin and Eagle creeks. If this could be utilized and transmitted to the camp by electricity it would be a great thing for the district, and the subject will be investigated in time. It is the general opinion that when the present obstacles to successful working are removed, many other mines will be properly developed.

THE *Phoenix Herald* says: There is no mistaking the richness of the placer diggings in the district of La Paz and Ehrenberg, Arizona, on the Colorado river, but the scarcity of water renders the working of them almost an impossibility.

It is reported that the Temescal tin mines, near South Riverside, are soon to be practically worked.

## Workingmen's Houses in Mulhouse.

Mulhouse in Alsace is noted for its industrial societies, which care for the dwellings

a speckled rough coating in hydraulic stone and mortar. The rain-water, with that for the kitchen, runs away through paved trenches near the sidewalks until it reaches a sewer.

FRONT

PLAN

SECTION

ELEVATION  
SIDE

WORKINGMEN'S HOMES AT MULHOUSE, ALSACE.

of workingmen employed in the factories there. In a recent number of this paper we gave a description of one of the types of homes in that place. On this page are shown elevations and plans of others. The price of a group of houses such as are shown in the cut is \$1971.60. The area covered by a house is 52.76 square yards; the total area covered by a house and garden is 180 square yards. The monthly rent charged is \$2.60. The lintels and window-sills are of stone, and on all the stone lintels there are delivery-pipes. The walls are covered with

The houses are embanked outside. By paying \$3 72 a month instead of \$2.60, the tenant becomes the owner at the end of 15 years. The cuts are self-explanatory. The plan shows one-fourth of a block, and there are four houses in each block.

The latest discovery of gold and silver in the East is at Warsaw, Wisconsin, where \$40 gold ore is reported. Strange to say, no "old California prospector" has turned up with a favorable opinion.

## Mineral and Agricultural Lands.

It is a defect in our system of land laws that mineral land may be readily taken up and patented as agricultural, unless some interested individual chooses to make a contest. In most cases there is no contest. Men make application for patent on the land, and unless there is some one who knows of mineral there, and is interested in reserving it, goes and makes a sworn statement, the land is given to the applicant. A good deal of mineral land in this State has been taken up in this way, and the prospecting area thereby much reduced.

They are having difficulty of a similar kind in Montana, where the railroad company is getting possession of mineral land, though it cannot be directly and immediately proven to be such. The point is that a large portion of the mountain lands in Montana, which are surveyed by Government surveyors, are returned to the General Land Office as more suitable for agricultural than mineral purposes, and that immediately upon being so returned they become subject to the action of the Northern Pacific land grant as far as odd sections are concerned, and that the company upon the payment of fees can demand patents for the lands, and that after a patent has been issued the lands become indisputably and solely the property of the railroad company, whether containing mineral or not; and no person can contest the right of the company to these lands, that privilege resting solely with the Government, and even it can do nothing unless fraud is shown in the procuring of the patent.

It is suggested that a remedy for this is for the people of Montana, and especially the mining portion, to petition the General Land Office and Interior Department to declare all mountainous country mineral lands, and thus exempt it from the action of the Northern Pacific land grant, and throw the burden of proof as to the agricultural character of the land upon the railroad company.

If the private claimant or a railroad company once gets the patent, the title cannot be disputed except by Government, and by it only on the ground of fraud. A protest has been sent to the Secretary of the Interior detailing the situation and asking that patents to the Northern Pacific railroad for lands in the mountainous districts of Montana be withheld for 60 days, until ample proof could be furnished the President and Congress that all mountainous lands in Montana are more valuable for mineral than for agricultural purposes. The protest also states that all mountainous lands

in Montana are mineral and not agricultural. THE December pay-rolls on the Comstock mines amounted to upward of \$220,000. This does not include Silver City mines or mills. Cons. California and Virginia pays the largest amount—\$45,915.

THE Vizona mine at Tombstone, Arizona, has been sold under a deed of trust for \$4000. It was purchased by the Ground Hog M. Co. The mine, which has been idle some time, will now be worked with a full force.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

## Crushing Quartz.

## A Comparison Between Stamps and Rotary Pulverizers.

[Written for the Press by W. C. STILES.]

This article is intended for practical thinking men, for such I am supposing myself to be addressing. We are in an age of progress. What we thought to be an impossibility yesterday can be done to-day, and the man who proclaimed it yesterday was considered a crank. What made him a crank? Simply this and nothing more, he dared to think and act for himself; hence I place myself in a cranky position for daring to attack so popular a machine as the present quartz-mill—the stamps and batteries. Men undertake great works who have some motive, and are apt to go in old tracks expecting to have some new ones present themselves. They are not thinking for themselves. They are guided as the locomotive is guided with two rails lying parallel. The thoughts I am penning may not be original, yet the work may appear so in the end.

## The Present Method of Reducing Ores

Is as old as the hills—in fact nature teaches it by one rock beating against another, crushing some parts to an infinitesimal powder and leaving others in larger form, say from the size of grains of wheat upward. When any one wishes to prospect rock he selects a few pieces, places them in a mortar, gives them a few beats with the pestle, turns the mass into a sieve and shakes it, leaving the coarser in the screen. This being done, he repeats the pounding, liberating more of the sand, etc., until all is ended, if he is driving at fine results. But if roughing it, his first and second crushing is sufficient to arrive at some conclusion without wasting time on what a practical man knows is of little value compared with that he has already liberated. If in the first and second pound he gets no results, the word of an old miner for it, he will not look to find it in the third and fourth and at the finish. Now the question is this: Does the first and second crushing liberate the rich or worthless? If the rich, then if possible remove it from the deteriorating influence of the worthless gangue, and the sooner the better. This, the

## Battery System of Crushing.

Cannot do, for when a piece of rock is placed in a battery there it must remain until worn out by attrition or blows from the pestles. We now take for example a piece of rock weighing one pound. This piece falls directly under the stamp. The weight falls, this piece of rock is crushed and knocked into thousands of pieces; the soft yields to the hard, leaving many pieces varying in size from a mote to a good-sized bean. This begins to form a bed for other pieces falling into the battery to lie upon. As the battery is jarred it is reasonable to suppose that the heavier parts are settled to the bottom of the battery. If they are gold, it at once places the precious metal in a bad position. If it consists of sulphurets, it also does the same with them. Now when do these heavier and most valuable parts get away from this eternal pounding? To satisfy ourselves about

## The Wear of Gold

We need but take a piece of gold, say a \$2.50 piece, give it a slight rub against a stone, and the stone is not affected, but marks are visible on the stone of the presence of gold. In crushing a ton of ore containing \$8 per ton we crush with it 64,000 times its weight and 320,000 times its bulk in quartz sand. This rubbing motion goes on for days if it does not accidentally get out, or is attached to the linings inside, which you say it does in a short time after it becomes detached from the matrix. If so, why can we find the finer particles of sand assaying much more than any other portion of the sand? From this it is plain to be seen there is something wrong. The power expended on the stamp is too great for the work done. The power required for one stamp dropping 90 drops per minute is  $1\frac{1}{2}$  horse power. The stamp is supposed to do two tons to the stamp (the average is less). The stamp requires more power to run when there is little to do than when full. The stamp breaks off instead of showing an even wear. (I am speaking of ordinary shoes and dies.) Now comes the question,

## Can There be a Plan Devised

By which this mighty waste may be obviated? I answer, yes. The rock-breaker is the first step taken for breaking and placing the ore in a condition for saving. When the rock is given a squeeze, or pinch, or crush, it at once lets the mass go. The rock is cracked and broken in its weakest place, as where seams of sulphurets and gold join the silica together. These sulphurets fall out and also the gold. Then they should be taken away from the large, hard silica which remains intact until the end. But as a general thing the sulphurets fall away in lumps varying in size from a pinhead to a fist-bert. This, then, is not in concentratable form, and has to go through other rock-breakers or pulverizers until all is liberated from the gangue and can be banded by some concentrator best adapted to coarse and fine crushing,

which will be treated on during this article. The question will arise here,

## How Fine Must we Crush?

One kind of ore requires one degree of fineness, and another a much finer. We will take, for example, our ores as they come from Nevada, Placer, Amador and Shasta counties, and, in fact, throughout the State, and they will stand a No. 16 wire-screen, giving at this point greater satisfaction in sulphurets and free gold than at any other point. The sulphurets are coarse, and there are less slimes. The gold is as natural as old Mother Nature formed it with no wear or tear, and left to rest as soon as set free from its mother bed. Now comes the manner in which this thing may be accomplished. The Cornish roll will do this work to perfection, but the Cornish roll is not a good stayer, that is to say, the parts that are brought into use on the ore are soon in bad shape, so that it is not profitable to work them. Some other plan must be made use of to arrive at the required end, viz., leaving the gold and sulphurets in a granulated form without so much wear of machine. And now comes the cranky part of this article.

I propose to place before the public a machine which is to cost but one-eighth of what a stamp plant costs, but one-tenth the weight, and requiring but one-half the power to reduce the ores. The wear and tear is not as great as the stamp batteries, and but little time is required for renewing parts; when once renewed the mill is as good as when it first came from the foundry.

## The New Mill Pulverizer.

As now built for best practical results, is small and compact, requires but little room and takes but small power. It will crush wet or dry, as best desired. The total weight of the mill for ten tons in 24 hours is 1000 pounds. Three mills will crush 30 tons per day, leaving the gold perfect and the sulphurets the same. The largest piece of this mill will not exceed 240 pounds in perfect shape for packing over the worst sort of country.

The concentrator will handle 10 or 20 tons per 24 hours. There are two sizes built; total weight of small one, 750 pounds; large one, 1000 pounds. It will handle any kind of ore rapidly, giving the best satisfaction.

## Action of the Pulverizer.

Many are anxious as well as curious to know how so small an amount of iron can do so much work. There is no secret about the working of this pulverizer. It is plain in construction and when put in motion it explains itself. It is positive in action and nothing slips, but fastens itself to the jaws or revolving disks, letting go its hold after passing a given point in its revolution. Nothing is carried through the second time. It pinches the rock to the size the mill is set to, dropping, for further reduction, though still finer set machines.

This machine will pulverize half an ounce at one revolution, taking the quartz from the rock-breaker the size of filberts or walnuts, and reducing it to the size of ordinary beans. Much of this crushing will go through a No. 40 screen and all in a granulated form. This is passed on to the concentrator and is as a general thing the richest portion of the quartz. The balance goes through the same process for reduction, fracturing the ore in its weakest points, when it again undergoes a sifting, taking the rich ore from the poor, each time the pulverizer is set firmer. Some idea may be formed by the following

## Description of the Machine.

The pulverizer is made with two compartments, each independent of the other, so that one may crush coarse and the other fine, or both coarse or fine. Each compartment presents a working surface of 110 inches; the two, 220 square inches. In order to do one-half ounce each revolution, the mill will have an average of a little over one grain to the square inch of working surface.

Suppose the mill to run at a very moderate speed of 600 revolutions per minute, it would then pass 300 ounces or 18 $\frac{3}{4}$  pounds. This for one hour is 1120 pounds, or for 24 hours 26,880 pounds. Can any man say how long it would take to wear four steel plates with but one grain of quartz average to each square inch down three-eighths of an inch?

Now let us suppose that they would wear out in 24 hours. The cost would be 30 cents per ton. If they have life for two days the cost would be 15 cents, and should they last eight days, then the cost would be 3 $\frac{3}{4}$  cents per ton for each ton crushed. But a figure will be made at 30 cents, and the batteries are scarce that will compare with it. Nothing has been said about the

## Saving of Precious Metals

In per cents in a stamp-mill. We will deal with from \$5 to \$10 medium-grade vein stone. The time has been when each rock would yield but 50 to 60 per cent of its true value. The mills give better results now, say 70 or even 80 per cent. This is accounted for by their not eliming so much. If this sliming ceases and 90 or 95 per cent of the sulphurets can be saved, then the same amount of gold can be saved. Now if ten per cent can be saved with the new system on \$10 ore, it would give an extra dollar to be placed to the credit of new mill, which wipes out wear and tear entirely.

Another thing to be considered is power. Suppose a stamp can be run for 25 cents per ton and the small mill takes but 12 $\frac{1}{2}$  cents per ton, there would be a profit of 12 $\frac{1}{2}$  cents over the old method which wipes out half the wear again. Space, loss of quicksilver, etc., are

great items which figure largely in low-grade ores as well as high.

One cent per pound in quartz rock gives \$20 per ton in value; a little over one-third of a grain of gold, a piece as large as a pin-head. We will crush one pound of ore to the size of one-sixteenth of an inch. In order to pass No. 16 sand, it must be reduced to one-thirty-second, for the reason that the wire takes as much space as the holes occupy. Then, if we reduce the ore to this size, all being equal there would be in one superficial inch 1224 grains of sand; for one cubic inch, 32,778. This is but the one-twelfth of a pound—393,216 grains to the pound. Supposing them to be of equal size, the gold would be about as one to 98,304. We start off with this proposition, there being 98,304 grains of sand to one of gold. How long will this grain of gold last before becoming slimed sufficiently fine, so that slightly moving water will hold it in suspension as easily as it holds other matter for an indefinite period?

## Drop of Stamps.

Our stamp-mills in early days made 60 drops per minute. A well-appointed mill at the present is supposed to drop 90 drops per minute. For one hour, 5400; for 24 hours, 129,600 to the single stamp; for five-stamp battery, 648,000 drop. The Treadwell mill of 120 stamps, on Douglass island, Alaska, gives 15,552,000 drops per day. What is this almighty racket kept up for, day after day and year after year? To liberate gold, say at the rate of \$3000 per day, then for every dollar saved the stamps have made 5184 drops and saved 160 pin-heads, or its equivalent in size. This estimate is at 300 tons per day, at \$10 per ton, or 51 drops for every cent.

## Fine Crushing.

Suppose we have not crushed our ore fine enough to liberate all the gold and there should be a piece of sand, half gold. In ordinary handling this would be rolled along over the copper plates and other devices for saving and lost. This is wrong, for if we take these sands containing gold, they can be horned or panned out, from a sampled lot, say an ounce or pound of ore. Then why not on a larger scale? A piece of quartz half gold stands as one to 6 $\frac{1}{2}$ ; now our piece of sand is half gold. It has passed the No. 16 screen and been subjected to the action of water. The shape varies considerably. The specific gravity does not save it, but it is drifted among the waste, although the piece weighs 6 $\frac{1}{2}$  times as much as its associates. Here we must look for the cause, which has already been answered. Now we have a piece with but one-twelfth gold and eleven-twelfths silica. Then this piece, although nearly all quartz or silica, is five-twelfths times heavier than the pure silica, and fully as heavy as the sulphurets that are being saved by the present mode of concentrating, viz., the Frue vanner and Triumph machine.

## Gold in Quartz.

The gold in quartz rock varies, and sometimes we find pieces as large as your fist. Other pieces of quartz have little pockets in which the gold is found in all manner of shape; then it is found in seams of the rock, binding the rock together like wires. When this ore is fractured it will follow those seams; it also does the same if filled with sulphurets. This being the case, let us put a piece under a pressure of 1000 pounds to the inch, and the silica immediately gives way and the gold is left in its primitive state, with the marks of the matrix upon it. If left to rest and there is no more rubbing, we get all the gold the rock contains; but if allowed to be operated on by foreign matter it is carried away as before described.

## Iron in Mills.

The statement in regard to batteries is easily figured. One stamp (the ordinary stamp) with mortar, chafing, hoxes, bolts and frame, will average one ton to every stamp or 10,000 pounds for a five-stamp battery. For crushing 100 tons of ore per day it would require 50 stamps, each to crush two tons or altogether 100,000 pounds of iron and wood for frame, etc. The stamps crush about one-half of an ounce of rock each drop, which can be done with an ordinary hammer if properly applied. They require  $1\frac{1}{2}$ -horse power each to drive them. Then according to this calculation we employ a stamp to crush out two cents per minute, requiring  $1\frac{1}{2}$ -horse power; for 50 stamps, 56 $\frac{1}{2}$ -horse power. After the foundry and machine work has been done are we ready for operating this ponderous amount of iron? No. There is freight to the mine, grading for the millsite, etc. Care must be taken to have it solid and nothing light will answer. Independent of these mortars and stamps a large engine must be provided. If to be run by water-power, a wheel of suitable size must be built, for 56 $\frac{1}{2}$ -horse power is not always at command. To move this 100,000 pounds would require 25 teams of two tons each, or 4000 pounds. These teams when under marching order would occupy one-fourth of a mile. If this material is to be packed over mountains it would require 500 mules to do it, each taking 200 pounds. Supposing each animal to occupy eight feet, and we have a string of packers 4000 feet long, or four-fifths of a mile. This would be a fine sight up in Alaska where the beasts of burthen are allowed to go as they please, down off the trail into the underbrush, down into the canyon, etc. It is a good thing that this machinery has to be put upon the cars from drays. Then we have the handling of 100,000 pounds of freight at one cent or five

cents per pound. If at one cent it cuts up \$1000. If the maximum figure, \$5000.

The machinery on the ground, skilled labor is required to adjust it, which is not always at command, even in San Francisco. We have already spent a little fortune in what has been done. The work now is just begun, grading first, then anchoring the batteries, etc. This being done, the work of destruction has been commenced, as has been described. The ore is sent whirling out through the mill without any more thought and tumbled into the sea.

## Loss of Iron in Crushing.

Now as to the wear of the battery shoes and dies. A 50-stamp battery requires 250 pounds of iron for each stamp, making 12,500 pounds to shoe and die. In ordinary batteries they require renewing once in a month. Each stamp is credited with crushing 50 tons. This shows a wear of five pounds to every ton of rock crushed, which is one grain and one-fifth of a grain to every ounce of rock crushed. One grain of iron is quite a nice little body, and can be weighed without any very fine assayer scales. This iron is never seen in the concentrates. Where has it gone? The cost of this material will be, say five cents per pound, or \$625.

The pulverizer, of which I speak, requires 480 pounds to shoe all round. This gives us 12,500 pounds to wear out in 25 days, allowing a renewal every day; each renewal would require two men 1 $\frac{1}{2}$  hours; 25 changes would be 37 $\frac{1}{2}$  hours, or less than 4 days in one month. The stamps require 2 men to each 10 stamps, which is 10 days' time vs. 4 days, a gain of 6 days. But our proposition is to get from four to eight times the wear out of the little mill. If four times, we would wear but one-fourth the iron and consume but one-fourth the time for repairs.

We are told by metallurgists that the water from a battery always shows traces of gold and silver. Each stamp requires 10 pounds of water per minute, or 7 tons in 24 hours; a five-stamp battery 35 tons. Now, as each quart or pound assays something, the amount in 35 tons must be several dollars, which comes from the wearing of the gold agitated in the battery, and which is resting after passing the small mill.

## Action of the Stiles Mill.

How is this expense to be avoided? Pulverizers of some kind must be made use of before any suitable results can be obtained. Our proposition was to do this work with one-tenth the weight of iron, at one-eighth the cost, and save more gold.

I propose to furnish a mill that will crush 100 tons of quartz rock in 24 hours for one-eighth the cost of the stamp, the total weight of which will not exceed 10,000 pounds. This mill will save the gold and sulphurets in a granulated form and save a greater per cent than stamp-battery has ever done. The figures show a difference of 90,000 pounds on the item of battery and stamps versus this method of revolving disks. It has been shown that the stamp will crush one-half of an ounce at each drop and can drop 90 drops per minute. The revolving system will produce each revolution half an ounce to three ounces. There may be 10 revolutions or 1000 revolutions per minute, each whirl producing the amount set forth, viz., one-half ounce or more, preparing the sand for concentrating and amalgamating. These concentrates are the first to give way under pressure, and are removed from further crushing until wanted, when they undergo finer pulverizing with but little wear to the machine and no wear to the gold. The richer parts of the rock are broken away from the poorer at the beginning, in the proportion of 1 to 4—that is to say, one-fourth of the rock is made fine enough through the first mill.

It may be well to say here that the pulverizing is done by degrees, the first mill making it the size of corn; second to wheat, and the third to finish, leaving the gold to rest after the third crushing. This first sifting, although giving but one-fourth fine, contains three-fourths of the sulphurets in the ore, proof positive that the higher portion yields to the first blow, and should be protected then and there. The second crush liberates two-thirds of the remaining sulphurets and gold. When the rock is treated in this manner by degrees, the gold, instead of being made finer, is rolled larger so that very little of it will go through a No. 30 screen or 900 mesh to the square inch. It may be readily seen by a practical man that the gold will always be found in one place, while the sulphurets are undergoing concentrating without any danger of the gold being carried away with the moving water, of which we now propose to treat.

## The Concentrating Tables.

The Stiles concentrating tables have a capacity of 20 tons per 24 hours. The structure is a vibrating table operated by a cam, the area of which is 2000 inches. The pulp is fed on the upper end where a stream of water carries it from beneath the revolving disks and automatic screens of the mill. This table is subdivided into 32 compartments. The material in each one of these compartments is kept in a soft, mushy condition by an automatic scraper passing through the pulp four or five times per minute, always scraping up but never touching the pulp in its backward course.

As the sands are kept soft, it is difficult for the heavy particles to go over this soft spread bed without sinking into the mass. When once buried, one or two sands cover them and protect them from the action of the moving water. As the table is continually jarring, these

particles are drafted toward the head of the table, assisted by the moving scraper. As this scraper approaches the head of these compartments it rises out of the concentrated mass, carrying a portion upon a rille on the next shelf or compartment. A carrier to B, B to C, and C to D, where they are landed into a tub or vat with the gold and golden sands for amalgamation. Here you are with your sulphurates, if you have any, but your gold is safe at this point, the thing of all others we have so puzzled our brains about. Any one who is familiar with the concentrating of ores knows that handling 20 tons of sand per day is big work. He will spread one cubic foot of sand over the surface of the table and it would not be one inch deep over the entire table. But we do not propose to put a cubic foot of sand on per minute, for if we could work that amount we could handle 72 tons per table. Now what we desire to do is to work 18 or 20 tons or say one-fourth of a cubic foot. Then there would require a removal of sand of an average of one-fourth of an inch per minute. In case you do not use water enough, the sands will bank on the table. The first minute, one-thirty-second of an inch, and in eight minutes the table has an overplus and becomes useless. But an over-supply is favorable to the best results. The water will carry away the worthless, leaving the best always free. This concentrator will carry a certain quantity of sand before anything is discharged. After the table is full then the separation begins, the good at the upper end and worthless at lower end, where it will remain until displaced by an additional amount of sand from the pulverizers. This is a safety machine, for the heavy will be driven to the bottom by the concussion, and the light carried off by a current of water. These concentrators are made of iron and steel, the heaviest piece weighing but 162 pounds; total weight of machine, 1000 pounds—complete and intended to work on any kind of ore.

It is specially efficient on galena or carbonate ores. The power required to run one of these machines is rated at 4-horse power. The cheapness of the machine places it in the power of a poor man to buy, and he saves his gold without placing it in the hands of strangers. Our task is ended, and if any one can be benefited we are pleased to hear you say so.

**MINES AND NEWS-PAPERS.**—The papers in all mining districts are urging miners to contribute mining items for publication in their local columns. Miners should heed these appeals, for if they look over the Denver dailies as also the mining papers of San Francisco, St. Louis, Chicago, and New York, they will find that the majority of the mining items appearing in their local newspapers are copied in metropolitan papers. The miner should understand that although his local newspaper may possibly have somewhat of a limited circulation, it has also an exchange list, which gives a medium through which well-written articles can reach thousands of readers all over the world. Support your home paper whether you dislike its editor or not, even if you do not fancy its appearance. The press is friendly to the mining interests without regard to locality, and no charges are made for publishing facts about the progress of mining enterprises. Don't expect the editor to take greater interest in your welfare than you do yourself; though as a general thing editors do. Mining items ought to originate with the miner, leaving the paper the simple task of publishing them.—*Register Call.*

**H. S. MOREY, proprietor of the Placerville Foundry and Machine Shop,** is putting up a steam engine to run the machinery of his shop. He has heretofore relied upon water-power for this purpose, but owing to the ditching freezing up, and at times no water in them to supply his demand, he has been seriously inconvenienced. The same power will be utilized to run Beach's box factory, which has been idle for want of water.

**LUMBER FOR SAN DIEGO.**—During the past year 350 vessels entered the port of San Diego with lumber cargoes. The total amount of lumber carried by the vessels was 154,160,000 feet. A fair average of the price obtained for the lumber would be \$30, at which figure the value of lumber importations at the port for the year would be \$4,614,600.

### A Glimpse at Santa Cruz.

We here give a glimpse of the city of Santa Cruz as seen from an adjacent elevation, the view being westward out upon the bosom of the Pacific ocean. For this engraving we are indebted to a publication by the Santa Cruz Development Association, already named and written by Mr. I. H. Raymond. It is one of the best written of the descriptive pamphlets now being issued about California points, and should have a large circulation. The history of the region from the first period by Cabrillo in 1542 is sketched in a very interesting manner. The charms and resources are all faithfully put forth, and not least interesting is the appendix which contains a list of the fish of Monterey bay and the native trees and shrubs of the Santa Cruz district by Dr. C. L. Anderson. We have not space to reproduce these important matters. In connection with the engraving, however, we give a paragraph descriptive of Santa Cruz City as follows:

Situated on the northern side of the bay of Monterey, that magnificent horseshoe-shaped sheet of water, 22 miles from point to point, which indents Monterey and Santa Cruz counties, the city of Santa Cruz extends backward from the beach across a slightly elevated plateau, and then climbs two or three terraces, which encircle the lower part of the town like the seats of an amphitheater. The business portion of the town lies on this plateau and along the water front. The main street, Pacific

### Elko Shale-Fields.

It is not generally known outside of Elko that valuable shale deposits or veins exist in the immediate vicinity of Elko. Their existence has been known by the Elko folks since the first organization of the town, in 1869, and in consequence of these large bodies of shale being encountered it was believed that coal must exist, hence a great deal of prospecting for coal from 1871 to 1873 without any very substantial results. The most of the prospecting was done by individuals who possessed slender means, and the result proved nothing but a failure to the parties concerned, as they did not sink deep enough. In 1872 the C. P. railroad sunk to the depth of 300 feet. At the bottom they struck a four-foot vein of coal of what was believed to be a fair quality of anthracite. But at this point a perfect deluge of water was encountered, and Mr. Mitchell of Pennsylvania, under whose charge the work was being carried on, pulled up his machinery and left. Notwithstanding these drawbacks, coal experts still contend that where large bodies of shale exist coal may be found, and that all that is required is capital. This shale-field lies on the east side of the town and river about one and one-half miles. About one year ago the larger of the several veins of shale heretofore opened was relocated by W. W. Rogers, late county recorder, and Joseph Lang. I also understand that James Russell is interested in the same. These gentlemen have taken out several car-

### Academy of Sciences.

There was no contest at the annual election of the Academy of Sciences on January 3d, and the regular ticket was elected as follows: President, H. W. Harkness; 1st vice-president, H. H. Behr; 2d vice-president, George Hewston; corresponding secretary, Henry Ferrer; recording secretary, William F. Smith; treasurer, I. E. Thayer; librarian, Carloe Troyer; director of museum, J. G. Cooper.

Trustees—Chas. F. Crocker, D. E. Hayes, S. W. Holladay, George C. Perkins, Jacob Z. Davis, E. J. Molera, E. L. G. Steele.

The treasurer's statement showed: Balance in bank January 3, 1887, \$2736.98; receipts during the year from life members, \$100; resident members, \$1524; Crocker fund, \$1200; rebates, \$39.98; rent from Market-street property, \$5496.88; trustees paid in, \$5.60; total, \$11,103.44. Expenditures—Taxes, rents, salaries, etc., \$9256.22. Balance on hand, \$1847.22. Summary of the General Fund—Balance on hand January 3, 1887, \$2175.96; receipts as above, \$7166.46; total, \$9342.42; disbursements, \$8256.22. Balance on hand, \$1086.20. Crocker fund—Balance January 3, 1887, \$561.02; receipts during the year, \$1200; disbursements, \$1000; balance on hand, \$761.02.

The thirty-fifth annual report of the librarian showed the number of books received during the year to have been 2825.

It was reported that 114 specimens had been received in the museum. In the herbarium 1750 specimens were received. Additional

cases are needed in the department of mammals and birds. Many a specimen were received in the department.

Corresponding Secretary Henry Ferrer made his report, telling what publications had been sent and what letters had been written to members and foreign correspondents. The exchange list includes about 600 societies and individuals.

The recording secretary's report showed: Added to membership during the year, 14; lost by death, 4; resigned, 8; dropped for non-payment of dues, 16; total present life membership, 268. Three bulletins had been published, the last, No. 8, completing the second volume.

Professors Joseph and John Le Conte of the University of California were unanimously elected life members of the academy. The following were elected honorary members: Prof. Alexander Agassiz, Joseph Leidy, L. P. Langley, J. G. Browngood, Francis P. Walker, A. E.

Verrill, W. K. Brooks, Mrs. E. B. Crocker, E. D. Coke, A. S. Packard, E. V. Riley, George H. Horne, Clarence Dutton, Elliott Coues, C. B. Corey, Alphonse de Oudall, H. B. Medlicott, James Hector, W. G. Farlow, C. T. Cressoy, Joseph Lovering, Francois Crapin, Maurice Chaper, Theodore Loeferle, E. A. Regel, M. D. Sansure, D. C. Danillson and G. A. Saz.

### New Mexico Copper Mines.

The New Mexico *Interpreter* says: The rapid rise in copper will have a tendency to put into active operation all the rich copper mines of the Territory. The former price forced the copper properties of the West to either shut down or to run on little or no profit, but with advance of price from six to seven cents per pound the industry will be rapidly developed and unproductive properties be made to pay.

New Mexico has some copper properties which under the present price of copper will pay well. The copper and lead mines at Red Cloud, 45 miles north of White Oaks, will pay to haul to Albuquerque, 115 miles. The Tenderfoot mine, that is developed to a depth of 115 feet, has a fine body of ore that will and should be worked, but during the depression in copper and lead it could not be made to pay, counting the long wagon haul. The same could be said of the copper properties of the San Andreas in Socorro county. The magnificent copper oxide mines of the Cahallos range, now the property of a gentleman in Wisconsin, have increased in price during the last 30 days not less than \$100,000.

**RELATIVE MELTING POINT OF PLATINUM AND SILVER.**—The total radiation of melting platinum is 54 times that of silver.

avenue, is of good width, and extends from the foot of Beach Hill nearly a mile to the Lower Plaza. It is paved with the fine native bituminous rock, large deposits of which are found in several portions of the county. This forms, without combination with any other substance, an elastic and practically indestructible pavement for streets, sidewalks and cross-walks, and is being used to replace other kinds of walks and drives throughout the city. It is possible to go from the bath-houses at the beach to the Bay View school-house, a distance of nearly three miles, without once leaving an admirably kept sidewalk. Intersecting Pacific avenue are a number of rural-looking tree-lined streets, bordered with cozy, picturesque, and even elegant homes; almost every one surrounded by well-kept lawns and gardens in bloom throughout the year. This portion of the town contains the Courthouse, City Hall, Hall of Records, postoffice, two fine buildings belonging to the I. O. O. F., a Masonic Temple, a pavilion for floral and agricultural fairs, numerous excellent hotels and boarding-houses and several churches.

The terraces, mentioned in the letter above, offer most attractive building sites, many of which are occupied by residences and grounds, where the owners have vied with each other in tasteful ornamentation and adaptation of the wonderful possibilities afforded by climate and soil. Mission Hill is formed of two semi-circular terraces and a plateau, which was the site of the original Mission of Santa Cruz, and where the Roman Catholic church of to-day stands. Hotels and churches are also found on this hill. "Beach Hill" intervenes between the business portion of the city and the beach and is a favorite location for homes and hotels.

SAWDUST is now sent to market in bales, very strongly compressed.

loads of shale and have shipped it to parties in San Francisco and Virginia City, as it is believed to be heavily charged with matter that generates large amounts of gas. The result of the tests that have been made in San Francisco and Virginia City are satisfactory, and favorable rates can be obtained from the C. P. railroad. A large number of men will be put to work in making further explorations and in taking out shale, and doubtless prospecting will be renewed with more energy than heretofore, and coal may be found, all of which will give general impetus to the business of Elko.—*Cor. Reno Gazette.*

**A COLORADO GLACIER.**—High up in the mountains of Estes Park, and near the summit of Hague's peak, there is said to exist a veritable glacier. It has been named Hallet glacier, in honor of its discoverer. It is said by the *Pike's Peak Herald* to be evidently the remnant of one of the numerous large glaciers which flowed in all the upper canyons of the St. Vrain, Big Thompson and Cache la Poudre. Its greatest diameter is about one-fourth mile. Although shrunk to such small dimensions, it still preserves its true glacial character, as evinced by the ice of which it is formed and the numerous crevasses which traverse it. The crevasses are caused by the strain brought upon the ice by its own motion, and are peculiar to glaciers. The largest on Hallet glacier is 300 feet long, 10 feet wide and more than 30 feet deep, the bottom being filled with new snow, which the sun cannot reach. There are others—some open and some covered with a thin crust of snow.

**TIMBER WORMS.**—The worms which wrought great havoc among the spruce and juniper trees in Maine a few years ago have again made their appearance in the same role.

## Passing Events.

The whole State has experienced for the past week a "cold snap," longer continued than has ever been felt here before. In the mountains a great deal of snow has fallen, so there will be plenty of water in the streams next season. Around the bay region there have been ice and frost, to the astonishment of the "oldest inhabitant" and the disgust of the new-comer.

The Regents have appointed the astronomers to the Lick Observatory, and the big telescope has been tried roughly, so that in a few weeks we may expect the Lick trustees to turn the Observatory over to the Regents of the University of California.

A Consolidated Miners' Union is to be formed with headquarters in San Francisco, and branch organizations in mining districts all over the Pacific Slope. The main object is to influence Congressional action in maintaining a protective tariff on the products of mines.

There is very little new of moment in the mining situation on the coast aside from what is referred to in our summary of current mining notes.

THERE are now in operation in Montana Territory 35 mills containing 975 stamps, and 11 smelters having a capacity of 4430 tons. The mills crush about 2000 tons of ore daily.

THE receipts at the Helena (Montana) assay office for the past year amount to \$1,354,667.05. This represents in measure 71,114,639 ounces of gold and 36,222.35 ounces of silver.

SATISFACTORY observations have been made through the Lick telescope at Mount Hamilton,

## Why They Discover the Fountains of Wealth and Die Poor.

We attempted not long since to dispel the popular notion that the discoverers of rich mineral deposits generally come to a violent end, by citing numerous examples to the contrary. But while this theory seems so little tenable, it is, no doubt, the case that this class do, as a rule, profit little by these big strikes and rich finds. For reasons which we will in this article undertake to explain, the good luck of these men falls in a majority of instances to bring to them permanent enrichment.

It need hardly be stated that these great mineral discoveries usually and almost necessarily occur in wild and distant regions, such as only hardy and fearless, and perhaps it may justly be added, restless and impulsive men would be likely first to penetrate. But men of this character, while noted for their endurance and courage, are apt to be deficient in economy and thrift. They possess little of either the trading or the saving instinct. If they make money they spend it freely, and very often in a lavish and foolish manner. Being adventurous, they engage hastily in new projects. Entertaining large ideas, the bigger the scheme the more likely they are to take hold of it. And so in many of their enterprises they come to grief. These traits of mind found apt illustration in Marshall and Sutter, and account for their lack of business success, despite their grand opportunities. None but men of a sanguine, hopeful temperament, and possessed of a roving, adventurous disposition, like Marshall and Sutter, would have fled from civilization, and having the hardships and dangers of an early overland trip, made their way first to Oregon, and then, wandering south into California, have drifted to the back settlements of that then little settled country. They are active, brave and generous, but it is vain to look for frugality or sharp business habits in men like these, and who very well represent in their general characteristics the border man, the prospector and the mining pioneer.

Weaver basin, Trinity county, was originally one of the notably rich placer localities of California. In 1850 that part of the State was overrun by the Klamath Indians, the most brave and warlike tribe on the coast. Prospecting the country was such a difficult and dangerous business that few men cared to undertake it; yet a small number fought their way over the mountains into that singular depression, and living in the roughest manner, gathered there a rich harvest of gold; some of them, while so engaged, having lost their lives at the hands of the savages. The most of these adventurers having made a "stake," soon after left the basin, and we lose sight of them. Of those that remained, quite a number are still living there; but while all are tolerably well off, none are rich, and this not because they have been idlers or spendthrifts or in other ways dissipated their means. They have not been lacking in energy or enterprise; they have been engaged in turning rivers from their beds, building roads and bridges, ditches, flumes and tunnels, some of them works of great utility and magnitude. But the bent of mind that in 1850 carried these men into Weaver basin has since so far stuck to them that they have constantly been undertaking the premature or the impracticable, engaging in projects the success of which has involved too many risks and contingencies or in other ways taking desperate chances. And these pioneers of Weaver basin are typical of a large class of early miners.

In 1858 many thousand men leaving California emigrated to British Columbia, having been attracted to that country by the reported richness of the Fraser River mines. Disappointed in these diggings, nearly all of this emigration soon returned to this State. A few of these adventurers, however, determined to direct their course toward another quarter in their search after gold. Traveling southeast, they explored the country off that way for many hundred miles before they found anything to reward the dangers they had encountered and the incredible hardships they had endured, the region traversed being without any white settlements and infested by unfriendly Indians. The first pay digging struck were in Boise basin, Idaho, the still richer placers at Bannock and along Alder and Confederate gulches, in Montana, having soon after been found. Here the first comers reckoned their daily earnings,

not by dollars, but by ounces, and in some cases even by pounds of gold. Yet little did it avail the most of them. Not one in 20 ever retained any considerable share of his gettings; scarcely one in a hundred left the country rich. The very impulses that carried them to these marvelously rich gold-fields betrayed them into a course of life that led to their final impoverishment.

Their love of excitement, when they had the means to gratify it, plunged them into every manner of dissipation. Their natural generosity caused them to give without stint or reason, while their disposition to take desperate chances and to court fortune by hazardous methods caused much of their "piles" to go over the gambling table, these Montana mining camps having for years been a very paradise of the sporting fraternity. Careless of their own lives, these men were apt to be careless also of the lives of others, and so fatal encounters were not uncommon. Few of them ever left the diggings, the lives of a majority having, by one means or another, ended prematurely, if not always by violence. William Fairweather, the discoverer of Alder Gulch, supposed to be the richest ever found, died poor, having drank himself to death a few years later. He occupies an unmonumented grave hard by that famous locality. The most of his companions perished in the same way, fewer of these men having died violent deaths than is generally supposed. Following the discovery of these bonanza placers, large numbers of vicious characters swarmed into Montana, where, becoming at last unendurably dangerous, they were judiciously thinned out by committees organized for the purpose. But few, if any, of the pioneer miners suffered at the hands of these improvised tribunals of justice.

That this class of men, wherever we find them, are rough in their manners, nomadic and improvident, indulging all too much in hurtful excesses, must be admitted; but that they are inherently corrupt, vicious or depraved none will contend. Neither in this nor in any other country have their names figured much in the criminal calendar. What has here been said explains, we think, how it has so often happened that the discoverers of these great mineral finds have profited so little by their good luck, while it serves to correct at the same time the prevalent but erroneous notion that this class of men have generally met their end in some tragic or violent manner.

## Iron.

The stocks of iron here at present are quite moderate, and prices are higher than they were a few months ago. Stocks on hand now only aggregate 7535 tons. Of this, some 4295 tons are held by the foundrymen. The city foundries and mills melted last year 13,350 tons of pig iron. The scrap iron imported equaled 24,461 tons.

During 1887, according to the statistics compiled by I. Stewart, we imported 9430 tons of pig iron from Great Britain, and 1275 tons of soft iron from the Eastern States. From the stock of the Oswego Iron Co., Oregon, we procured 300 tons; from the stock of the California Iron & Steel Co., 900 tons; and from the stock of the Puget Sound Iron Co., of Port Townsend, 2505 tons.

The iron resource of the coast are not being developed to any great extent. The Puget Sound Iron Co.'s furnace at Port Townsend has been the only furnace on the coast in blast during the year, and that only for a short time. This company intends putting this furnace in blast again about March or April next.

There is talk also of developing the iron in the mountain at Dagget, San Bernardino county. A company has been formed to open the mine, build furnaces, rolling-mills, etc. Thus far the project is only on paper, as far as we are informed, but there is so much enterprise now being shown by the people of the southern part of the State that the plan may be carried out in all its magnitude.

C. F. McGLASHAN of Truckee, who has a collection of 20,000 butterflies and moths, has applied for a patent for preserving and exhibiting entomological specimens. It consists of hermetically sealed glass cases, in which the insects are pinned to small pieces of cork cemented to the glass. It is claimed that the invention will popularize entomology.

## The Corner in Copper.

The copper miners of California, Arizona and Montana can congratulate themselves that the French syndicate succeeded in effecting the corner in copper, though consumers of the metal will naturally take another view of the matter. Copper was for so long a time depressed in price that many mines were compelled to close down, failing to make any profit. This was notably the case with some of the Arizona mines, which, though having advantages of good ore, and plenty of it, easy to work, had the disadvantage of long distance from market and high freight. In California also the production was restricted. Some of the Montana copper mines made very little money, notwithstanding their immense resources. When, however, the price began to go up, producing mines increased their yield, and mines that had been shut down were again started up. The copper industry has not for many years been in so good a condition.

New York advices are to the effect that a gentleman thoroughly conversant with the copper market is reported as saying that the story that an agent of the French copper ring is trying in London to induce the Spanish copper companies to keep down the output of copper for four years is probably true. Some time ago a syndicate tried to form a combination of the Rio Tinto, Mason & Barry and Harries companies to limit the production of copper. It was unsuccessful. The Anaconda people were willing to go in, but the Calumet and Hecla would not. The fire in the Calumet and Hecla mine has so diminished its output that the Anaconda people are said to be willing to join the combination with the three great Spanish mines and help keep down production during the next two or three years. It is known that the latter are ready and will be satisfied if the Anaconda joins them.

## The Marshall Monument.

The Marshall Monument Committee, after a long delay, have at last got to work. Placerville Parlor of the Native Sons of the Golden West purchased the land, so there is now a place on which to erect the monument to the discoverer of gold in California. The statement is made that the sister of the man to whom the monument is to be erected had to be paid for the land on which it is to be placed, she having come into possession as his heir. If this is a fact it is a most remarkable instance of meanness. It is the desire of the commissioners to spend the entire Legislative appropriation of \$5000 on the monument alone. It is to be made of stone from a quarry near the spot. The commissioners invite stone-cutters, granite workers and monument builders to send in plans and specifications for a monument, the cost of which must not exceed \$5000.

The \$5000 remains intact, and will so remain until it is paid out to the individual who erects the monument. Plans and specifications should be addressed to the secretary, J. H. Miller, care of the Record-Union office, Sacramento. They will be received up to and including January 21st.

WOODBURN'S SILVER-COINAGE BILL.—Congressman Woodburn of Nevada has introduced a bill amending the Act of 1875 and authorizing the Secretary of the Treasury to coin 4,000,000 silver dollars per month, instead of 2,000,000, as at present. He says the volume of the circulating medium does not keep pace with the increase of population, and the necessity for more money is well understood by a sufficient number of Representatives to enable the bill to secure a majority of votes. He is the more certain of this inasmuch as the bill of last winter favoring absolute free coinage was only defeated by 35 votes.

THERE are four great accumulated masses of gold in the world—\$282,000,000 in the United States treasury, \$237,000,000 in the National bank of France, \$107,000,000 in the National bank of Germany, and \$100,000,000 in the Bank of England.

AT San Bernardino there has been incorporated a company representing \$2,000,000 capital, which proposes to erect at Chino smelters adapted to the successful reduction of all metallic ores produced in San Bernardino county.

Production of Precious Metals.

John J. Valentines, vice president and general manager Wells, Fargo & Co., has kindly furnished us with the following statement of precious metals produced in 1887 :

The following is a copy of our annual statement of precious metals produced in the States and Territories west of the Missouri river (including British Columbia and receipts by express from the West Coast States of Mexico) during 1887, which shows aggregate products as follows : Gold, \$33,074,022; silver, \$51,578,118; copper, \$10,362,746; lead, \$9,631,073; total gross result, \$104,645,959.

As stated repeatedly, the facilities afforded for the transportation of bullion, ores and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities. Especially is this the case in the reports from Colorado and Montana. The general tendency is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result, as shown herein, we think may be relied on with reasonable confidence as approximately correct.

Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-1887.

Year.	Product as per W. F. & Co.'s statement, including British Columbia and west coast of Mexico.	Product after deducting amount from British Columbia and west coast of Mexico.
1870	\$24,000,000	\$22,150,000
1871	68,251,000	65,751,000
1872	11,250,000	10,000,000
1873	72,258,000	70,750,000
1874	74,400,000	71,400,000
1875	82,880,000	79,700,000
1876	90,875,000	87,200,000
1877	88,421,754	85,811,582
1878	81,134,622	78,276,107
1879	53,491,001	51,853,888
1880	84,300,000	82,000,000
1881	84,300,000	82,000,000
1882	92,411,885	89,207,549
1883	90,818,612	88,630,312
1884	84,975,054	81,693,585
1885	103,151,299	100,109,222
1886	104,645,959	103,357,170

444,907. Total, \$43,006,618, as against \$44,034,590 last year. Pounds sterling estimated at \$4.84.

Mr. Valentine also furnishes a statement of the product of gold and silver in the Republic of Mexico from 1877 to 1887, the aggregates for the period being as follows:

Gold.....	\$ 9,613,000
Silver.....	293,527,000
Total.....	\$308,045,000

The coinage of the republic from July 1, 1873, to June 30, 1887, was as follows:

Gold.....	\$ 8,945,749
Silver.....	323,883,608
Copper.....	203,296
Total.....	\$332,132,653

There is also the following interesting exhibit by epochs of the coinage of Mexico from the establishment of the mints in 1537 to the end of the fiscal year of 1887:

Colonial Epoch.	Totals.
Unmilled coin from 1537 to 1731.....	\$760,765,406
Pillar coin, 1732 to 1771.....	461,618,225
Bust coin, 1772 to 1821.....	939,298,329

Grand total.....\$2,151,581,000

The above total comprises \$68,778,411 in gold, \$2,082,260,656 in silver, and \$542,893 in copper.

Independence.	Totals.
Iturbide's Imperial bust, from 1822-3.....	\$19,132,061
Republic eagle, 1824 to June 30, 1873.....	790,622,290

Grand total.....\$809,655,251

During this period the gold coinage was \$45,598,020; silver, \$758,822,054; and copper, \$5,235,177.

Republic.	Total.
Eagle coin, from July 1, 1873, to June 30, 1887.....	\$332,132,653

SUMMARY.

Colonial Epoch—From 1537 to 1821, \$2,151,

THE DODGE IMPROVED PULVERIZER.

\$81.60; Independence, from 1822 to 1873, \$809,655,251; Republic, from 1873 to 1887, \$332,132,653. Total, \$3,293,369,864.

The exhibits of production and mintage indicate a steady development of the mining interests of the United States of America, and also of Mexico, and with the increasing facilities of railway communication fostering every department of industry, the outlook for a continued growth in the product of precious metals is flattering.

RAE'S ELECTRIC SYSTEM.—Dr. J. H. Rae writes us from Virginia, Nev., that they started the electric system at 10 A. M. last Saturday in Mackay's pan-mills, and it is operating satisfactorily. They think they can see an improvement in the settlers, but will not be positive concerning the amount saved until the cleanup on the lot prox. The system is working to Dr. Rae's entire satisfaction.

DURING last week 950 tons of ore were shipped by the Cons. California and Virginia mine to the Morgan mill, 1342 tons to the Eureka mill, and 1100 tons to the California mill. The assay value of all the ore worked at the above mills during the week, according to battery samples, was \$34 70. Over \$130,000 in bullion is on hand and \$77,393 was shipped.

THE product of the Gypsum mine in Northern California, which was recently sold to an English syndicate for \$150,000, will be transported by rail over 200 miles to Benicia, where extensive calcining works are to be built.

ALL the mortgages on property in San Francisco aggregated but \$1 in ten of the total value of property. No other city in the Union makes a better showing.

The Lick Observatory Astronomers.

The Board of Regents of the University of California met on Tuesday last. The special committee appointed to consider the resolution accepting the resignation of Edward S. Holden as president of the University and resolutions appointing the director of and the astronomers in the Lick Observatory, and resolutions appointing a secretary and librarian and also a machinist, a laborer and a janitor, reported through A. L. Rhodes.

The resolutions were taken up seriatim and adopted after considerable discussion and many amendments. The resolutions, as adopted, are as follows:

That the resignation of Edward S. Holden as president of the University be accepted.

That Edward S. Holden be, and he hereby is, appointed as director and astronomer of the Lick Observatory, subject to the control of the Board of Regents.

That S. W. Burnham, A. M., he, and he hereby is, appointed as astronomer, with a salary of \$3000 per annum. That J. M. Schaeherle, A. M., he, and hereby is, appointed astronomer with a salary of \$2000 per annum.

That J. E. Kessler, A. B., he, and he hereby is, appointed astronomer with a salary of \$1400 per annum.

That E. E. Barnard be appointed astronomer at \$1200 per annum.

That the following be appointed: John McDonald, machinist, \$700 per annum; Chris McGuire, laborer, \$720, and Charles Harcourt, janitor, \$720.

That a secretary and librarian be appointed. That a committee of three Regents be ap-

The Dodge Improved Pulverizer.

The engraving on this page represents the improved form of the Dodge ore pulverizer, with rock-breaker, Challengers ore-feeder, etc. The changes suggested by experience have been made in this mill since it was first used by its inventor.

The principle of this mill is that of a hexagonal drum or barrel as shown, into which the ore is fed at J through the ore-feeder after having passed through the rock-breaker. This barrel is lined inside with steel bars, G, which form a grating through which the crushed ore passes on to the screens, the fine ore passing through on to copper plates if crushing wet, or into an elevator if crushing dry, while the coarser particles return to the barrel for further grinding. The barrel being hexagonal in shape, the ore does not slide in mass as in cylindrical pulverizers but falls over at each angle, thus insuring effective crushing. Common white pig iron, broken into pieces about 10 inches long, is used for crushing, or large pieces of hard quartz may be used for this purpose.

Two sizes of this mill are made. The No. 1 machine is 4 feet diameter and 4 feet long, requires 12-horse power to drive it, and has a capacity of 25 tons in 24 hours through a 40-mesh screen. This machine has a screen surface of 31 square feet; tight and loose pulleys, 30-inch diameter, 8-inch face, making 155 revolutions per minute, which gives 25 revolutions per minute on the mill; weight, about 18,000 pounds. The No. 2 machine is 3 feet diameter and 3 feet long, requires 8-horse power to drive it, and has a capacity of 10 tons in 24 hours through a 40-mesh screen. This machine has a screen surface of 17½ square feet; tight and loose pulleys, 20-inch diameter, 8-inch face, making 160 revolutions per minute, which gives 32 revolutions per minute on the mill; weight, about 8000 pounds. As will be seen, a Challenge ore-feeder on a special frame has over it a rock-breaker with a hopper, so that when ore is dumped into the hopper it is broken and properly fed to the mill. Under the mill is a dust-bin, H, for use when crushing dry. These machines are now built by Parke & Lacy of this city.

Foundry Notes.

The new hoisting works for a coal mine in Washington Territory, which are being built at the Golden State and Miners' Iron Works, in this city, are nearly completed. They will be about as large as any ever made on this coast. The engines are very powerful, and the whole machinery is of the greatest strength and perfection.

The Fulton Iron Works now have in their shops some 12 marine engines for use in coasting vessels. The auxiliary steam schooners built here of late have been profitable, making quick passages at small expense. So great has been their success that others are being built. The Fulton Works have made most of the engines.

Irving M. Scott of the Union Iron Works says with regard to the new Cruiser No. 5 that all the contracts have been executed. He says: "I have bought a lot of material for her—in fact all that we shall need in her construction, of all classes and kinds. I bought the hull plates from Andrew Carnegie of Pittsburgh, the shafts from the Bethlehem Steel Co.'s shop, and the steel casts from the Pacific Rolling-Mills, and as soon as the various plates reach here, the business of laying them will begin.

Fletcher Wilson, engineer in charge of Cruiser No. 5, was sent out by Secretary Whitney to inspect the machinery, and he will be here two years. The hull will be inspected by F. L. Fernold, who is already here, and the steel for the new cruiser will be inspected by Lieutenant Gilmore. It will probably take two years to finish the vessel.

"Secretary Whitney I found to be a good business man, intelligent, fair and just in his decisions, and anxious to give to the United States a navy equal to any. He is a strong friend of California, and believes in the future of the Pacific Coast and the whole country.

"We will rush the work through on the new cruiser just as fast as possible, employing a large force of men."

There is said to be a big demand for South Riverside coal.

The gross yield for 1887, shown above, segregated, is approximately as follows:

	Per cent.	Amount
Gold.....	31.61	\$32,074,022
Silver.....	49.23	51,578,118
Copper.....	9.91	10,362,746
Lead.....	9.20	9,631,073
Total.....		\$104,645,959

The exports of silver during the past year to Japan, China, the Straits, etc., have been as follows: From London, \$23,861,805; from Marseilles, \$4,699,906; from San Francisco, \$14,

## MECHANICAL PROGRESS.

## The Improvements in Machine Tools.

During a recent inspection of a modern machine shop, I was deeply impressed by the radical changes and improvements in the machinery and the methods of to-day as compared with those used in the shops 20 or more years ago. The progress in the system, organization and processes of manufacturing machinery has no doubt been as rapid as in any other branch of industry. And why not? To the mechanic, especially to the machinist and milling engineer, largely belongs the duty of inventing and developing the improvements of all classes of machinery, and surely they would not be consistent if they neglected those machines with which they come in daily contact and which are used in the production of all other machinery for every purpose. It has been said that lathes, planers and drills have not been changed or improved much in the last 20 years. They who make such statements have evidently not been close students or they did not have to do with the machine tools of the earlier days.

About 22 years ago I started my apprenticeship in the largest and best machine shop in a city of 60,000 inhabitants, and I well remember this class of tools I served my time with; lathes of all descriptions with wood frames, light iron ways, chain feeds, cast-iron headstock and tailstock, spindles of small diameter, fine pitch, narrow face, back gears, narrow-held cones, skeleton tool posts and such. There were a few lathes in the shop built of "all iron and steel" that were not much better than their wood-frame neighbors, either in appearance, strength, utility, or accuracy of workmanship and production. Still fewer lathes we had that would cut threads, and none that would cut a large square-thread cider press screw and nut that agreed.

As for planers, they were not much better. There was one planer about 28 inches wide by 10 feet long, the first one ever used in this city, and I guess it weighed about 4000 pounds. It would plane every way except parallel, straight and square. The crank planer was on a par with the times when it was made, and might have had power to take a respectable cut on metal. If it had, no one ever demonstrated the fact. One large drill-press had its table drilled off and a substitute was made from a portion of a heavy oak plank, which warped to a beautiful dish pattern when this big cylinder stove was first fired up in the cold weather. Its spindle would drop nearly one-half an inch when going through the hole, and as a matter of course the blacksmith was kept busy redressing flat drills. Another small drill-press was built to set on the ordinary machinist bench, but "the powers that were" set it up on a pair of (saw) horses in the middle of the floor to make it more accessible for work and other things. They succeeded beyond their most sanguine hopes, for it was the most accessible tool I ever saw for anything but work. The horses served for every large casting to be set up and braced against. Castings large and small were thrown under them. Old broken castings, scrap iron, pieces of so-called drills, chips, waste and all other kinds of dirt common to the general jobbing machine-shop found shelter under and around the protecting wings or legs of this drill-press. Some readers may think this an exaggerated description, but I can assure them that I was considered fortunate in securing an opportunity of learning my trade in the best-equipped shop in town, and there were several of them.

The same general brief description of machine tools will also serve for a large majority of shops throughout the country at that period. Now all these things are changed, and such scenes as described are rare—in fact in the minority. Lathes are common that will cut accurate threads of all shapes, sizes and leads, except fractional threads. They will bore straight, true holes, and turn true cylindrical work. They have plenty of "all iron and steel" in their construction, and are well proportioned with large, stiff steel spindles, strong back gears and generous cone belts. They show large ways for the carriage to travel on. The carriages have ample bearing surfaces. Lead screws are larger, stronger, and, as a rule, coarser in pitch. Reverse or frog-gearing is stronger and better arranged.

Planers have been subjected to the same improving process as well as drill-presses and other machines. In addition to all this they have been improved by having new features added to them for the convenience of operators, as well as for facilitating and perfecting work. But it is in the field of special tools and appliances for the rapid production of better work that the machinist's plant has been most improved, and to which I at the outset intended to confine myself most particularly; but it would take more than one article to tell these things, even in a brief manner. One of the most trying jobs that the machinist of "ye olden time" had to do was to bore out holes with the ordinary hook tool. They had to be bored through short hubs, through long hubs, through hard and soft hubs, through habbit, brass, cast and wrought iron, and still they had to be bored large and small, have heavy cuts and light cuts, and in and through all kinds of cased holes chuck full of sand fresh from the foundry. Generally there are about six hook-headed tools in the shop, and five men were

using the best of them as each came to select them in his turn.

Old-fashioned boring machines were not built right for good results, and an honest every-day mechanic could not possibly produce a fair day's work under such conditions, and it made him tired of the old, shaky lathe, wooden crossbar chuck and slender boring tool.

All these things are changed now for those who want to have them changed. Nice new chucking machines, both horizontal and upright, can be had now with good chucks, self-feeds and turret, with four or more bores for cutters and reamers to bore and finish holes and even face hubs without taking out or changing a hole. They will make thousands of holes alike and will probably produce more work in one day with a smart boy than the old method aided by a good mechanic would in a week. One machine of this class would keep the whole force of an average shop of 50 men busy finishing up what is outside of the holes they bore. They cost less for tools, attendance and operation than the three or four lathes used for the same work. They cost less for tools which last infinitely longer, take less room and save the cost of the three men on the lathes. There are shops that think, whether rightly or wrongly, that their business or capacity would not warrant such an investment, and they would naturally prefer to have something better than the ordinary boring tool.—*Cor. Dominion Mechanic.*

## Mechanical Suggestions.

To build a machine too well is to build it ill. He who should make a mowing machine in which the class of workmanship and the character of the finish was that found on a high-class machine tool, would score not only a commercial but a practical failure.

Free fits and no fits at all are the salvation of many machines.

It may be accepted as axiomatic that if a machine is to go into rough hands, it must be a rough machine; and the refinement possible in workmanship is exactly proportionate to the mechanical knowledge and skill of those who are to use it.

When there is any doubt as to the character of the workmanship in any particular case, it is better to err in the direction of over-refinement.

Use that which best accomplishes your purpose, even if some pronounce it "unmechanical," for that is the best in mechanism which accomplishes a given result in the most direct and effective manner.

Methods are of little consequence, except as means of reaching an end, and the value of a result as a result is independent of the method by which it is obtained.

The expressions "mechanical" and "unmechanical," as usually applied, have reference simply to the correspondence or non-correspondence of the method or device in question with our preconceived notions of fitness— notions usually based on prejudice, the outgrowth of ignorance and custom.

**COMPARATIVE MOTIVE FORCE OF DIFFERENT NATIONALITIES.**—From a note published by the Bureau of Statistics in Berlin the following very interesting figures are taken: Four-fifths of the engines now working in the world have been constructed during the last 25 years. The force equivalent to the working steam engines represents in the United States 7,500,000-horse power, in England 7,000,000-horse power, in Germany 4,500,000, in France 3,000,000, in Austria, 1,500,000. In these the motive-power of the locomotives is not included, whose number in all the world amounts to 105,000, and represents a total of 3,000,000-horse power. Adding this amount to the other figures, we obtain the total of 46,000,000-horse power. France has 49,590 stationary and locomotive boilers, 7000 locomotives. Germany has 59,000 boilers, 10,000 locomotives; Austria 12,000 boilers and 2800 locomotives. The steam engines to-day represent in the world approximately the work of a thousand millions of men, or more than double the working population of the earth. Steam, therefore, has trebled man's working power, enabling him to economize his physical strength while attending to his intellectual development.

**THE FIRST AMERICAN EDGE TOOLS.**—The first American establishment for the exclusive manufacture of edged tools was founded by Samuel Collins, at Collinsville, Conn., about 1826, when the product of a day's labor was the forging and tempering of eight broadaxes. With the modern appliances for such work, many times that number can be turned out in a day.

**THE METALS OF THE ANCIENTS.**—The ancients were acquainted with seven metals which they exposed to possess certain mystic relationship with the planets, and were represented by the hieroglyphics by which the planets were known. Gold was called Sol or sun; silver, Luna or moon; iron, Mars; lead, Saturn; copper, Venus; tin, Jupiter; mercury, Mercury.

**THE REASON WHY.**—An exchange says that a reason why steel will not weld as readily as wrought iron is that it is not partially composed of cinder, as seems to be the case with wrought iron, which assists in forming a fusible alloy with the scale of oxidation formed on the surface of the iron in the furnace.

## SCIENTIFIC PROGRESS.

## Philosophy of the Use of Oil on Rough Seas.

The stilling of waves by the use of oil was known to the ancients, is mentioned by Pliny, Plutarch and Aristotle, and allusion is made to it in the Scriptures. If there had been no potency in pouring oil on troubled waters, it is hardly probable that the saying would have become so well known, and been handed down from generation to generation.

The smooth sea or "alick" (to use a sailor phrase) always to the leeward of a dead whale, is vouched for by captains and whalers.

Question any old whaler and he will tell you it is a common occurrence, after fastening to a whale, for the elick caused by the oil from the whale to smooth the waves; while he knows the fact, he cannot give a lucid explanation of the reason of this tranquillizing effect of the oil on rough water.

The following theory has been put forward by one who has studied this matter quite thoroughly, and is worthy of attention: If a drop of oil is put on a highly polished marble table, or large plate glass that lies horizontally, the drop remains in place; spreads very little. But when put on water, it spreads instantly many feet around, becoming so thin as to produce the prismatic colors for a considerable space, and beyond them so much thinner as to be invisible.

It seems as if a natural repulsion between its particles took place as soon as it touched the water, and a repulsion so strong as to act upon other bodies swimming on the surface, as straw, leaves, chips, etc., forcing them to recede every way from the drop, as from a center, leaving a large clear space. There seems to be no repulsion between water and air to keep them from coming in contact with each other.

Air in motion or wind in passing over the smooth surface of water may rub it, as it were, upon the surface, and raise it in wrinkles, which, if the wind continues, are the elements of future waves.

If there be a mutual repulsion between the particles of oil, and no attraction between oil and water, oil dropped on water will not be held together; it will be at liberty to expand itself. The wind blowing over the water thus covered by a film of oil cannot easily catch upon it so as to raise the first wrinkles, but slides over it and leaves it smooth. It moves the oil a little, which, being between it and the water, seems to slide with and prevent friction.

When the wind blows fresh, there are continually rising on the back of every great wave a number of smaller ones, which roughen its surface and give the wind hold, as it were, to push it with greater force.

This hold is diminished by preventing the production of these smaller waves, and possibly, too, when a wave's surface is oiled, the wind in passing over it may rather in some degree press it down, and contribute to prevent its rising again, instead of promoting it.

This investigator's theory, to say the least, is a plausible one, and we feel bound to accept it till some one propounds a better one. The following suggestions are from the reports of the Hydrographic office, pamphlet 83:

A comparatively small amount of oil, say two quarts per hour, properly used, is sufficient to prevent any great damage to vessels and small boats in heavy seas. The greatest effect from oil is obtained in deep water.

In order to get the best effect from oil, it must be applied in such a way as to spread to the windward.

It is effective when scudding, when lying-to, when wearing, when lowering and hoisting boats in heavy seas. The best results seemed to be secured by pouring it into the bowls of water-closets where oakum has been placed, when it slowly leaks out.

It recommends in running before the wind, that canvas bags, capacity of two gallons, stuffed with oakum saturated with oil, be suspended by lanyards from each cat-head, and allowed to dangle in the water. In lying to, the weather-bow and mizzen-chains seem to be the best places for the bag, with lines long enough to allow them to tend to the windward while the ship drifts.

In crossing a bar on a flood-tide, some oil should be put overboard and allowed to float in ahead of the boat, which should follow with an oil-bag astern.

In crossing a bar on ebb-tide no advantage can be obtained by the use of oil. For hoarding a wreck, a vessel should run as close as possible under the lee of the wreck and put oil over. The wreck will drift down into the oil, when a boat can be sent alongside of her favorably. In case of a boat riding to a sea-anchor in heavy weather, the oil-bag should be secured to an endless line drove through a block at the sea-anchor, by means of which the oil is spread ahead of the boat, and when the bag is empty it can be hauled aboard and replenished.

These directions have been gathered from the experiences of those who have experimented with oil in high seas. S.

## Kite-Flying as a Science.

Among the boys of this country, the only object seems to be to get the kite into the air and enjoy the monotony of holding the string. They fly kites very different and for very different purposes in China and in India generally. There, boys, as well as men, spend the day in, as they manage it, a most exciting sport. An East Indian boy would laugh at the idea of flying a kite merely to see it in the air. A writer who has witnessed the sport describes the manufacture of the kite, and the manner of using it, as follows:

At the proper season, they go out for a day's sport, and fight kites in a way that would enrapture an American youth. They make a kite out of two sticks, one a straight, the other a bow-shaped piece of smooth wood, to which a common piece of paper is pasted. The tail is small, about in proportion and shaped like the tail of a bird. The string is carefully prepared by coating it with a paste made of varnish and finely powdered glass. It is then attached to the face of the kite, according to the angle at which it is desired to have it stand in the air. There is no running necessary to get the kite into the air, for it is set up by a series of jerks at the string. When as high as desired, the manipulator, by carefully jerking the string by which the kite executes a series of curves, moves it away from the direct force of the wind, and can in a circle of 360 degrees bring it 120 degrees to the right or left. Thus, by the position the kite has in the air, it is difficult to locate the place where the manipulator stands.

Now for the object of the glazed string. When there are several kites in the air, it is the desire of each manipulator to cut the strings of the others. He tries first to get his kite higher than that of his opponent, then to move it to the right or left to cross the other's string. When this has been accomplished he rewinds his string at a rapid rate. His kite turns round like a wheel and descends. His string, falling upon that of the other kite, cuts it like a saw. I have seen one of these East Indian kites put into this air so as to stand directly overhead, parallel with the earth.

## The Action of Magnets on Liquids.

Mr. S. T. Morehead of Lee University, Lexington, Va., in a communication to the *Journal of Science*, says: "Some weeks ago one of my students, Mr. J. C. Child, and myself were working with a diamagnetic instrument, repeating well-known experiments. Plank's method of observing the diamagnetism of liquids having failed in our hands to give satisfactory results, we hit upon a method which was new to us and which was very satisfactory. Into a glass tube of about four or five millimeters internal diameter, a small quantity of liquid was introduced forming a short cylinder. This tube was placed horizontally at right angles to the line joining the poles of the magnet, with the liquid nearly between the poles. When the current was turned on, the liquid was very evidently repelled. Water was repelled through a distance of about half a centimeter; wood spirit, through a greater distance. By moving the tube in the direction of its length, the wood spirit could be pushed any distance through the tube. The amount of motion is, of course, a function of the resistances due to adhesion and friction as well as of the repulsive force. The attraction of liquids is easily shown by the same method.

"A single modification of this above plan of proceeding is to incline the tube slightly so as to make the liquid flow toward the poles. If the required velocity be not too great, the magnet acts as a brake to stop the motion. It is well to bend the tube up a little at each end to prevent the liquids from flowing out. This method is well adapted for projection so as to be seen by large audiences."

**SPECIFIC HEAT.**—The specific heat of any substance is a term used to express the quantity of heat required to raise one pound of the substance one degree in temperature. Water has the greatest amount of specific heat of any substance, and is taken as the unit by which all other substances are measured. Thus a table of specific heat will give water, 1.00; cast iron, 0.14; wrought iron, 0.11; lead, 0.03, etc., which means that the quantity of heat that is required to raise one pound of water one degree in temperature would raise eleven pounds of cast iron or nine pounds of wrought iron, or 33 pounds of lead the same amount. The specific heat of substances is not exactly the same at all temperatures, but rises slightly as the temperature increases. The measure is taken from distilled water raised from 39° to 40°. This quantity is denominated a unit of heat.

**THE OLDEST BOTANICAL WORK.**—The great temple of Karnak at Thebes, in Egypt, contains the oldest botanical work in the world. It is sculptured on the walls of the temple, and represents foreign plants brought home by Thotmea III, from a campaign in Arabia. Not only is the plant or tree shown, but the leaves, fruit, and seed-pods are illustrated separately, after the fashion of modern botanists.

SAVANTS have discovered that the hair of the prong-horned antelope, like that of man, is made to stand erect by sudden fright. Investigation in this line might take in the hedgehog and ridge-pole cat.

## ENGINEERING NOTES.

## Great Ditching Scheme in Illinois.

There has heretofore been a marsh of some 200,000 acres in extent on the west side of Mason county, Illinois, which lies along the Illinois river, that stream making the western boundary. This marsh, since the settlement of the State, has been great duck and other game hunting-ground, though considerable of a nuisance to the farmers living on its borders. This marsh has recently been drained by the Mason County Ditch Co., consisting of the farmers owning the adjoining lands and the outside proprietors of the marshlands. The main ditch is 60 feet wide at top, 40 feet at bottom and 8 feet deep. It is 15 miles long, has a fall of 4 feet to the mile, and drains with its laterals, which are 30 feet wide at top, 15 at bottom, and with a depth to correspond with the main, from 200,000 to 300,000 acres. The cost of the whole is estimated to be \$200,000. The earth removed is sand and clay mixed, and offers little resistance to the machinery. The dredge doing the work floats in the water of the ditch and makes 100 feet progress every day. The assessed cost on some of the drained land will ultimately amount to \$25 per acre, and thence grading down to a trivial sum.

The work has been in progress for several years, and meantime the land drained has produced surprising crops of wheat and corn. The past year—a year of severe drouth—matters have not progressed as favorably in respect to crops, thousands of acres of corn having been lost by “firing” in consequence of the sudden withdrawal of the usual moisture. The thoughtful among the projectors of the scheme and owners of the land are now aware that they have made a mistake in not providing for holding a portion of the water, and recognize the fact that the ditch is twice the dimensions it should have been. If it were not for the fall—4 feet to the mile—a few locks or dams would hold the water when it will be needed for crops; but now it will take many.

THE GREAT GERMAN CANAL, which is to connect the North sea with the Baltic, the work of which was inaugurated with great ceremony in June last, is not a mere individual enterprise. It is a State undertaking, for strategic purposes. It will be also the realization of a very old project which was first proposed more than 500 years ago. The canal itself, which will be a clear cut from sea to sea, will have locks at both ends, with tide-gates to insure communication at any hour and under any condition of tides or temporary currents. In addition to its value for naval purposes, it will likewise prove of immense commercial advantage. At the point decided on for work, the Danish isthmus is 61 miles across, and the canal will save a circuit of nearly 600 miles. English commerce out of Hull, or out of places to the north of that port, will gain little from this canal, but the trade going to the Baltic by way of London or the south of England will save 240 miles. It is expected that tonnage to the collective amount of five and a half million tons will pass through the new canal yearly. This will mean half the tonnage now proceeding to the Baltic from English, French, German or Dutch ports. Whether these bright anticipations will be realized depends, of course, upon the practice of ship-owners when the canal is constructed. The canal will be a little over 60 yards wide and eight yards deep, which, it is claimed, will give ample room for two large mercantile vessels to pass each other, so that the delay which is now caused in the Suez canal from want of water-way will be avoided.

AN EXPENSIVE SEWAGE SYSTEM FOR SAN DIEGO.—The rapidly increasing population of San Diego calls for a thorough and extensive system of sewage. Accordingly a plan has been devised, somewhat novel in character and which will cost about \$400,000. The contract has been awarded to Col. Waring. The main sewer runs a quarter of a mile into the harbor to an outlet reservoir constructed alongside the deep-ship channels. The reservoir will have an area of one acre, and cost some \$50,000. The collected sewage will fill this reservoir not more than 1½ foot deep. High tide will add 3½ feet of sea-water to the mass. The contents thus diluted will be discharged into the outgoing tide by automatic gates opening an hour after high tide, and closing an hour before low tide. Col. Waring will also be employed to construct similar works for Stockton and Sacramento, where the conditions are nearly identical with those at San Diego. Col. Waring will make wells in various flat parts of those cities, connecting with a deep outlet well by large siphons. It is stated that Col. Waring has employed this plan for two years successfully at Norfolk, Virginia.

STARTLING FIGURES.—The water falling over Niagara has a power of 100,000 tons per hour moving through 150 feet. This force is equal to the consumption of 260,000,000 tons of coal, the amount annually burned by the entire population of the world. If one-half the fuel burned is used in driving machinery, then the power of Niagara would drive all the machinery in the world, with 50 per cent to lose in transmitting.

## USEFUL INFORMATION.

## Extent of the Wood-Working Interest.

The great extent of the wood-working interest, and its intimate relations to almost all other manufacturing interests, makes the conduct of a strictly wood working journal no trivial matter. By far the largest division of the wood-working industry is that directly or indirectly comprising the building trades proper. Except in the larger cities the majority of buildings, comprising dwellings, factories, mills, barns, shops and church edifices, are still constructed of wood, and thus the great army of builders are actually wood-workers. It is estimated that the amount expended in the erection and finishing of dwellings alone, yearly, throughout the country, is nearly \$800,000,000. This amount exceeds that expended in any other branch of the wood-working industry.

A large proportion of the wood-working machinery manufactured is intended for the use of those engaged in the building trades and in the preparation of building material. It is true that under the modern division of labor the manufacture of many building materials, comprising doors, sash, blinds, moldings, etc., has come to be an almost distinct industry, yet the master-builders almost always supply themselves with regular shops, fitted up with the most approved wood-working machinery for planing and matching their flooring, making their frames and casings for doors, windows, etc., and are, in fact, actual wood-workers, almost as much so as the manufacturers of sash, doors and blinds. They use much of the same machinery, and thus form the connecting link between the great building trades and the exclusive wood-workers, and requiring recognition of those trades in the hands of the intelligent and comprehensive wood-workers' journal.

Agricultural implement manufacturers, carriage and wagon manufacturers, bridge-builders, and many others, are also wood-workers, and require a variety of good working machinery, though the modern division of labor is every year taking more of the direct wood-working out of their hands. We have large establishments devoted to the exclusive manufacture of average and wagon wood-work, hubs, spokes, wheels, carriage bodies, handles, etc.; still there are a few carriage, wagon or agricultural implement factories that are not supplied with ample wood-working machinery. Railway and street-car works comprise another class of manufacturers who, though not classed as direct wood-workers, have to be supplied with ample and most improved wood-working machinery. Thus these industries are brought within the scope of the wood-working industry.

Furniture manufacturers are about the only exclusive wood-workers. They do not provide the material for other manufacturers, but complete their goods ready for the consumer. They require the most varied and perfect wood-working machinery, and much of the ingenuity of inventors, designers, and manufacturers of such machinery has been devoted to the requirements of furniture manufacturers. The ornamentation of furniture of the present day is carried to a greater extent than ever before, and has called for the manufacture of some of the most ingenious and elaborate machinery. And this demand for furniture ornamentation has given rise to a new branch of the wood-working industry, devoted exclusively to the manufacture of ornaments, which are furnished in a multitude of designs ready made, to the hand of the furniture-maker.

It will thus be seen that the scope of the wood-working industry is co-extensive with a very large number of important and far-reaching industries, and embraces by far the larger portion of mechanical occupations of the day. Indeed, it may be said to extend from the sawmill that cuts the rough lumber, from the log, to the shop that turns out the most delicate and elaborate ornaments for beautifying the most costly furniture; but it goes back of the sawmill to the axe that fells the trees in the forest, for that depends upon the wood-working establishment that manufactures the handle or helve. —The Woodworker.

THE SOUTHERN GUM TREE, says an exchange, has been experimented with in the matter of drying, and studied more than any other kind of wood, and out of many we have never had but one sample that stood the test. Samples of ordinary air-dried gum lumber that knoweth not how to warp have been promised, but they have not come to light. There is a way, practiced by a few, of sawing lumber thick to start with, and when dry, resawing it; but this is a roundabout way of getting at the desired results, although the one who does it thinks it pays. The sample to which we referred, that acted like a “white man,” was dried by the Noyes process. It has now been lying around for several months, but it is as plumb as the day it was brought into the office.

A DOMESTICATED BUFFALO HERD.—William Corbin of Weatherford, Texas, recently furnished the following interesting information to a newspaper reporter: “A sale recently took place on the border-line between Texas and New Mexico, which was remarkable for the fact that it carried with it the last remnant of the great southern buffalo herd. A ranchman, whose name I cannot recall, had on his range

200 head, which he had carefully preserved and guarded in every way. They have increased in numbers, and there are probably 300 now. He recently sold out and they have passed into other hands. It is hoped that the present owner will pursue the same course as the former, as, with the exception of a small herd in the far north, the buffalo on this range are the only ones outside the zoological gardens. It would be more profitable than raising cattle, and for this reason I believe this remnant will be shielded from destruction.”

IRON BRICKS.—Louis Jochim of Ottweiler, near Saarbrücken, Germany, is introducing paving blocks which he calls “iron bricks.” They are made by mixing equal parts of finely ground red argillaceous slate and finely ground clay and adding five per cent of iron ore. This mixture is moistened with a solution of 25 per cent of sulphate of iron, to which fine iron ore is added until it shows a consistency of 38° Balmé. It is then shaped in a press, dried, dipped once more in a nearly concentrated solution of finely ground iron ore, and then baked in an oven for 48 hours in a reducing flame. It is said that the German Government Testing Laboratory has reported favorably in regard to this new paving material.

PAPER WINDOW GLASS is one of the newest inventions. A window-pane is made of white paper, cloth or linen, and modified by chemical action. Afterward the paper is dipped in a preparation of camphor and alcohol which makes it like parchment. From this point it can be molded and cut into remarkably tough sheets, entirely translucent, and it can be dyed with almost the whole of the aniline colors, the result being a translucent sheet, showing far more vivid hues than the best glass exhibits.

MORTAR CONTAINING SUGAR has been employed in building the new Natural History Museum in Berlin, and has proved far superior to common mortar. It sets almost with the firmness of a good cement, while mortar made with molasses became soft and brittle after a time. In Madras, a mortar is used with which either sugar, butter or buttermilk, shellac and eggs are mixed. It holds well and takes a marble-like polish.

TIMING HORSES BY MEANS OF PHOTOGRAPHY.—A shrewd Yankee has invented an apparatus for timing horses. A clock with three hands—minute, second and quarter-second—is started by the official timer. When the winning horse touches the wire the clock is stopped by electricity. The same instant the current opens a camera, which photographs the horse and the clock face.

## GOOD HEALTH.

## Fatty Food.

A medical writer says: “The lumbermen in the Maine forests do very hard work in the intense cold and snows of winter and in the icy water in the spring. To endure the severe labor and cold, they must have food to yield a great deal of heat and strength. Beans and fat pork are staple articles of diet with them, and are used in very large quantities. The beans supply protein to make up for the wear and tear of muscle, and they, and more especially the pork, are very rich in energy to be used for warmth and work.”

“The use of oily and fatty foods in arctic regions is explained by the great potential energy of fat, a pound of which is equal to over two pounds of protein or starch. I have been greatly surprised to see, on looking into the matter, how commonly and largely the fatty kinds of meats are used by men engaged in very hard labor. Men in training for athletic contests, as oarsmen and football teams, eat large quantities of meat. I have often queried why so much fat beef is used, and especially why mutton is often recommended in preference to beef for training diet. Both the beef and mutton are rich in protein, which makes muscle. Mutton has the advantage of containing more fat along with the protein, and hence more potential energy. Perhaps this is another case in which experience has led to practice, the real grounds for which have later been explained by scientific research.”

## For Smallpox or Scarlet Fever.

One who was connected with the medical and surgical departments during the late war says: “Between the battles of Stone River and Missionary Ridge a smallpox epidemic scared more than it killed. A large hospital was established at Bridgeport, Ala., and the average number of inmates was represented by more than three figures. But the deaths were very few and the treatment quite simple. We only gave the patients plenty of ventilation by raising the sides of the large hospital tents, kept their bowels freely open, and gave them good rations of English ale, a commodity that was generously supplied by the Christian Commission of the North and Uncle Sam's Commissary Department.

“I have here also in my pocketbook a distinguished physician's recipe for the smallpox, and I know it is good, but I will give it to you with his own comments.

“This recipe has been used to my knowl-

edge in hundreds of cases, and I know it will prevent or cure smallpox, though the pittings are filling. When Jenner discovered the cowpox in England, the world of science hurled an avalanche of fame upon his head, but when the most scientific school of medicine in the world—that of Paris—published this recipe as a panacea for smallpox, it passed unheeded. It is unfailing as fate, and conquers in every instance. It is harmless when taken by a well person. It will also cure scarlet fever. Here is the recipe as I have used it and cured my children of scarlet fever; here it is as I have used it to cure smallpox:

“Sulphate of zinc, one grain; foxglove (digitalis), one grain; half a teaspoonful of sugar; mix with two teaspoonfuls of water. When thoroughly mixed, add four ounces of water. Take a spoonful every hour. Either disease will disappear in 12 hours. For a child, smaller doses, according to age. If counties would counsel their physicians to use this, there would be no need of pesthouses. If you value advice and experience, use this for that terrible disease.”

## Infants and Nicotine.

The Santa Rosa City Council, at its regular meeting January 3d, instructed the city attorney to draft an ordinance making it a misdemeanor to sell cigarettes to boys under 16 years of age, and also for boys under that age to smoke cigarettes. But such an ordinance, to be of any practical worth, should include cigars and tobacco in any form.

In reference to this matter the S. F. Chronicle observes: It is no uncommon thing nowadays to see children scarcely out of dresses puffing at a cigarette with all the nonchalance imaginable; and such cigarettes, too, as they generally are. The babies' means are so limited that they can buy nothing but the cheapest and vilest kinds of cigarettes, such as no man who knows anything about tobacco would look at, much less smoke; and with these indescribably nasty concoctions these youngsters proceed to poison themselves. The example of Santa Rosa is one that might be followed to advantage by other cities, San Francisco included. We make all sorts of health regulations; we enforce vaccination and prescribe how much air sleeping-rooms shall contain; we take care of the children's work-time, lest they be stunted and crushed before they have grown strong; we get up societies with long names to see that tiny acrobats do not turn one bandspiring too many, while at the same time we permit those same children to buy poison on every corner and to kill themselves by inches, and no one interferes. San Francisco should adopt an ordinance similar to that of Santa Rosa, and then see that it is enforced.

LITTLE THINGS THAT KILL.—At various times the newspapers have warned the public against swallowing the seeds of grapes, oranges, etc., because of the danger of such substances getting into a small intestinal bag, or cul-de-sac, called by doctors the appendix vermiciformis. This is a receptacle formed at the junction of the large and small intestines, but its use or object no physician knows. It has been thought to be a rudimentary or incomplete formation—or possibly some meaningless survival of a lost anterior type. At any rate, its existence, while presenting no apparent “reason for being,” as the French say, is, on the other hand, a positive and constant source of danger, because of the liability of its becoming the receptacle of some undigested seed or other indigestible substance. In that case it produces a state of inflammation, which, in nearly all cases, proves fatal. Fortunately, but few seeds among the great number so heedlessly swallowed seem to get into this little death-trap—although any one seems likely to lodge there. Perhaps more cases of inflammation of the bowels than the doctors suspect may be, in reality, due to this obscure and disregarded cause. One sad case which to-day produces a feeling of deep regret among thousands, and which plunges a family into overwhelming grief, occurred in this city on Saturday evening, in the lamented death of J. Robert Dwyer, the much-esteemed adjutant of the Governor's foot-guard—a man whose place that corps cannot make good. His case so baffled the physicians that an autopsy was had, and that revealed a piece of peanut shell in the appendix vermiciformis.—Hartford Times.

POISON FROM THE HUMAN TEETH.—The poison conveyed by the human teeth is one of the most annoying that a physician ever has to deal with, writes Dr. A. C. Robinson. A bitten ear or a nose is months in healing, where a more important wound inflicted by an instrument would readily yield to simple remedies. I have under my attention severe and most complicated cases of blood-poisoning, in which the patient had but slightly abraded the band in the course of a fight by striking his knuckle against the teeth of his opponent. I have known hands thus poisoned only saved from amputation by the application of all the resources of science. Tobacco or whisky, or dia-arrangement of the stomach for many other causes, may be responsible for this poisonous condition of the teeth, and I am not prepared to say that a man with good health and a clean, sweet mouth would convey this poison, but I can only speak of the frequency of this class of cases and the difficulty of attending them successfully.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**SUTTER CREEK.**—Cor. Amador Ledger, Jan. 7: The Wildman mill is running like clockwork. The mechanics had not completed their work more than a few hours when heavy rains set in, furnishing plenty of water for all purposes. The pressure at this mill is no doubt the best in the county, requiring but very little water to run the mill and hoisting works. Nearly all the ore which was on the dump has been crushed, and the miners are now extracting rock from the lower levels. I am told on good authority that the result of the mill's operations so far is quite satisfactory. The four men who leased the Lincoln mine from Mr. Stewart commenced work last Monday, and expect to have the mill running in a few days. Word has reached here that the Mahoney will positively start up in good shape in the spring.

**BUNKER HILL.**—The miners commenced work again at the Bunker Hill last Tuesday morning. The mill is running all the stamps, so that everything is in operation as before the fire. I understand that hereafter the changing-house for the men will be a separate building from the engine-house, so there will be less danger of burning all the works down should a fire take place in the changing-house. The work of taking the water out of the Talisman shaft commenced this week. There is only one shift on at present, but just as soon as everything is in good running order, two shifts will be put on and work commenced in earnest. Everything is run by water-power, taking water from the pipe that supplies the South Spring Hill mill.

**PLYMOUTH.**—The rains have made an abundance of water to start the mining and milling, so that the outlook for plenty of water this season is very good. Lamb and Wickern are opening up their claim on the Ocher lead. Lawrence Evans is running his mill on the sand that runs down from the Plymouth Con. mines.

## Calaveras.

**COPPERPOLIS.**—Cor. Angels Record, Jan. 5: I was present at the Union copper mine, and I saw a large iron bucket of copper ore raised from the bowels of the earth, the first one for about 20 years from this particular mine. About seven months ago, the owners put on a force of men to clear the mine of water, repair the machinery and buildings, and generally fit up the plant for business; and finally at the opening of this year, the first specimen of copper ore is on exhibition, and the population of this neighborhood shows a lively interest in the future of this mammoth enterprise. This same mine has produced vast results heretofore, and already it has distributed a very large sum of money for its wants. I have obtained no reliable information as to the plans of the company hereafter, but judging from the extensive preparations made so far, and considering the price of copper, it might easily be conjectured that copper will be taken out as fast as possible. As to the extent of the ore and its richness, we may probably rely upon the past history of the mine. The number of men now employed on all kinds of work may not exceed 20, but rumor has it that the taking out of ore will commence in earnest, and when this commodity is deposited under the sheds the blocks must be broken up and the best selected for reduction or smelting.

**MURPHYS.**—Cor. Calaveras Prospect, Jan. 6: Mining in its various branches only awaits a sufficient water supply to start the industry into increased activity in this and adjoining districts. McCormick, Bisber & Thomas will commence piping in their Central Hill gravel mine as soon as they can get sufficient water. They will put a big blast to break the bank to accelerate the work in piping. The Oro Plata mill started up a few days ago on better quartz than has been taken out of the mine for some time. The plates show more free gold than ever before. Good progress is made in sinking the large working shaft, from which the fine quartz is now being hoisted to the surface. The shaft is down 55 feet from the 100-foot level. Tom Goodwin is pushing developments in the Stanislaus district with dispatch. The Leffel Turbine and rock-crusher for his mill on the river is now lying in Murphys for transportation to its destination. Other mines in this vicinity show marked improvement, and their owners are encouraged by the present prospects.

## El Dorado.

**CONFIDENCE.**—Placerville Observer, Jan. 10: The Confidence Kern mine, owned by John Fesper, John Fesper, Wm. Brown, Albert Rodemark and Cline, has an incline down 250 feet, from which a tunnel has been run 100 feet in a bed of gravel 3½ feet in depth. This gravel is of the nature of cement and pays by sluice-washing process, \$2.50 per carload, which is about one-third of what it contains. For the proper working of this material, a mill is necessary.

**QUARTZ.**—The contractors at the Bonanza mine, Balic district, have struck 15 inches of quartz in five feet of soft vein matter, which is considered by mining men to be very favorable.

**LAST CHANCE.**—Thomas Botts, Andy O'Neill and Chas. M. Henson are opening up the Last Chance mine on Webber Hill. This mine yielded largely in olden times, but from the old works the lower part of the channel could not be reached. The tunnel now being driven will drain the entire channel, and good results are confidently expected.

## Fresno.

**GRUB GULCH.**—Expositor, Jan. 4: The Grub Gulch mines are 14 miles above Raymond on the turnpike road leading to the Yosemite valley. This is fast becoming a thriving town. The business establishments are doing extensive work. The Josephine Co. has just completed a 20-stamp mill which will soon commence crushing ore. The Gambetta mine is about one-half mile from the Josephine, and is running full blast. They are taking good ore out of the Red River. The Knob Hill mine has closed down for the present.

## Inyo.

**TO START THE MILL.**—Inyo Independent, Jan. 7: About 250 tons of ore is now gathered at the Riley

mill. There is also a large amount of wood and other necessary materials. Mr. Anthony intends starting up the mill immediately.

## Napa.

**QUICKSILVER SHIPMENTS.**—Calistogan, Jan. 4: During the past month the shipments of quicksilver from Calistoga have been unusually heavy, the advance in price having been an inducement for superintendents to mine their best ore and obtain as much of it as possible. The following figures show the output in flasks of the mines, as follows: Great Western mine, 147; Sulphur Bank, 203; Bradford's, 267; Napa Con. (Oat Hill), 330. The total amount is 947 flasks, or 71,972 pounds.

## Nevada.

**MINING WORK INTERRUPTED.**—Grass Valley Union, Jan. 10: Work is again interrupted in the mines of this district that use water-power for running their machinery. After repairs were made to the South Yuba canal last week, which supplies the water, the hard freezing weather came on, which greatly lessened the flow of water until there was not sufficient to drive all the machinery, and there will not be enough for several days, or until the weather has sufficiently moderated or the usual amount of water comes through the pipe lines. Yesterday, at the Idaho mine, there was only sufficient water to run the pumps—the mill being stopped and underground work suspended. At the Empire and North Star mines steam connection has been made for pumping, and milling and mining work for the present is suspended. The ice embargo is liable to be broken, however, at any hour, as word was received yesterday that 700 inches of water was coming down the canal, but it had not reached the reservoirs of the several companies as late as 4 o'clock P. M.

**MINERS AGAIN IDLE.**—Foothill Tidings, Jan. 7: But a few of the North Star miners went to work this morning, and they were obliged to return home at noon because of the failure of the water supply. The Empire and Brunswick are also short of water for hoisting purposes, and at the Idaho the supply is lacking 50 inches at this writing—3 o'clock P. M. Snow-slides along the line of the South Yuba ditch are no doubt responsible for the shortage. Should the Idaho nor receive its full measure very quickly the miners will again be laid off, as the reservoir reserve will be required to keep the pumps running, and must not be utilized to any extent for other purposes for fear of a prolonged blockade of the main ditch.

**THE UNION.**—Nevada Transcript, Jan. 6: A cleanup recently made at George A. Nibell & Co.'s Union quartz mine on Banner mountain gave most gratifying results. The owners of this mine have displayed a nerve and energy in pushing its development that justly entitles them to a rich reward, and they are now in a fair way to get it.

**WATER.**—Foothill Tidings, Jan. 10: Several mines in Nevada district have been partially filled by surface water. Contractors on the 1200-foot level of the Providence mine have been compelled to discontinue work until the water is lowered by pumping. The San Jose Drift Mining Company of Washington township has purchased of the locators the northeasterly extension of their mine. The purchase consists of 40 acres and lies between the original San Jose and the Centennial claim.

**THE GRANT.**—North San Juan Times, Jan. 6: The above mine only ran a few days during last month and the result of the run is not yet known here, but the Grant's owners feel satisfied that the cleanup will meet their most sanguine anticipation. The storm since the close of the old year has prevented travel to and from the mine. The last heard from there was on Christmas day, and then the rock was paying big.

**DIVIDEND.**—The cleanup at the Delhi in December paid a dividend of \$70,000 and left a few thousands on hand for a nest-egg. The entire cleanup approximated closely upon \$17,000. The Delhi still keeps up its reputation as being first-class.

**MINE FLOODED.**—Foothill Tidings, Jan. 5: Surface water in large quantities got into the shaft of the East Eureka mine on Sunday night or Monday. The pump was started up Monday night and by running it steadily until this afternoon "the bal was forked." This shaft is now down about 200 feet and the indications are splendid for a good ledge within a short distance.

## Placer.

**SPRING GARDEN DISTRICT.**—Cor. Placer Argus, Jan. 7: I have noticed the many reports of the mines on this "divide," but there is one section which I think has been somewhat neglected by our county press; that is the Spring Garden Mining District on the lower portion of the Forest Hill Divide. The rapidly increasing interest which is being taken in that section by enterprising and experienced mining men both here and below, would indicate that they are thoroughly convinced that the same deep channel, which is an established fact from Red Point, above Damascus, all the way down the Ridge to the May Flower and Excelsior mines, continues its course down the ridge through the Dardanelles, Mountain Tunnel, Old Centennial, Grey Eagle, Spring Garden and Blue Gravel mines, and probably has its outlet into the Middle Fork Canyon near the latter. This theory would seem to be still further strengthened by the fact that of all the shafts which have been sunk in that section, notably the Mountain Tunnel, Centennial, Grey Eagle, Spring Garden and Blue Gravel, although they have attained depths of 100 to 240 feet, not one has ever yet reached the bottom of the channel, for wherever they have sunk into the bedrock it has been found to be "pitching off," indicating greater depth. All the above mines, however, with the exception of the Grey Eagle, were under the control of men or companies, either lacking the necessary wealth, experience, or courage, and faith. But the Grey Eagle bids fair to solve the problem of the richness of the channel in that section. It is between the property known as the Spring Garden ranch and Owl creek. The company have erected suitable buildings, within sight of the Auburn and Forest Hill stage-road, and at a point which (by surface indications and shaft sunk to the "rim-rock" on either side) they conceive to be directly over the deepest part of the channel. Here they are sinking a shaft which has already attained a depth of 175 feet. The water which has been encountered in sinking and which is always considered a good indication in gravel mines, is raised to the surface by means of a fine double-cyl-

der steam pump. The dirt is at present raised by horse-power, but I hear this will soon be supplanted by a steam hoisting engine which will facilitate operations in general. The Grey Eagle is in active operation, but it is reported that a large and powerful company represented by two of our local mining men have obtained control of the Blue Gravel mine and adjacent properties and will soon begin the excavation of a large tunnel to tap all their ground. The strike in the Dardanelles has also accelerated the interest in the "lower divide," so that now there is scarcely a foot of available ground which has not been secured for mining purposes—that is, around Owl creek, Spring Garden and Paradise—and even farther down the divide where it is known that no gravel deposits exist. A great many quartz claims have been located. From this it will be observed that the lower portion of Forest Hill Divide is not only deserving of notice but that present prospects indicate a bright and prosperous future.

**PURCHASED.**—Placer Republican, Jan. 7: The Big Oak Tree mine at Colfax was purchased last month by S. D. Valentine of San Francisco, who immediately made a contract with M. C. Taylor and W. C. D. Body of Grass Valley, to put up new hoisting works and machinery. The contract amounted to \$3250, and the work is almost completed. The machinery consists of a boiler, engine, pump, etc., and the contractors will finish their work in about three weeks. It will require about four weeks more to pump out the shaft, which is 190 feet deep on the ledge and nearly full of water. When the water is out, Mr. Valentine will sink 100 feet more on the ledge before he begins to crush. It is probable that a new mill will be erected. The Big Oak Tree, the Rising Sun, and the railroad company are at present tangled up in a manner more complicated than interesting, and when the litigation is once settled and the Big Oak is got under way there is no doubt that it will prove to be a handsome property. Some of the ore has proved to be very rich.

**NEW PROJECT.**—A new mining project is under way at Todds Valley. A company consisting of John Farrier, Thomas Harper, Anthony Clark, and others have begun the work of extending the old Union Tunnel which is located two miles below the town and was originally intended to tap the main channel of Todds Valley. This tunnel was run 200 feet in early days at a cost of about \$60 a foot. The present company is driving it ahead now for the main lead, and they expect to strike the channel in about 250 feet just below the old Natchez tunnel, which paid well in early days.

## Shasta.

**NEW LEDGE.**—Shasta Free Press, Jan. 7: Gainey and some others have struck a rich and extensive ledge on Clear creek. It was discovered in the following manner: He and his party, who were out prospecting, came across two Germans, placer mining, and in conversation with them discovered that they were perfectly ignorant concerning quartz, and that during their travels they had found what they call "a streak of white-looking rock," about 100 yards up the hill from where they were working. They immediately hunted that streak and found what they consider one of the richest ledges ever discovered in that section. It was located at once, and they are now developing it. At the head of Dog Creek gulch, Bard, Hunter & Co., Trinity county men, are making some surprising developments. At Delta, Frank Klemenstein is about to enlarge his hotel by butting a 20x60 wing to it and raising the whole building another story. Alex Bergman was down from Squaw creek on Wednesday, and from him we learn that the Croesus mine had to shut down their mill in consequence of the water freezing and bursting a pipe, but that the mine was still developing richly. In the old Carson & Snyder mine, now Conant & Hendy's, they have struck a good ledge in the lower tunnel. A contract has been let by them for 130 feet, and they expect some rich developments before it is completed. A mill will be erected in the spring. The Conant mine is as good as ever, and they are still turning out their regular bullion. Considerable prospecting has been done in our vicinity during the past rainy days of this week, and within the sound of the planing-mill whistle; as much as ten cents to the pan has been washed out. Some coarse gold has also been found, and some of our mechanics have made good wages during the time the wet weather kept them from their regular work. Parties are very reticent concerning the location of their finds, as they wish to preserve them for rainy days.

## Sierra.

**TUNNEL.**—Mountain Messenger, Jan. 7: J. P. Kuder & Co. are running a tunnel ahead near Good-year Bar into a flat that has never been thoroughly prospected. The tunnel was run in early times in bedrock and was long since abandoned. Mr. Kuder's company are raising in the tunnel and he thinks the indications are favorable for a channel that has heretofore been unexplored. The Young America Co. has struck the ledge 800 feet below the present workings, with their lower tunnel. This will necessarily advance the value of their stock. F. J. Hauber has been here this week from Alleghany, and reports mining news as follows: The Rainbow Co. are operating in their mine, and run a Burleigh drill. The original tunnel was in 2000 feet, and missed the ledge. Now they have branched off at 1600 feet, to the right, and struck the Rainbow ledge, which is five feet wide and prospects well. The company are highly elated. Rich quartz was struck a few days ago in the Downieville, better known as the Old Sailor ledge, owned by Thos. Bessler. Friday morning snow was seven feet deep at the Young America quartz-mill, over 6000 feet above the sea, same altitude as Howland Flat and Lake Tahoe.

**THE ALASKA.**—North San Juan Times, Jan. 6: A workman in this mine reported here the present week that a gold vein had been struck which yielded solid pieces of gold. He said sackfuls of pieces had been taken out last week in which quartz was the exception. The Alaska is proving itself to be a wonderful mine in richness, and but for the cost of mining it would be ranked among the best-paying mines yet discovered on the Pacific Coast.

## Trinity.

**EAST FORK.**—Cor. Trinity Journal: The East Fork district now bids fair to become, in the near future, one of the principal mining districts in the county—located as it is near the center of the county,

easy of access, within a few miles of wagon-roads on either side. That a wagon-road is one of the indispensable necessities to the successful working and developing of the district is self-evident to all. East Fork to-day is of more importance to Weaverly and the central part of the county than the other three principal camps all put together. Deadwood, Bullychoop and New River are all so located that their trade, travel, money and business generally go directly the other way out of the county.

**DRIVEN OFF BY SNOW.**—Mr. F. J. Perkins, who has been prospecting the Yellowstone mine in the East Fork district for W. T. Coleman, was in town this week. Owing to the heavy fall of snow, work has been suspended on the mine till spring. The mine looks well.

## Tulare.

**NICKEL.**—Tulare Times, Jan. 4: Five months ago there was published in the Times an article descriptive of the mineral resources of Tulare county. We then predicted that in the near future discoveries would be made which would place our county in the front rank as a mining county. On the old Bacon ranch 10 miles northeast of this city, a discovery has been made recently which proves beyond a doubt that nickel exists there, we hope, in paying quantities.

## NEVADA.

## Washoe District.

**BEST AND BELCHER.**—Virginia Enterprise, Jan. 7: On the 425 level west crosscut No. 2 has been extended 15 feet; total, 289 feet. The formation is hard birdseye porphyry. East crosscut No. 3, north of the south line, has been advanced 22 feet. No work has been done in the main north drift during the week. On the 1300 level west crosscut No. 2, opposite east crosscut No. 1, has been advanced 45 feet. On the 1500 level, through the 1300 level winze connection, all movable matter has been recovered, and work has been suspended at this point.

**HALE AND NORCROSS.**—On the 400 level the west drift has been advanced 40 feet. Most of this distance is in a body of fine-looking quartz, giving fair assays. On the 700 level the ore development shows continual and steady improvement. In the north upraise they are now up seven sets vertically, all the way in fine ore. The north upraise is advanced 49 feet, the last 300 feet of which is all high-grade ore. From the top of this upraise have drifted 45 feet north in good ore and have connected with the south drift leading from the north upraise. On account of severe weather have not been able to ship the usual quantity of ore to the Vivian mill. Have bullion on hand from this mill which with previous receipts amounts to \$45,000.

**SAVAGE.**—Since last reports the north drift on the 400 level has been advanced 100 feet, and the south drift 67 feet. On the 500 level the upraise has been extended 67 feet. On the 600 level the main south drift was extended 60 feet. Have not extracted the usual quantity of ore, owing at first to the scarcity of water and since to the freezing weather and later to the interruption of communication occasioned by the recent severe storms. From present appearances we anticipate no further trouble from either of these sources. We have bullion on hand for the month amounting to \$52,000.

**BELCHER.**—West crosscut No. 2, 400 level, is now in 45 feet. The face is in porphyry, showing streaks of low-grade quartz. The 400 level south drift is in 175 feet south of the line. The face is in about the same material as reported last week. Have started south also from the 500 level south drift of the Crown Point for the purpose of upraising in Belcher ground on this level. Have advanced it 27 feet. Suture tunnel drift is out 1115 feet. A considerable portion of the week was occupied in timbering.

**CROWN POINT.**—The 500 level west crosscut is now in 117 feet. The ground in the face is composed of soft porphyry and quartz in streaks, and about 1½ inches of water is running from it. About striking the ledge for which this drift is run, the distance to go depends on the dip of the ledge, and it may be either 15 or 25 feet further off. The ground they are now cutting is identically of the same character as that cut 15 or 20 feet east of the ledge found on the 400 level.

**CON. CAL. AND VIRGINIA.**—On the 1300 level the east drift from the south drift still continues to show streaks and bunches of good ore. On the 1435 level the winze in crosscut No. 2 still shows ore of high grade. The usual amount of ore has been shipped to the Morgan and Eureka mills on the Carson river and to the California mill in this city. The average assay value of the ore shipped will be about the same as last week.

**OCCIDENTAL.**—No. 2 upraise, 74 feet north of the north incline winze, has been carried up 12 feet; total raise, 29 feet. Four tons of ore from this raise has been stored in the dump. On the 48 level have extracted 48 tons of ore. The ore extracted from the 100 and 200 levels has been held in the mine, as the dump at the lower tunnel is full.

**GOULD AND CURRY.**—On the 250 level east crosscut No. 2 has been extended 16 feet; total length, 30 feet. The formation is porphyry, clay and quartz. From the top of the upraise in the east crosscut the east drift has been extended 9 feet; total length, 37 feet. The face is in clay showing some water.

**EXCHEQUEUR.**—The west crosscut on the 122 level is making good progress in favorable material, and No. 2 east crosscut on the same level is out 67 feet. Good progress is making in the northeast crosscut on the 222 level; also in sinking the shaft.

**BALTIMORE.**—The water is being handled without trouble and will soon be so far reduced as to allow of prospecting the ore deposits found some time ago. The ore cut on the 300 level promises to be of quite as much importance as that below.

**JUSTICE.**—A considerable amount of good milling ore is still in sight on the 600 level. There are on the dump at the mine over 1200 tons of ore ready to be worked when milling facilities can be obtained.

**ANDES.**—The west drift from the north drift, on the 240 level, is in vein porphyry of a favorable appearance. The west drift on the 350 level is in a fine quality of quartz which carries some ore.

**ALTA.**—Are working on the 725 and 825 levels; also are at work in the winze between the two levels.

Owing to the deep snow and freezing weather the mill has not been run for a few days past.

**SEGREGATED BELCHER.**—The south drift from the 1300 level raise is in 25 feet in low-grade quartz. As soon as this drift is in 30 or 40 feet further a west crosscut will be started from it.

**YELLOW JACKET.**—Are extracting and shipping 300 tons of ore a day. The ore is being taken out from between the 1100 and 1400 levels. The dump-ground at the mine is being extended.

**OPHIR.**—The winze below the 1300 level is still yielding the usual amount of good ore. The several prospecting drifts and winzes in other parts are being pushed forward as usual.

**SCORPION.**—On the 300 level the south drift is advanced 43 feet and the north drift 54 feet. Work was interrupted for a few days by the recent snowstorms.

**CUOLLAR.**—The main incline is down a little over 300 feet. On the 650, 550, 450 and 350 levels the several drifts are all making good progress.

**MEXICAN.**—On the 1300 level the west crosscut from the north drift is in soft vein material, in which there is a predominance of clay.

**HAYWOOD.**—The body of ore recently struck in the winze 200 feet below the tunnel level still continues to look and assay well.

**BENTON.**—Are drifting at the usual points on the 725 and 800 levels. The material is a vein matter of a promising character.

**UNION CON.**—On the 1300 level west crosscut No. 1 continues in vein porphyry of a promising character.

**BULLION.**—The usual progress is making in sinking the shaft from the 300 to the 500 level.

**POTOSI.**—On the 950, 450 and 250 levels all work is progressing as usual.

**UTAH.**—The work of repairing the north drift still continues.

#### Tuscarora District.

**NAVAJO QUEEN.**—*Times-Review*, Jan. 7: Making fair headway sinking shaft; total depth sunk and timbered to date, 162 feet. Ground on side of shaft next to ledge getting harder.

**NEVADA QUEEN.**—100-foot level: North drift has been advanced 20 feet. South drift extended 9 feet in very hard rock. 200-foot level: The winze has been sunk 10 feet; total, 90 feet. Bottom still in fine ore. Sinking has been stopped until No. 3 crosscut is in, when an upraise will be put up to connect with the winze. 350-foot level: No. 3 east crosscut has been driven 25 feet, and has cut into the ledge about 10 feet, showing the same kind of ore as in the winze above. It improves as the crosscut advances toward the footwall.

**FOUND TREASURE.**—Crosscut, 200-foot level, has been extended 20 feet during the week; total length, 90 feet. Formation continues same as at last report. Have passed through gangway vein, and a drift, which is opening up some water, has been started on it in a southeasterly direction. On this level, as on the 150-foot, this vein carries some good ore. The old works have been cleared of water.

**COMMONWEALTH.**—Main shaft has been sunk and timbered 19 feet. Bottom in solid blasting rock. North drift, 100-foot level, has been extended 15 feet. The ore has increased in width going north, showing 3½ feet, and is much higher grade than any ever taken from this level. Quite a flow of water comes through the vein.

**PONDRE.**—Have put on night shift on north drift and east crosscut. The crosscut is expected to cut ledge No. 2 50 feet deeper than present workings.

**GRAND PRIZE.**—The south intermediate drift from winze No. 1, extended 11 feet; face showing very rich ore. Stopes are looking and yielding well, both as to grade of ore and quantity.

**NAVAJO.**—South drift, west vein, 350-foot level, extended 6 feet. West crosscut No. 2 from near the face of the above drift is 10 feet. The face of both shows favorable looking porphyry.

**NORTH BELLE ISLE.**—North gangway, 400-foot level, extended 12 feet. The rock in the face is harder, but looks favorable.

#### Wild Rose District.

**THE WILD GOOSE MINE.**—*Silver State*, Jan. 10: J. V. McCurdy, superintendent of the Paradise Valley mine, received a message from Foreman Soper this morning informing him that they struck the Wild Goose lead in the lowest level, 700 feet below the surface, last night. A vein of rich ore about 14 inches thick was cut in the lead. This is the most important mining news received from Paradise for some time.

**PARADISE VALLEY M. Co.**—Ore produced and delivered to the mill, 97,500 pounds. Average assay value in ounces per ton—silver 20.92, gold 0.17. Mill run 175 hours and lost 17 hours. Reduced 72 tons of ore and 35 tons of tailings. Produced 340 sacks of concentrates, 23,065 pounds, per value \$2772.78, which were shipped to the Boston & Colorado Smelting Co., Argo, Colorado.

**NOTES.**—The roads are nearly impassable for loaded teams, consequently we are behind in getting ore to the mill and forwarding concentrates. The 150 level is still improving and we now have about 16 inches of good milling ore at this point of development and a large block of unexplored ground.

#### ARIZONA.

**TURKEY CREEK DISTRICT.**—*Cor. Prescott Journal-Miner*, Jan. 6: Work on the mines in this district is progressing finely. There is more work being done at the present time than for several years past. If reports are true, a company will soon have a large force of men at work on one of our prominent gold mines. Several miners are taking out rich ore, and as soon as the roads are open will send tons of high-grade ore to the sampler. Among the many rich mines is the Holmes, which can ship steadily. Roche is also working his mine and has shipping ore on the dump ready for sacking. The old Goodwin mine has been leased to Chas. A. Girdler, and he has quite a force of men at work developing the property. He has timbered the old shaft, cleaned it out and sunk it deeper. He has also commenced the sinking of a working shaft about 200 feet south of the old shaft, and is now down 15

feet. Shaft No. 3, just started, is about 100 feet north of the old shaft. The new shafts are on the ledge, but do not show any ore, but the owner seems to have faith enough to sink 100 feet or more in hopes to strike the pay streak which is supposed to be in this ledge. The old shaft did not show any signs of ore when cleared of the debris, but the vein showing up strong, sinking was commenced, and to-day they have got a narrow streak of pay ore which looks well, and may widen out as depth is obtained. Capt. Brann is opening a mine on Pine Flat, and expects to have enough pay ore out inside of the next 60 days to start up the mill. It is also reported that the Morning Glory is to be opened and a large force of men put to work next month.

**RICH BLUE DICK.**—*Prescott Courier*, Dec. 29: We are in daily expectation of hearing that the United Verde mines and smelter have been sold to Mr. Farrell, who will work the mines in a proper way and run furnaces as they should be run. The Blue Dick mine, Haysampa district, is, as we say in the West, "keeping up its lick." The recent shipment consisted of 27,689 pounds (gross weight) of ore, which sampled as follows: Copper, four cents; silver, 300 ounces; gold, one-half ounce per ton. Jack McDonald, one of the lessees, says he could have selected two tons of the lot that would have sampled 1000 ounces to the ton. The Signal Co. are running ten stamps and eight concentrators. Ore warehouses and bins at the Prescott sampler are overflowing with ore. N. L. Griffin, the pioneer Arizona miner, is here from Walker district, feeling well on account of promising developments in the mines.

**GLOBE.**—*Silver Belt*, Jan. 7: In ten months, under the supervision of Dr. A. Trippel, the Globe mine rendered a net profit of \$82,000, with an average 16 per cent and refined copper at 10½ cents per pound, in New York. This result, in view of present advanced price of copper, is very encouraging for the future, and a cause of gratulation, not only to the owners of the mine, but also to residents of Globe, where the mine is situated.

**WEAVER DISTRICT.**—*Mohave Miner*, Jan. 7: From a gentleman in from the Weaver district we learn that the Southwestern Mining Co. have purchased the Potter mining claim adjoining the claims of that company and have put a force of men at work on that property. The mill which has been lying idle for some time will shortly start up. The Layne mine, owned by Messrs. Hamlin, Vanes & Logan, is now down 60 feet and is getting better with depth. Some high-grade ore has been taken out by the present owners, and they are satisfied that it will continue. Owing to the weather and the condition of the roads but little ore has been received at the sampling works. A single lot for the C. O. D. mine was worked.

#### COLORADO.

**STRIKES.**—*Georgetown Courier*, Jan. 5: We have heard of several promising strikes made while doing annual labor on lode claims hereabouts. This work is compulsory, but it shows that some would rather stand around and talk hard times than go to work willingly. If the assessment were larger more strikes would be made. From Mr. VanAiken we learn that during the past year a shaft was sunk 200 feet on the Norman lode, one drift driven 25 feet, two others fairly started, and about 40 feet of crosscutting done. The workings show a good vein of ore and preparations are making to commence stoping. Mr. Hall expects to have the power drills in place on his tunnel within 60 days. Work is now progressing at the rate of between 50 and 60 feet a month, but with the drills it is calculated to make 100 feet monthly. We understand from general report that Astor Alliance matters have been so arranged that a large working capital is forthcoming to open up the property.

**FRED ROGERS' MINE.**—The indications are that this mine, which has turned out about \$300,000 from the shaft workings, will, during the coming year, take its old place as one of the main mines in the county. From Mr. D. McArthur we learn that the mine has been undergoing steady development from the Bonanza tunnel during the past year, a drift having been driven west 200 feet, east 200 feet, and a raise of 169 feet completed to the shaft, which gives excellent ventilation. The ground between the west level and the surface—about 500 feet—has never been explored. Some very good ore was taken out in running the level, and undoubtedly large bodies of rich ore lie hidden above. Two shifts are employed on the level west, which will be driven into the ground of the Cedar Rapids claim, the end line of which is 150 feet ahead of the breast of the level.

**NO STATEMENT.**—The Georgetown sampling works have not yet made out their statements of the amount of ore handled in 1887, and it is not at all likely that producers who have sold their ores to other sampling works and to smelters will take the trouble to give their shipments for publication, hence it will be impossible to give a satisfactory statement of the output of this vicinity. Heretofore we have depended mainly upon the smelters' reports to approximate the output of the county. The only works that have reported are the Omaha and Grant. If the producers and purchasers refuse to give their statements, how in the name of common sense are the newspapers to get at the output?

**ANOTHER STRIKE.**—The new year has been showering blessing on the mining men in the way of opening up good bodies of ore. L. Cohen & Co. have got it now, and got it big in the Nabob lode, on Silver Creek. From three to six inches of high-grade ore in the roof, breast, and under foot is enough for any man's Christmas. Mr. Cohen is engaged quite extensively in mining, having leases on the Virginia City, Pay Rock, Corry City and Seven-Thirty mines. Altogether, his 1887 mining operations have netted him quite a sum of money.

**HIDDEN TREASURE UNHIDDEN.**—The strike on the Hidden Treasure, Lincoln mountain, by Messrs. Mears, Markey & Bauer, is the most important made in years if it holds out, and we are not juggling words when we make this statement. The strike is made in an adit 250 feet in on the lode and at a perpendicular depth of 150 feet. They went for silver and got gold; an inch streak in a 10-inch vein of hard quartz is fairly alive with gold.

**TOMTICHI VALLEY SHELTER.**—*Crested Butte Pilot*, Jan. 5: The Tomtichi Valley smelter during 1887 handled 10,000 tons of ore, which is about 27

tons per day, while the present capacity of the smelter is about 45 tons per day. From this ore the smelter shipped 390,000 ounces silver, 1,400 ounces gold and 1300 tons of lead. The most of the ore came from the San Juan country. While there was about 1200 tons of ore shipped from Crested Butte, only about 500 tons was received by this smelter, the rest going to Denver and elsewhere.

#### DAKOTA.

**MONARCH.**—In the east drift of the crosscut from the bottom of the Monarch shaft water has become so troublesome lately as to force a temporary discontinuance of operations therein, and the force has therefore been concentrated in the west drift. Before driven out, however, ore which will do to mill was encountered. Confidence is expressed that before the east drift shall be extended another 20 feet a large body of free-milling, paying gold ore will be encountered. Water is being rapidly drained, through natural outlets and constant use of the pump, and work will in a very few days be resumed here. Assessment work lately completed on the Addenda, a Bald Mountain claim belonging to John McVean, resulted in the uncovering of a ledge of very good ore containing gold and silver in paying quantities. Another carload of Retriever ore starts from the mine for Omaha to-day. The Royal Arch M. Co., owning several claims at Bald Mountain, has started a force to work upon its property. Developments will be pushed vigorously and continuously, as the corporation is a strong one.

#### IDAHO.

**GOLD-BEARING ORE.**—*Idaho Avalanche*, Jan. 1: We hear that Mr. W. F. Sommeccamp, Sr., has cut a lode of fine-paying ore with the crosscut being run to strike the St. Clair lode. The ore is gold-bearing. We congratulate him on his new find, which is probably a stringer of the St. Clair. The crosscut will not reach the St. Clair for some time yet, but from present indications he will strike a large body of rich ore in the latter mine.

**FLINT.**—Everything is running smoothly at Flint. Rich ore was struck in the Rising Star drift on Saturday night last, and the development of the same is now in progress.

**ALTON DISTRICT.**—*Cor. Idaho Statesman*, Dec. 31: The Alton mining district is in the east part of Idaho county, and the mines are about 25 miles southeast of Warren's, between the South and Middle forks of Salmon river. The immediate vicinity of these prospects is watered by Big creek, itself a considerable stream, and a branch of the Middle fork. There are also two forks of Big creek which run in a southeasterly direction and unite about 12 miles from the source. The mountain ridge between them has great bulk and elevation, and in and upon such ridge lie nearly all the locations that have been made. This ridge may be called truly a part of the backbone of the continent on account of its height—the north side being covered with perpetual snow. From the crest other mountains covered with snow may be seen to the north and south, but the country slopes into basins upon the east and west. The Cleopland was the first ledge discovered and located. Its course is about northeast and southwest. It is situated upon the east face of a steep mountain. The ore carries silver with a little gold and a great deal of iron and other base metals, and though not exactly rebellious is complex and expensive to treat. It will pass for high-grade ore anywhere. Much of it has assayed from \$60 to \$150 per ton, and it looks as if it would go that much. A hole has been sunk 25 feet or so, disclosing a fine body of ore. A tunnel was started for crosscutting and had not reached the vein when winter set in and put a stop to further work. On the same mountain is the Beck, Mountain View and perhaps two dozen other locations of which not much is visible but location stakes and monuments. The development work has been of the kind made by miners in haste to sell. Long experience has convinced me that the district will do to tie to. The ore is there and the vein looks strong.

#### NEW MEXICO.

**SWEETSTAKE.**—*Kingston Shaft*, Jan. 4: The Sweetstake mining claim on North Percha is looking better than at any time in its history, although in 1885, 27 men were employed upon it, and it paid expenses with coyote workings. Barr & Bosley have the claim bonded. This claim is about two miles east of the Templar and Keystone, and a mile north of the Solitaire, and has the Solitaire croppings. Col. Crawford informs us that he has 500 feet of track laid on the Enterprise mine. This looks like business.

**SMELETER.**—*Lordsburg Liberal*, Jan. 6: The smelter at Clifton is about completed. The Arizona Copper Co.'s capacity is 250 tons daily. The managers of the Aztec mine are well pleased with the showings it has made. A Georgetown prospector recently found a pocket from which he took 200 pounds of ore worth 100 per pound. Smith, Wyman & Kimball, the original locators of the Kimball district, at Stein's pass, have signed over all their mining properties in that district to the Beck Consolidated Mining Co., of which they hold most of the stock. Kansas City capitalists are looking at this property with the view of purchasing.

#### MONTANA.

**GENERAL ACTIVITY.**—*Butte Miner*, Jan. 1: During the severe cold weather the Old Lexington mill on the east side suspended operations for a time. At the Parrot No. 7, on North Wyoming street, arrangements are being made to start up. Such improvements as the present state of the weather will allow are being made at the Colusa smelter. Next summer will see Meaderville as lively as Butte, as the amount of work laid out in mines, smelters, etc., will give employment to many artisans and laborers. The old ore dump that has lain undisturbed so long at the Gray Eagle mine is being hauled to the smelter for reduction. Some trouble is being caused in the Basin district by parties surveying over ground of others and making applications for patents. There is uneasiness among many of the claimants in this city, and steps are being taken to frustrate the designs of the parties who are trying to get patents for more ground than belongs to them. The parties interested believe that there

will be quite a mining boom in Basin next summer, owing to the cheap transportation of ores assured by the new railroads. At the Chambers Syndicate group of mines everything progresses as usual. When the new Anaconda works are completed more miners will be employed, as at present but a limited quantity of ore can be disposed of. The Mountain View has about all its improvements completed except placing in position the new engine that is daily expected to arrive. The small engine that has been used in developing the property from the grassroots down to its present depth is still used for hoisting. A large number of miners is employed in enlarging the stations and running drifts, and when the large engine is in position, the work of hoisting ore will be actively and continuously carried on. Considerable ore is being produced and reduced at the works of the company at Meaderville. The large Cornish pump that has been placed in the bed of Silver Bow Creek at the Blue Bird mill is now in operation, supplying water to the works. At the Hope mine not long since there were probabilities of suspension, but the company has opened up a new body of ore in virgin ground that is equal in extent and richness to any previous strikes in the mine.

#### OREGON.

**SILVER CREEK MINES.**—*Bedrock Democrat*, Dec. 29: The California mine is turning out good ore. The Appomattox vein is at least 20 feet wide, not all rich ore, but it contains a pay streak or chute that is very rich and from which we are now taking ore, which we will ship, as we did that from the California, to Denver for reduction. We expect to make a shipment the latter part of February. We are now driving a tunnel that will cut the ledge at a depth of 75 feet. When we complete this tunnel we will have our mine in very good shape to work. The Eureka, the property of Jon. Bourne, Jr., of Portland and C. W. Knowles, is the best showing for amount of work done on any mine on the Pacific Coast. A tunnel cuts the ledge 200 feet below the surface, running parallel with the same, and the pay ore fills the full width of the tunnel, 4½ feet across. The ore will average \$25 or \$30 per ton, and there is any amount of it in sight. The company has between 250 and 300 tons of the ore on the dump, and they don't propose to ship away a pound of it, either, but intend in the spring to put \$75,000 worth of machinery on the property and do their own milling. The Eureka, as are the other mines I have spoken of, is in a slate formation, is easy of access, surrounded by an abundance of excellent timber and is close to as good water-power as one could desire. I could tell you of a dozen other prominent mines in the Silver Creek mining district, but don't care to take too much of your space at this time. I will only add that the success of our district is a certainty and that before many months we will have a boom, and one, too, of no small proportions.

#### WASHINGTON.

**RICH GOLD ORE.**—*Ellensburg Capital*, Dec. 24: From Andrew Munden, a practical miner who has been doing assessment work on the Shafer company's mines in the Peshastan district, the following facts are gleaned: In driving west upon the 120-foot level in the Humming Bird, a ten-inch vein of rich specimen ore has been struck. Handsome free gold specimens are obtained from the streak, which is steadily growing stronger and bids fair to develop into a big ore body. Peshastan miners are jubilant over the strike in the Humming Bird, as hitherto everybody appeared to be afraid to investigate the lower levels of the Peshastan camp. In the mines both east and west of the Humming Bird, better rock was in sight at close of the season than has been exposed in the camp for a long time. In the Henton Fraction (next east of the H. B.), 18 inches of rich free gold rock was opened out in driving west. This assures plenty of good ore in that claim, as also in the Humming Bird ground, which is thus far unbroken. In the Bob Tail claim on the west, four to five feet of rock that will yield \$25 and upward per ton in free gold is in sight. Farther up the mountain in the old Shafer ground, Donahue and Teets have a rich body of ore exposed. Both of the last named miners are building arrastras, one on Nigger creek and the other on the Peshastan. Next season quartz mining on this creek will be conducted with greater activity than ever before.

#### UTAH.

**ORE AT BINGHAM.**—*Salt Lake Tribune*, Jan. 8: The Brooklyn mine, Bingham, has 200 tons of ore piled up at the mine awaiting shipment, and 100 tons was on the market in this city yesterday, M. M. Kaighn goes to Bingham to day and will try to get more teams to haul ore. The reason of having 200 tons out ready for shipping is that teams could not be procured to take it to the railway at Revere. Snow is not deep enough about Bingham to give any trouble, and mining is going on steadily.

**SLIDE AT CENTENNIAL EUREKA.**—An Iron-ton dispatch to W. W. Chisholm yesterday, stated that a big snowslide had destroyed the bunk-house at the Centennial Eureka mine, but that no one was hurt. There have been plenty of snowslides in the gulch, but it was not remembered that any ever took that direction before. The mercury down there was 15 degrees below at 7 A. M., yesterday.

**BULLION SHIPMENTS.**—*Park Record*, Jan. 7: The bullion shipments for the past two weeks were as follows: Ontario, 46 bars, containing 25,291.14 fine ounces of silver, shipped on Dec. 31st. Another shipment will be made to-morrow. Daily bullion from the Marsac mill: Dec. 26th, 8 bars, 9166 ounces; 26th, 8 bars, 8958 ounces; Jan. 1st, 8 bars, 9390 ounces; 7th (to-day), 6 bars, containing 6598 fine ounces silver; total, 30 bars, 34,172 ounces. Owing to the bad condition of the roads, the ore shipments from the Ontario, Daly and Crescent were very light.

**THE COAL FINDS.**—Negotiations are pending, and which no doubt will soon be perfected, for the early development of the coal deposits lately discovered near Sunnyside. It is believed that there is anthracite coal there, and it is proposed to go far enough with drifts to fully test the extent and value, and for this purpose a good company will be formed, to be backed by ample capital for pushing the enterprise.

## THE DOUBLE "ECONOMIC" STAMP MILL

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

## TATUM & BOWEN,

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.  
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Handy and Fisher vs. R. Hoskin et al.

We also manufacture the Single-Jointed Giants.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,  
39 to 51 Fremont St., San Francisco, Cal.

This cut represents our

### IMPROVED HYDRAULIC MACHINE.

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

96 Liberty St., New York.

PACIFIC COAST AGENTS,  
PARKE, LACY & CO.  
SAN FRANCISCO.

## THE FRISBEE-LUCOP MILL, A CENTRIFUGAL ROLLER MILL

For Reducing Ores, Quartz, Phosphate and Cement Rock, and other Mineral Substances to any required degree of fineness most rapidly and economically.

All substances when ground leave the mill in a finished state—no regrinding being necessary. Automatic Feed. Wearing parts of Steel and Forged Iron.

### BLAST AND SCREEN MILLS.

Sizes.....	24 inch.	90 inch.
Weight.....	5500 lbs.	3800 lbs.
Speed.....	360 rev.	500 rev.
Horse Power required.....	15 to 18 H. P.	6 to 9 H. P.
Space required.....	64 x 4 x 4 feet.	6 x 3 1/2 x 4 feet.
Size driving pulleys.....	23" D. x 8" face.	20" D. x 7" face.

Capacity, 24-inch mill, 1 to 2 tons quartz per hour, to 60 mesh; 3 tons cement or phosphate rock per hour, to 50 mesh. Wearing parts require no fitting, easily and cheaply replaced when necessary. Cost of repairs differs with circumstances. Less than 1c per ton for phosphate and cement rock. Maximum, 10c. per ton for hardest quartz. For further particulars and prices address

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JANUARY 3, 1888.

- 376,022.—GRADING SCRAPER—L. E. Ashley, Stockton, Cal.  
 375,916.—CROSSCUT-SAW HANDLE—M. Bennett, Eureka, Cal.  
 375,795.—DEVICE FOR OBTAINING VERTICAL LINES—J. Beyerle, Vallejo, Cal.  
 375,800.—SAWMILL SET WORKS—W. A. Campbell, Portland, Ogn.  
 375,801.—SAWMILL STOCK ROLLER—W. A. Campbell, Portland, Ogn.  
 375,802.—SIDEHILL FLOW—Elisha Clark, Felton, Cal.  
 375,817.—BED-LOUNGE—John Hoey, S. F.  
 375,999.—CONCRETE PAVEMENTS—P. H. Jackson, S. F.  
 375,822.—ANIMAL TRAP—B. P. Jolly, Soledad, Cal.  
 375,940.—VEHICLE WHEEL—Walter Knight, San Andreas, Cal.  
 375,826.—WAGON-SPRING BRACE—F. H. Mason, Saucelito, Cal.  
 375,829.—PISTOL-HOLDER—R. Newman, S. F.  
 375,837.—PRESSURE REGULATOR—E. A. Scott, S. F.  
 375,899.—ROTARY WATER METER—S. L. Shufleton, Eureka, Cal.  
 375,779.—FIRE TRUCK AND LADDER—Smith & Mansfield, Oakland, Cal.  
 376,044.—GRAIN SCALE AND REGISTER—L. Reynolds, Yreka, Cal.  
 375,844.—SHOW-STAND—C. Toohy, S. F.  
 375,845.—TANNING—Wær, Phillips & Kengla, Tucson, A. T.  
 375,972.—DRESS CHART—Josephine S. Wilson, San Jose, Cal.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast Inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

WAGON-SPRING BRACE.—Frank H. Mason, Saucelito, assignor of one-half to Geo. V. Kennedy. No. 375,826. Dated Jan. 3, 1888. This is an improvement in the braces of wagons by which the springs are kept in position. The spring brace is connected by a lever operated by the bed, so the brace is kept tight at all times. In the construction patented the brace is kept tight under all circumstances and will not rattle.

SIDE HILL FLOW AND ROAD-GRADER.—Elisha Clark, Felton, Santa Cruz Co. No. 375,802. Dated Jan. 3, 1888. This reversible plow may be also used as a road-grader. It consists of a plow-beam united to a land-side or shoe at the bottom by means of a vertical post or posts, and having the mold-board and plow-share supported in front of the post by a vertical shaft or spindle, about which it may turn to stand upon either side of the plow-beam, and with either point toward the front to correspond with the plow point, the latter being formed upon the stationary shoe.

BED-LOUNGE.—John Hoey, S. F. No. 375,817. Dated Jan. 3, 1888. This is a bed-lounge in which the back or other portions, such as the arm, is adapted to assume, when used as a sofa, an upright position, and when used as a seat a horizontal position in line with the seat portion. The invention consists of a new and useful device which acts as a support for the back or other portion when in an upright position, and as a leg therefor when it is in a horizontal position. The object of the invention is to provide a simple and effective support for holding the back or other folding portions upright and a leg for supporting it when thrown down to be used as a bed.

ANIMAL TRAP.—Bertie P. Jolly, Soledad, Monterey Co. No. 375,822. Dated Jan. 3, 1888. The trap is specially designed for go-phers and other hurrowing animals. It is one of those made of spring wire arms held in position by a trigger, which is operated automatically by the throwing of the earth against it. The invention consists in a single piece of spring wire, having its ends bent at an angle and curved in opposite directions through approximately 180 degrees, said ends crossing or interlocking, and in a trigger formed by a single piece of wire, the ends of which are bent at right angles, one end being provided with a notch for engaging one side of the main spring wire, and the other being broadened or flattened out to receive the impact of the earth. This trap is of very cheap and simple form.

SHOW-STAND.—Cornelius Toohy, S. F. No. 375,844. Dated Jan. 3, 1888. This is one of the class of stands or cases for containing goods for exhibition or show. It consists in an upright framework provided with vertical rows of parallel transverse bars or supports adapted to receive and support in a vertical series the cases, boxes or cases containing the material to be exhibited, and a supplementary transverse bar or support at the base of the frame forming the key of the series of superposed boxes,

cases or cases, which defines or determines their angle. The invention further consists, in combination with a frame of this character, of the cans, boxes or cases containing the material to be exhibited, and having an access door or lid on the back of the upper portion of each which may be operated when all the cases or boxes are in position without interfering with their place in the stand. The object is to provide a practical show-stand for such goods as crackers, teas and other materials usually contained in cans or boxes and without disturbing their primary adjustment in the frame, to be able to reach their contents without difficulty.

DEVICE FOR OBTAINING VERTICAL LINES.—Joseph Beyerle, Vallejo, assignor of one-half to W. F. Fountain, Oakland. No. 375,795. Dated Jan. 3, 1888. The principal use of this device is upon vessels and in places where the relative position or parallelism of one floor or deck to the one below must be determined. If a vessel is having the stanchions set between the decks, it is necessary to place them on what would be a vertical line with the keel, if the vessel was exactly on an even keel. This is rarely the case, however, whether the vessel is in the water or in a dock; but as the decks or beams have been originally put in at right angles with the keel and parallel with each other, it is easy to use these beams or decks as a base to which the device may be attached. Vertical lines can be obtained in any place where a plumb-bob cannot be applied, as on a vessel in motion. It may be employed to find the center of bed-plates or other machinery on board a vessel. It can also be used to make a survey in cities where it is impossible to bring the instrument directly over the line on account of walls and for many other purposes. The device has nothing to do with the tripod of any instrument, and only appears with it when used upon such instruments as are supported on tripods. It is used on shipboard without any tripod whatever. This device for finding a point which shall be in a line perpendicular to a table or surface, and passing through a given point thereon, consists of a plate attachable to said table or surface, a rotary shank or spindle pivoted with a universal joint to said table, and an extensible leg jointed to the spindle and provided with a locking screw by which it is fixed at any desired angle with said plate.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department to, San Francisco:

DEL MONTE M. Co. Jan. 7. Location, Tuscarora, Nev. Capital stock, \$1,000,000. Directors—E. Scott, M. A. Jackson, J. W. Pew, J. F. Cassell and F. A. Berlin.

DICKMAN-JONES Co., Jan. 11. Object, to carry on the business of printing, publishing and lithographing. Capital stock, \$200,000. Directors—Charles J. Dickman, George Jones, Michael Hettrick, Frank C. Hornung and Louis Sloss Jr.

MONTREY EXTENSION R. R. Co., Jan. 7. Capital stock, \$25,000. Directors—Chas. Crocker, Chas. F. Crocker, Timothy Hopkins, W. V. Huntington and N. T. Smith.

NORTH COMMONWEALTH M. Co., Jan. 7. Location, Nev. Capital stock, \$1,000,000. Directors—E. Scott, M. A. Jackson, J. W. Pew, J. F. Cassell and F. A. Berlin.

PACIFIC WATER & LAND DEVELOPMENT CO., Jan. 8. Capital stock, \$2,000,000. Directors—G. H. Thompson, P. C. Rust, L. P. McCarthy, H. C. Stillwell and C. H. Ramsden.

PALERMO LAND AND WATER CO., Jan. 7. Capital stock, \$500,000. Directors—Henry Wise, D. W. McAfee, A. S. Baldwin, D. K. Perkins and George C. Perkins.

SAN DIEGO CABLE RAILWAY RIGHTS CO., Jan. 9. Capital stock, \$100,000. Directors—F. L. Castle, S. Steiner, J. M. Thompson, M. B. Keller and R. H. Young.

SIERRA LAKES ICE CO., Jan. 7. Capital stock, \$1,000,000. Directors—Moses Hopkins, E. W. Hopkins, C. A. Graw, J. Hoehn and Russell J. Wilson.

S. F. BOOT & SHOE MANUFACTURING CO., Jan. 8. Capital stock, \$25,000. Directors—J. N. Harrison, W. Martin, G. W. Lewis, R. H. Webster and Geo. F. Lamb.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Savage, Jan. 7, \$52,000; Hale and Norcross 7, \$45,000; Bluebird, 3, \$16,560; Moulton, 3, \$15,600; Cons. California and Virginia, 7, \$77,393; total for December, \$259,000; Savage, 7, \$52,000; Hale and Norcross, \$45,000; Moun- Diablo (for December) \$42,203; Eureka Con. 7, \$20,000; North Belle Isle, 7, \$36,000; Chollar (for December) \$27,144; Hanauer, 4, \$12,600; Silver Reef (for December) \$22,264; Germania, 4, \$5153; Hanauer, 5, \$2470; Germania, 5, \$1706; Hanauer, 6, \$4800; Crescent, 6, \$5700; Germania, 7, \$3328; Hanauer, 7, \$2460; Germania, 8, \$1577; Hanauer, 8, \$5500.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

## New York Metal Market.

Telegraphic advices dated Jan. 12th give the following New York prices:

SILVER—96 1/2 per oz.  
 BORAX—61 @ 6 1/2.  
 COPPER—LARK—\$16 @ 17.00.  
 IRON—No. 1, \$22 00.  
 LEAD—\$4 57 1/2.  
 TIN—\$37.00.

The following is the latest by mail from the "New York Metal Exchange Market Report":  
 COPPER—Firm, spot closing at \$17.70 @ 17.00. Transferable Notices (Lake) issued at \$16.00 @ 15.00.  
 LEAD—Firm at \$4.96 @ 15 spot. Transferable Notices issued at \$5.10.

TIN—Strong at \$36.90 @ 37.20. Transferable notices issued at \$37.10.

MAKERS' PRICES—At tide-water. 100-ton lots of listed irons (when brand and specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.60 @ 21.00; No. 2, \$19.60 @ 20.00; Grey Forge, \$17.00 @ 17.50; Hudson River, Grade No. 1, \$20.60 @ 21.00; No. 2, \$19.00 @ 20.00; Grey Forge, \$17.00 @ 17.50; Southern, Grade No. 1, \$20.00 @ 21.00; No. 2, \$19.00 @ 20.00; Grey Forge, \$17.00 @ 17.50.  
 Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$37.00 @ 37.60; Biliton Tin, \$37.00 @ 37.60; Banca Tin, \$37.00 @ 37.60; Baltimore Copper, \$14.75 @ 15.25; Orford Copper, \$15.25 @ 15.75; P. S. C. Copper, \$13.00 @ 14.00; Foreign Lead, \$5.40 @ 5.60; Foreign Spelter, \$8.10 @ 8.30. Antimony, \$11.25 @ 11.40.

## Mining Share Market.

The stock market continues dull and heavy, and the leading securities are at quite a low standard. This seems in no way to discourage the miners up on the Comstock who are working away and developing their mines vigorously. The Virginia Enterprise says: The new ore body on the 700 level of the Hale and Norcross is expanding in every direction, and the ore instead of deteriorating is growing richer at all the more important and significant points as the work of development is proceeded with. Even as it now stands, this ore body is the biggest bonanza that has been struck on the Comstock in many years. It is a huge, clear and clean body of ore, with no water or anything else to interfere with its easy and expeditious extraction. It is almost like so much money in the bank.

In the Yellow Jacket mine a promising development was made some days ago on the 1100 level in the main east drift. As the ore was cut into at a point near the Confidence line, it also promises well for that mine.

The Con. Cal. and Virginia Co. last Wednesday shipped below \$77,000 in bullion, making a total of \$259,000 for December, with another cleanup yet to be shipped.

## Consolidated Miners' Union.

There is a movement on foot in this city to organize a "Consolidated Miners' Union," with headquarters in San Francisco, and branches in the various mining districts of the Pacific Slope. A circular letter has been issued and sent to mining men, calling for a meeting. Jas. H. Crossman is at present acting as secretary of the committee. The following is from the circular letter referred to:

The object of this letter is for the purpose of securing the co-operation of not only mineral producers, but all classes that are interested in the prosperity and advancement of our mining industries, which have been, and should be to-day, the paramount industry of the entire region west of the Sierra Nevada range.

Metallic gold was the factor that first incited immigration, and the product of our mines attracted the attention of the entire civilized world. The State of California sprang into existence as if by magic, and in the brief space of one decade assumed a position in our federation second to none.

During the late civil war the golden product from our mines preserved the integrity of our Union, it built and equipped our transcontinental road, which was considered at that time a military necessity.

The gold and copper of California and the silver and lead from the State of Nevada furnished the capital that built our cities and made our population richer per capita than any other State in the Union.

Regardless of politics, we claim that there should be a protective tariff sufficiently large to protect the products of our mines. Let the duty on iron, coal, copper, lead and other minerals be removed, and we cease to produce, with an immense loss to mine-owners, and hundreds of thousands of operatives thrown out of employment.

We require Congressional action during the present session of Congress, and in place of removing the tariff on the above-named metals, we ask our Senators and Representatives in the Halls of Congress to do all in their power to increase it, in order to protect those industries as against the foreign production.

With this object in view we ask your earnest co-operation by unity of action and assistance in the formation of a Consolidated Miners' Union, composed of men of known and established integrity. We expect to accomplish our object, and that our voices as a unit will have weight in the Halls of Congress during the present session, thereby fostering and protecting our mineral interests.

We ask you to become a member of this organization. We ask both moral and material aid in furtherance of our views. The expense to each individual member will be nominal, compared to the benefits that we shall naturally derive.

We propose to establish our headquarters in San Francisco, with ramifications and branch organizations extending from New Mexico on the south to British Columbia on the north, inclusive of all the mining districts on the Pacific Slope.

Organization and consolidation of interests is the only safe mode of protection. It commands the attention of the public and the press, and insures Congressional action. Concentrated organization is a necessity for protective purpose.

We are advancing no new theory, no chimerical scheme, but one that has been adopted and efficacious in the production and manufacture of all the great staples of the world. Where would the manufacturing interests of New England have been, had it not been for a most thorough system of co-operation and organization in the infancy of their industries?

The protective tariff had bitter opponents, free trade was advocated, and the New England Manufacturing Association was formed and compelled to act in union in order to foster and protect their industries. They selected the celebrated orator and jurist, Daniel Webster, as their champion, and it was largely due to his exertions that they won the fight and succeeded in establishing an industry that made New England prosperous beyond precedent.

We say again: We ask your co-operation and device as to the best mode of procedure in the accomplishment of our object, and a prompt response to this circular, addressed to the undersigned, will receive due consideration and attention. By order of the committee.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by leading their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOAN—Santa Clara Co.  
JOHN C. H. LAMPADUS—San Benito Co.  
G. W. INGALLS—Arizona Territory.  
WILLIAM POOL—Fresno Co.  
WM. WILKINSON—San Joaquin and Stanislaus Co's.  
A. F. JEWETT—Tulare Co.  
E. H. SCHAEFFLE—Flacsa, Sacramento, El Dorado Co's.  
C. E. WILLIAMS—Yuba and Sutter Co's.  
R. G. HUSTON—Montana Territory.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

**MINES IN TERRITORIES.**—In a recent interview James G. Fair stated that he favored the passage of Senator Hearst's measure to allow the sale of mining properties in Territories to aliens. "It is necessary," he remarked. "As a rule Americans do not invest in mining properties. The wealthier men owning mines are all old and will soon pass away. If they cannot sell to foreign people the properties may lay unworked for years."

THE canned-goods exchanges of Baltimore are making efforts to have the duty taken off tin or greatly reduced. It is estimated that 150,000,000 cans are made there annually.

HOMESTAKE MINING COMPANY has declared its 113th regular monthly dividend of 20 cents per share, or \$25,000; total dividends to date, \$3,993,750.

IN Southern California the building of the Great Salt Lake and Los Angeles Railroad is considered assured.

## THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

**Golden State and Miners' Iron Works**  
Sole Manufacturers,  
527 First Street, San Francisco, Cal.

HORACE D. RANLETT,  
Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,  
NEWTON COPPER MINE, Amador Co.  
Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

## QUARTZ MINES FOR SALE.

Under good roads, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

**H. H. H. HORSE LINIMENT.**  
THE H. H. H. Horse Liniment puts new life into the Aged and the Young. For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

## DIVIDEND NOTICE.

## The German Savings and Loan Society.

For the half year ending December 31, 1887, the Board of Directors of the German Savings and Loan Society has declared a dividend at the rate of four and one-half (4 1/2) per cent per annum on term deposits, and three and three-fourths (3 3/4) per cent per annum on ordinary deposits, and payable on and after Tuesday, the 3d day of January, 1888. By order

GEO. LETTE, Secretary.

**JOHN A. ROEBLING'S SONS CO.**  
**WIRE ROPE**  
GALVANIZED SHIP RIGGING, MINING, TILLER,  
ELEVATOR, TINNED, & COPPER ROPE, SASH CORDS.  
LARGEST WIRE ROPE WORKS IN THE WORLD.  
**IRON & STEEL WIRE OF EVERY KIND.**  
TELEGRAPH WIRE, HARD & SOFT COPPER WIRE  
INSULATED FOR ELECTRIC USE.  
WIRES OF IRON & COPPER, FENCE WIRE,  
SWEDISH IRON WIRE, CRUCIBLE STEEL WIRE.  
TRENTON, N.J. & 14 DRUM ST. SAN FRANCISCO, CAL.

## ELECTRIC DEVELOPMENT COMPANY.

## Incandescent &amp; Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries,

For Mines, Hoisting Works, Mills, Reduction Works,  
Indoor and Outdoor Illumination of every kind. Gas, Oil and Candle superseded by the

## EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

## "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.  
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

'CHALLENGE,' 'STANFORD,' 'TULLOCK,' & 'ROLLER' FEEDERS,  
And will furnish descriptive Catalogues and quote prices upon application.

**JOHN T. SULLIVAN,**  
20 Fourth St., Pioneer Building,  
**Boot and Shoe Maker.**

Maker of the famous Miners' Shoe.

**THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.**

**ADAMS & CARTER, Agents Frue Vanning Machine Co.,**  
Room 7, No. 109 California Street, **SAN FRANCISCO, CAL.**

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE "TRIUMPH" ORE CONCENTRATOR.**

The present improved form of this celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Train Telegraphy.

Not many months ago the Railway and Telegraph Co. and the Phelps Induction Co. combined their interests and patents into one new company under the name of the Consolidated Railway Telegraph Co. Then a series of experiments were made on the line of the Lehigh Valley R. R. Co. to compare the two systems and ascertain the best manner of combining them.

After a course of careful experiment, the electricians of the company found that they could, by selecting the best features of both systems, produce a simplified method combining all the valuable features of each, which would be very much superior in simplicity, certainty of operation and ease of application to either of the others. The system is covered by a large number of patents, protecting not only the foundation principle involved, but also numerous details absolutely necessary in induction telegraphy. By means of the "duplex" feature it can also be used for telegraphing between side stations or terminal stations and moving trains, and simultaneously telegraphing between stations by the ordinary Morse system. This system of train telegraphy works equally well in all kinds of weather.

In brief, the new combined system mainly consists in the use of a "short pole" telegraph line extending along the side of the railroad track at about a distance of 8 or 10 feet from the line, the poles being much smaller than ordinary telegraph poles and from 10 to 16 feet high. At their top is placed an ordinary glass or porcelain insulator, strung upon which is a single galvanized steel (or iron) telegraph wire, about No. 12, American gauge. The equipment of the car is simple, mainly consisting in the use of an iron or brass rod or tube, about half an inch in diameter, extending along each side of the car under the eaves (also, instead of employing this metal rod or tube, in many cases the metal roof of the car is used to advantage in their equipment), and connected by means of an insulated copper wire with the battery and instruments in the car, which are grounded

through the wheels and track by means of a single wire run through the floor as shown by Fig. 1. In this cut *A* represents the roof contact; *B*, rod or strip of metal, substitute for roof, if roof not practicable; *C*, secondary of induction coil; *D*, double pointed key with extra contact; *E*, telephone receiver; *F*, primary circuit; *G*, ground contact on box; *H*, battery. The instruments are small

Fig. 3—Arrangement of Apparatus at Terminal Station.

actual use in connection with and upon six daily trains of the New Jersey division of the Lehigh Valley R. R. See Fig. 4.

The cost of equipping a railroad with this system in the above manner depends somewhat upon the character of the roadway, nearness to telegraph pole markets, etc., but it can be stated approximately to be about \$50 per mile for line equipment (i. e., poles, placing of

train a telegraph office in constant electrical communication, as in the usual telegraph business.

Fig. 3 shows the details of arrangement of apparatus at terminal station. In this cut *A* is the double pointed key; *B*, induction coil; *C*, battery; *D*, primary circuit; *E*, extra contact key; *F*, secondary circuit; *G*, telephone and circuit; *H*, electro magnets; *I*, Morse apparatus; *J*, earth connection; *K*, condenser.

The first cost of placing this system upon a railroad has already been stated, and when the fact is taken into consideration that it affords a railroad company a distinct, separate and perfectly equipped duplex telegraph line, useful not alone for train telegraphy, but also available at all times for ordinary telegraphy between stations, it can readily be seen by comparing the advantages and conveniences obtained

that the actual cost of equipment of line, rolling-stock, etc., is less than that of any signal or block system, even of the simplest description that has ever been presented to the railroad public.

In regard to the expense of operating upon freight trains, the method of using this system has demonstrated that it is possible to have the freight conductor, or some other member of train crew, a telegraph operator. Upon passenger trains a separate operator in most cases would be necessary.

In Fig. 4 is shown the interior of a car with train telegraph operator sending a message on a moving train. The sending apparatus is shown in the operator's hands, the receiver being attached to his ear. The

operator can be in any car, but is best located in the middle of the train. Thos. A. Edison is the consulting electrician of the Consolidated Railway Telegraph Co., Chas. A. Cheever, president, and Henry D. Hall, secretary. The general offices of the company are at 13 Park Row, New York.

JOHN W. MACKAY has gone to the Comstock to again give his personal attention to the work in the mines controlled by his firm.

FOUR new life-saving stations are to be established by the Government in the vicinity of San Francisco.

Fig. 4—Sending Telegram on Moving Train.

Fig. 2—Main Operator's Equipment with Battery.

Fig. 1—Car Equipment.

## TELEGRAPHING FROM A MOVING TRAIN.

and compact, and consist of the telephone receiver (upon head of operator), [see engraving] a small secondary coil and buzzer, and an ordinary telegraph key, these last two being placed upon a board about 10 or 15 inches square, held conveniently upon the arm of the operator.

The battery consists of a few cells in a small box conveniently carried in one hand. See Fig. 2. The cars can be quickly and easily equipped without interfering in any way with their appearance or causing delay. The equipment of a station is similar to that of a car. See Fig. 3. The equipment of a "line" station is adapted to the regular "Morse" apparatus. This is the apparatus and equipment now in

same, wire, labor, insulators, etc.), and the cost of equipping a car about \$15, only one car on each train needing to be equipped. When the ordinary telegraph wire on the side of the track is near enough to the line of road, it is possible to use that wire.

There are now two distinct uses of this system of train telegraphy. The first is for the purpose of having train dispatchers and other railway officials in constant and instant communication with all trains on their road, whether in motion or standing still, and for the purpose of preventing accidents by mistakes occurring in transmitting train messages by side stations. The second use is in making every

### Battery and Pan.

#### The Electric Process on the Comstock.

The Virginia Enterprise says: There has not been a single change made in the system of wire rope transmission of energy from Pelton wheels as adopted at the Con. Cal. Va., and there will not be. This statement is called forth by the fact that it has been said that the system was only a qualified success—a mere make-shift. The truth is that there has not been even a bolt touched since they were put in, and to-day everything connected with the system is running almost perfect.

#### Where the Trouble Has Been.

The trouble experienced so far has been confined exclusively to the splices in the wire ropes. The motion of the ropes caused a given amount of friction, and this chafing of strands in the splices soon parted them. Now oil is used that penetrates the hemp core, and this in turn lubricates the strands on the inside, preventing chafing and wearing out. The splicers are getting the thing down finer and putting in better splices, and no further trouble will be anticipated from that source after the first splices made have been renewed, if they should at any time require renewal. The chafing that existed was ascertained by taking out the splices and examining each strand separately.

#### Two More Wire Ropes.

An extra wire rope will soon be put on to transmit power to the pan-mill and another one to the battery-mill. Additions are already being put on the towers on the southeast side, and Alex. McCone of the Fulton foundry is molding the grooved wheels. The object of putting on this extra rope is merely precautionary, so that in case of the parting of strands in any of the other ropes all there will be to do will be to detach the injured rope and there will remain three to do the necessary work. At the battery-mill the work is already far advanced toward completion. There is now a seven-eighths inch rope there which drives 70 stamps and 12 Boss special grinders. The additional rope will relieve the present rope about 48 per cent and drive 10 additional stamps.

Tighteners have recently been placed at the pan-mill and at the starting-place at the driving shaft, and it is now only the work of a minute to tighten a rope up even with its mates.

The engines at the pan and battery mills are also kept in running condition in case of any possible emergency, and it would be the work of only a few hours to run both mills by steam-power if occasion should require it, but this is a very remote contingency.

#### Water-Power.

This subject, though often treated, is but slightly understood. An aperture 12½ by 12½ inches, under a pressure of six inches above the top of the opening, will discharge 200 inches, and is the basis of all measurements where water is retailed in small quantities in the States of California and Nevada. A miners' inch will discharge a quantity of water equal to 12,250 cubic feet, or about 17,000 gallons, or 139,000 pounds, in 24 hours. At the Con. Cal. Va. they are using 135 miners' inches, or 2,300,000 gallons, in 24 hours. This is equal to a weight of 19,166,666½ pounds of water. It furnishes 600-horse power on four Pelton wheels. When they are running all their machinery in both mills, including dynamos, special grinders, small pans, etc., they will use 160 inches. As things are now run there are 400 horse power left on the wheels, and when everything is running there will be nearly 200-horse-power left, which they may use to run dynamos to furnish either light or power. Things are so arranged that they can run the machinery down to 10 revolutions per minute, and allow them to change belts, or run it up to 200 revolutions per minute. If that does not prove complete control of a giant power, what does?

#### The Electric Process.

Mr. Shepard Brickell, electrician, has placed five dynamos in the engine-room of the pan-mill and connected them by belt and pulley with the transmitted water-power. It is impossible to understandingly describe the modus operandi, but, to make it short, the entire work may be conducted from the engine-room by pressing on buttons and cutting off circuits or releasing them. Ten or 20 pans are ready to run and 10 more are far advanced toward completion. Only half of the mill will be treated by the electric process at present, and the result will be compared with the workings of the other half.

The electric attachments to the pans are very simple propositions. The pans are wooden-coated inside, and the shoes are made of wood. The electric anode, or positive pole, consists of a flat iron rim, fitting the pan, from which are suspended a large number of light iron pendants, and the bottom of the pan acts as the cathode or negative pole. The connection is made from the electric wire by four light iron rods, which sustain the weight of the whole. The pendants conduct the electricity to the quicksilver, help amalgamation and prevent flouing of the quicksilver.

#### Miscellaneous Notes.

The Boss process at the pan-mill is an unqualified success. There is not a mill in the State that works ore to as high a percentage,

and its progress since its introduction here has been continually for the better.

The men in charge of the transmission of power and of both mills have worked hard for success, and are entitled to due credit for the eminently satisfactory condition of things which they have brought about.

There is no question about the success of the entire undertaking. It is now not only as assured but a positive fact, fully demonstrated. The battery and pan mills now turn out more billion than any other mill in the State.

### Oil and Gas Found.

A very interesting report comes from the oil-well west of here. Mr. Hambleton came in last week and stated that at a depth of 720 feet his tools broke through the oil sandstone, in which he had been boring for some distance, into a gravel-bed, and immediately an immense volume of gas issued forth from the well. So great was the volume and its force that it blew oil and gravel as large as walnuts, out at the top and into the air some 30 or 40 feet. The workmen were compelled to leave the spot, the gas being suffocating. It had continued to pour out for some days when he left and there was no apparent diminution in the supply since the first outburst. As it rises out of the pipe it has a bluish cast and the odor is exactly like that of regular coal gas. He thinks that the first outburst raised gravel and oil that has somewhat choked the pipe, and that when that obstruction is removed he may have a flowing oil-well as well as an inexhaustible gas-well. This property is in section 19, township 30 south, range 22 east, M. D. B. and M., and is owned by the Union Land and Oil Company, the principal stockholders being residents of Georgia. Should the well prove to be as strong as it now appears to be, another one will be immediately sunk near it. The oil obtained is of a good quality of the black oil. Besides their oil and gas prospects, the company has some large beds of asphaltum that will be valuable when a railroad is built near them. The Sunset Oil Company is daily expecting machinery to arrive from the East with which they will bore for oil on their property, which is also in the western part of this county. We learn also that Hirschfeld Bros. and R. T. Norris will soon begin a well on the latter's ranch with the hope of securing oil or gas or both. This well will be only eight or nine miles from Bakersfield, between here and the Kern River canyon. Gas can now be detected escaping from the ground in that vicinity.—Kern Co. Echo.

### California Forests.

The California State Board of Forestry some time since prepared a bill providing for the better care and protection of Government forest lands in this State not suited for agriculture. The bill provides that on and after its passage the said lands shall be withdrawn from sale and entry, and shall not be alienated from the United States Government. The said lands shall then be placed under the management and control of the State Board of Forestry, who shall provide for the perpetuation and removal of the forest growth—mark such timber as may be properly cut and sell the same, provided that the said Commission shall turn into the Treasury of the United States all funds received by them for timber, fuel, privilege of pasture, hunting permits, and for any further purpose over and above the cost of maintenance of said forest lands.

Copies of this bill were sent each member of the Pacific Coast delegation, and Congressman Thompson and Senator Stanford were requested to introduce and look after it. Mr. Thompson has already introduced the bill in the House, and recently the following telegram was received by the Secretary of the Board of Forestry from Senator Stanford:

"I intend to introduce a bill of some kind, but differing materially from your proposed bill. When prepared, I will send you a copy."

**STOCKTON'S ELECTRIC ROAD.**—Hanna, Swaine & Co. have 75 men at work grading the streets preparatory to laying the rails for the electric motor road. The line will be about ten miles in length, running through the principal streets and to all the railway depots and boat landing. A company is being formed with \$500,000 capital. The road will have no wires overhead nor underneath, but the power of each car will be stored in the batteries under the seats. The construction of the cars will be the same as that of the Market-street cable cars, but they will be a trifle smaller, being 22 feet long, while the Market-street cars are 26 feet long. Several cars for the line are already in course of construction. The contractors expect to have the road completed and in running order by Sept. 1st of this year.

The coal famine in the Puget Sound district still continues. Only one company now sells to local customers, the others having orders to ship all that is mined to San Francisco. The people are, therefore, laying in stocks of cordwood and bark. Six dollars and fifty cents per ton is the price now asked in the local market, a figure never before reached.

MONO COUNTY has realized so far from the tax on sheep driven into that county the sum of \$5025.

### About Colors.

Nothing can so benefit the painter as the study to familiarize himself with the conditions of a proper contrast upon which the beauty of color in a pattern or design depends. Contrast, says a writer in the *Painters' Magazine*, is not confined to the most intense and powerful colors, but includes those modifications by which one color is enhanced by the subordination of others, or a greater prominence given it. That color may be either a pure primary or secondary, or may merely predominate as a tint in a compound. All contrasts must refer to one of the primary colors, and harmony will depend on the quantity, or intensity, of the contrast. As two of the primary colors united form a contrast to the third, so with the secondary, tertiary and other colors in which they predominate as a tone. To reduce the intensity of a simple color we must do so by mixing with it a certain portion of the colors produced by the union of the other two primaries. There are only three proper contrasts of color in nature, and all colors are modifications of these. Pure red is the most intense and perfect contrasting color to green, because neither blue nor yellow exists in its composition; and on the other hand, pure green is the most perfect contrast to red, because it is composed of yellow and blue only. When any two of the three primary colors are united together in a secondary color, they are deprived by neutralization of one-half their power; therefore in the contrast of red and green, red most strongly asserts itself. But when pure green is opposed to red, green becomes the characteristic color of the contrast, because the yellow and blue, by which the red is neutralized to a contrast, are the constituents of green, and consequently give it a species of predominance over the red. Such is the simple nature of contrast upon which the chromatic harmony solely depends.

Every proper arrangement of color must have a key, and the key must be one of the primary or secondary colors, and, either because of its intensity or as a neutralized hue, must have all other colors subordinated to it to give them their true beauty and expression.

#### Complementary Colors.

All colors have their complementaries, which add to or detract from the beauty of the adjoining colors, according to what they may be, says a writer in a cotemporary. Thus, the complementaries of red are green; blue are orange; yellow are violet. If you cut out pieces of gray paper in an ornamental form, and stick a piece on each of the three colors I have named, you will find, in a shaded light, the gray will be fully tinted by the complementaries of these colors. But you cannot lay down precise rules. An experienced artist can bring any two colors together by properly modulating them. Nothing is so charming and so refreshing to the eye as a harmonious arrangement of colors. They are "like a sweet chord of music to the sense." The hand of nature never errs, whether it brings together scarlet and crimson, as in the cactus; scarlet and purple, in the fuchsia; yellow and orange, as in the calceolaria; or the colors in the varied plumage of exotic birds, the harmony is always beautiful, ever perfect. The laws of harmonious coloring are a necessary part of the knowledge of the manufacturers of colored fabrics. I will suggest a few contrasts:

1. Black and warm brown. 2. Violet and pale green. 3. Violet and light-rose color. 4. Deep blue and golden brown. 5. Chocolate and bright blue. 6. Deep red and gray. 7. Maroon and warm green. 8. Deep blue and pink. 9. Chocolate and pea green. 10. Maroon and deep blue. 11. Claret and buff. 12. Black and warm green.

#### Curious Effects Which Colors Produce on the Human Mind.

There are some curious things in regard to the way in which the human mind is affected by colors as well as the human sight. How much or in what way animals are affected by colors is not very well understood, but the subject has been investigated enough to know that they are influenced by them, and the future will probably bring out some surprising results to the one who shall thoroughly cultivate this comparatively unexplored field of research.

#### Color Sounds.

Recent observations have developed that some minds associate colors with certain sounds. *Popular Science*, in regard to this peculiarity, says:

We are all familiar with what is termed color-blindness, and the unexpected results that sometimes attend it, but color sound is something which has received much less investigation. Some people can select and appreciate the colors of sounds, and to them the speaking of a name presents, mentally, a well-defined color or combination of colors, different names having different shades or combinations. The same name should, of course, always present the same color or combination when spoken, although, to different people, possessing the faculty, a given name or sound does not present the same characteristics. To prove the first of these two facts a list of names was prepared and the shade or color given by a lady who has this power marked against each one of the list. After several weeks the names were again read to her and the colors designated by her

marked. This course was pursued several times during a year or more, the lady not being allowed to see the results at that time. During these several experiments the only variations in the answers given were such as would be natural where there was some uncertainty in regard to terms; for example, the answer to a given name at one time might be "bluish," at another, "lead color," so what was called "straw color" might afterward be called "buff." The approach to similarity in the shades shows that the same mental picture was present, and only language was at fault. With one or two exceptions these were the only changes noted in the several trials, and the extent to which the experiments were carried warrants the belief that there was a well-defined idea of the color of words.

### Industries and Public Works.

Mr. Townshend, the Representative from Illinois, is about to introduce a bill in Congress to create a new executive department to be known as the "Department of Industries and Public Works." The promoter of the bill says with truth that the variety of interests consequent upon the development and growth of the country demands the creation of many bureaus which were not originally contemplated by the founders of the Government. In order to place them under some responsible supervision they have been apparently assigned by chance to various existing departments, without much systematic or harmonious relation, and thereby the machinery of our Government has to a considerable extent become cumbrous and incongruous. The object of the proposed new department is a consolidation of the bureaus of a cognate character which do not properly have a place in any of the existing departments. The proposed consolidation includes the following departments:

First—The Agricultural Department, which is now attached to the Interior Department.

Second—The Meteorological or Weather Bureau, which is now in the War Department.

Third—The Bureau of Labor, now in the Interior Department.

Fourth—The Improvement of Rivers and Harbors, now in the War Department.

Fifth—The Coast and Geodetic Survey, now in the Treasury Department.

Sixth—The Geological Survey, now in the Interior Department.

Seventh—The Survey of the Public Lands, now in the Interior Department.

Eighth—The System of Construction of Public Buildings, now attached to the Treasury Department.

Ninth—The Bureau of Administration of our Lighthouse System, now under the Treasury Department.

Tenth—The National Observatory, now in the Navy Department.

Eleventh—The Bureau of Patents, now under the Interior Department.

Twelfth—The Inspection of Hulls and Boilers of Steamers, now under the Treasury Department.

Thirteenth—The Interstate Commerce Commission.

Fourteenth—The Fish Commission. Thus it will be seen that these important bureaus, eminently of a scientific and industrial character, are scattered through the several departments, and such assignments are incongruous and unsystematic.

No doubt there will be opposition to this measure, but it is one which, in this, or some modified form, will be adopted before very long. There are many incongruities now apparent in the condition of affairs. The Interior and Treasury Departments now have many bureaus which have nothing really to do with that branch of the Government. In any event, Mr. Townshend's idea is worthy of consideration.

**AMADOR COAL.**—Yesterday morning as a representative of the *Record-Union* was passing along Fourth street he discovered Jud. C. Brunsie endeavoring to talk T. K. Muir to death, and stopped and entered a protest. Brunsie demurred to the interruption, claiming that they were both from Amador, and as for chinning proclivities they were pretty evenly matched. Mr. Muir is superintendent of the Sacramento and Ione Coal Co., whose mine is southeast of the town of Ione, in Amador county, about half a mile from the railroad depot. Mr. Muir is a representative citizen of that section, and expresses great faith in the outcome of Amador county. He says the coal mine of which he is the acting superintendent is owned almost exclusively by Sacramento citizens. J. M. Avery is president, Fred Muir treasurer, and C. Holland superintendent. Among other large stockholders are Chris. Green and Wm. Guttenberger. It will be four years next July since this company commenced operations. They have 130 acres and mine it continually, employing constantly upward of 20 men. The depth of the mine is 75 feet, and the depth of the coal vein from 6 to 20 feet. They mine every month from 1200 to 1500 tons of coal, which finds a ready sale. It is nearly equal to the Mount Diablo coal, and is sold for one-half the price of the latter. The people in Ione City, or at least a large number of them, use no other fuel.—*Sac. Record-Union*.

The recorder's report shows that real-estate transactions were larger in San Francisco in 1887 than in any other year in the history of the city.

## Pure Food and Medicine.

Since the days of the elders when the debasing of foods consisted chiefly of sanding the sugar and watering the vinegar in the back-room of the retail grocery, there has been most alarming progress made in adulterating and debasing nearly all materials which enter into the food of man or minister as medicine to the ousa of the illa to which flesh is heir. So vast has been the extent of this evil work and so far-reaching the application of the nefarious art, that large volumes are published setting forth adulterations as fast as discovered, and still ingenuity begotten of greed is constantly devising new abominations more apt to deceive the consumer and more difficult of detection by the expert. As an indication of vastness one need only recall the mines of white earth which are worked to supply the candy-makers and the mills for grinding soft wood and other refuse for the use of the spice-makers, and these are only items of the great debasing industry.

The problem of checking this evil has been energetically taken up in some States, Massachusetts perhaps having done most to make hard the path of greedy evil-doers. As we recently stated in the PRESS, so strict is the surveillance kept of the retail stores of foods and drugs in the old Commonwealth that the Yankee skill in adulteration has to expend itself on articles for shipment to other States, as the danger is too great on home sales. The result is that the evil goods are shipped to other States where no particular attention is paid to the matter, and we have no doubt the Pacific Coast has its full share of these bad things to eat, drink and pay for.

Judging from the experience of Massachusetts and some other States, the true way to cope with the evil is for each State to equip itself not only with good laws on the subject, but with effective penalties and rewards and other executive machinery which shall carry the laws into effect. This each State must do for itself to meet the adulteration originating within its own borders. This State work should be supplemented by effort on the part of the General Government, and this will come before the present session of Congress, urged by organized support which will be rallied at a meeting to be held at Washington on Wednesday of next week. This meeting will call the attention of Congress to the great evil, and submit for its action a national anti-adulteration bill. The bill was drafted by the Commission, approved by the National Board of Trade, and was introduced in the last Congress, but owing to departmental jealousies, it did not become a law. Public opinion has again become so strong in favor of such a law that the convention will again recommend the measure, together with whatsoever amendments may seem judicious, and will urge its passage by the Fiftyeth Congress. The proposed Act, entitled "A Bill to Prevent Adulteration of Food and Drugs," is the result of much patient research by men of talent, who undertook their work for the National Board of Trade. Although the national Act has not yet become a law, another Act, drafted by the Commission on the same lines for enactment for the several States, has become a law in New York, New Jersey, Massachusetts, and substantially in Illinois and Michigan. It is evident that an Act applying to interstate transactions and commerce with foreign countries is needed. All States are, therefore, called upon to assist in this matter, and each State, other than the above, is petitioned to pass a State law in harmony therewith.

We have received a copy of the bill which will be reported and urged at the Washington meeting next week. It provides first for the establishment of a Governmental bureau to be attached to such department of the Government as Congress may see fit and to be called the "Bureau of Adulteration." It shall have a chief officer and a corps of assistants, analysts, etc., to carry out its work, which shall be in the main to furnish incontestable proof of the quality of articles of food or medicine which may be submitted to it or which it may obtain itself for examination. This bureau will thus furnish the evidence upon which all measures of prosecution, etc., must depend. The work of the United States in prosecuting evil-doers in this line must, of course, lie within the constitutional scope of the Government, and the prevention of adulteration, as proposed by the bill, is a somewhat roundabout proceeding. Thus, we find that outside the District of Columbia and the Territories, over which, of course, the General Government has direct control, the penalties are fixed against any person or corporation which moves adulterated articles from one State to another, because interstate commerce is open to Government regulation, or imports from foreign ports to any State, because all imports are regulated by the General Government. The bill provides that any party convicted of transgression in these ways shall be fined not more than \$100 for the first offense and not more than \$500, and be imprisoned not more than one year or both, for each subsequent offense.

Other sections of the bill provide for the examination of suspected articles, and arrange for re-examination of the material at expense of the suspect, providing he is not satisfied with the first examination of the article. The selec-

tion of local analysts whose testimony can be accepted, is also provided for. The district attorneys of the United States are ordered to prosecute offenders of this class, and are paid for their services by the United States Government.

The definition of food is held to be anything which is eaten or drunk, and adulteration thereof means (a) reducing its strength, (b), debasing it by introducing inferior material, (c), debasing it by extracting any valuable part, (d), introducing any unwholesome material, (e), coloring, coating or polishing so that a base article is made to appear like the genuine. These items are all described in detail in the Act. In the case of drugs, the offense lies in selling an inferior material under the name fixed by the U. S. Pharmacopoeia or any other standard work on materia medica, or if, when sold under another name, it differs from the standard of strength, purity, or quality therein; also, if, in these reports, it falls below the professional standard for such drugs.

Provision is made for frequent publications from the Bureau of Adulteration of the results of its examinations, and these will probably be quite as useful as the prosecutions in informing the people and in making the adulterators' business unprofitable.

There are a host of ways in which such a law will be of immense value to Californians, besides protecting us as consumers. It would force bogus wine-makers out of their arts, it would reach the hordes of olive oil adulterators, who, even in our own city, we are told, are traitors to the prosperity of our State by putting up false brands of olive oil, hoping to profit by their wretched dishonesty because California is becoming known as an olive country. The Act would also supplement effectively the arrangements for pure dairy products and do good in ways innumerable. We trust the matter will commend itself to immediate action by Congress.

## The Seven Devils' Country.

The following descriptive article is taken from the Walla Walla Statesman, whose editor, Col. Frenk Parker, is an old-time prospector in these rugged mountains, and who has faith in their mineral wealth:

Seven Devils mining district is situated in the middle part of the west edge of Idaho, eight miles east of the Snake river, about 90 miles south of and up the river from Lewiston, and about 100 miles north of and down the river from Weiser station on the Oregon Short Line, at an elevation of 6000 feet, back on the high, perpendicular bluffs of the wild and weird Snake river canyon. The general formation of the country is limestone and granite, and the course of the veins northwest and southeast. There are a number of locations in the district on good, strong veins, that run from 8 to 12 feet wide, some of them averaging the whole width, 50 per cent copper, 30 ounces silver and \$12 gold to the ton. Some of the locations—the Helena, White Monument and Peacock—were discovered 20 years ago, and are now patented. On the Peacock is said to be over 120,000 tons of high-grade ore in sight. Last year Lockwood and Frint sold the Mt. Queen and Blue Jacket to Bristow and Kleinsmith of Butte City, Montana, Ty., and Allen & Lewis of Portland, Oregon, for \$40,000. Steele & Co. of Portland own the Alaska and Deatur locations. The Helena Mining Co. own the Peacock, White Monument and Helena. All these locations and some others are fairly well developed, being opened by 100 feet and over shafts and drifts. The camp, says Pat. Hickey, who kindly furnished this information, will make the largest and richest copper camp in the world when a railroad is built to it and the mines worked. There is a good practical route for a railroad from Weiser up Weiser river 40 miles, on a grade not to exceed 20 feet to the mile, then 16 miles across a low divide on to Crooked river seven miles, on across a rolling prairie country six miles to Bear creek, up which it follows three miles, at a grade about 25 feet to the mile, and through an open, timbered, hilly country at about 30 feet rise to the mile, to the camp of Annie Bristow—named after the first lady that visited the country—in the center of the Seven Devils district.

The Union Pacific Company last summer ran a survey line for a railroad route from Weiser up Weiser river, across on to Little Salmon, down said stream to Big Salmon and on down to the Snake.

All up the Weiser river are little valleys in which are thousands of acres of fine agricultural land, and the surrounding country affords excellent stock ranges.

On the Weiser is the Middle valley, 4 by 10 miles in extent; Salubria valley, 5 by 17 miles; Council, 5 by 8 miles; Indian, 4 by 6 miles, and Hornet valley, 1 by 16 miles in extent. In these valleys and surrounding country the winters are mild and cattle run out and do well all winter without having to be fed.

Among the other promising camps is the No Business Canyon, situated about 20 miles south of the Seven Devils. Ed. Ryan of Boise City, W. Walker of Hornet valley, and another party, located last summer in this district a 20-foot vein, running northwest-southeast, in porphyry quartzite, which averages on the surface 30 ounces of silver and \$17 in gold.

The building for the Ramona Indian Girls' School at Santa Fe, N. M., commemorating Helen Hunt Jackson, will cost \$30,000.

## The Mines and Miners.

BY PEDRO CASTERA.

(Continued from issue of Jan. 7th.)

Translated for the Press from *El Minero Mexicano* by M. N. M.

## Was He Conscious of His Merit?

Perhaps not, but he evidently was of his vigor, of his intrepidity, of his nerves of steel, and of his indomitable will. The act of a fool, some will say. But who? Only the mean-spirited, the stupid, and the imbeciles. A dense smoke and suffocating heat was filling the bottom of the shaft. The air was rarified and charged with gases of sulphur and niter. The stones were falling thick around him. With the blood dripping from his wounds, and almost asphyxiated by the inhalation of the irrepressible gases, he stood there undaunted awaiting the remaining shots from the barrenos. The last three barrenos exploded with but a single echo, and even the respaldos, or walls, trembled under the disruption that took place. Among the auditors at the mouth of the shaft there was profound silence. Instantly the voice of the *pegador*, serene and more sonorous than ever, was heard crying out—*En los planes de Santa Rosa y—¡sin novedad!* Death often respects the valiant, and it had respected him. The enthusiasm was indescribable. The cable was lowered with a number of barreteros, and soon after appeared the blackened and blood-stained hero. The sun was sinking low in the distant west. Indubitably—upon such noble souls—in the blue of the skies—God looks down.

## In the Midst of the Abyes.

I do not recollect whether the actual occurrence, which I am now about to relate, took place in the mine de la Cata, or in the Rayas; both are in Guanajuato, and, if the reader will permit, we will refer it to the last. The general or usual shaft of the mine of Rayas, which measures 900 varas in depth and 16 in diameter, is classified by its dimensions as the first in the world. At the epoch to which we allude, they were working eight whims or windlasses in that tiro to drain the mine. The administrador of this mine was Don Rafael H—, about 30 years of age, pale, spare and feeble in appearance, but in whose look shone the flame of energy and the radiant spark of intelligence. The cajonero of the shaft was named Jose. He was a robust fellow, but with the hungry, suspicious and unquiet look of the jackal. The ropes for descending, the cables for drainage, the depot and everything pertaining to the shaft and its various services, were subject to his order and under his immediate direction. Among the *cosas* which the administrador possessed was a very pretty sweetheart of exquisite form, who had turned the head of the cajonero Jose, who, for a long time, had been simulating caresses and throwing side-glances at her. The girl, however, never failed to overwhelm him with disdain, and this is readily understood when it is known that between administrators and cajoneros the distance is as great as that between the mistress of the house and her maid-servant. The muchacha had declared herself a strong fortress and Jose her besieger; but the latter, tired of besieging, made, one day, an assault, which cost him

## A Good Cudgeling from the Administrador.

Jose submitted to the caning, but he swore to his master that he was going to have revenge. Don Rafael, however, despised such threats, and, as the attempted offense could not be regarded as one against discipline, the cajonero continued to hold his place. Some time after, the girl fled with a cavalry official, thus giving a proof of her constancy and invincibility. One morning Jose entered hurriedly into the room of the administrador, while he was sleeping, and told him that in the mine many shouts, songs and vivas were heard, and that surely they had found a bonanza. This word produces more effect on the imagination of the miners than all the cataclysmes and earthquakes together, and hence it was that Don Rafael, without waiting for the proper report, ran to the shaft, tied about his waist a sort of *mecapal*, to which has been given the name *caballo* (horse), fastened himself to a cable, and, suspending himself above that vast abyee, said to the cajonero, *¡arrea!* The horse of one of the whime began to move, and the cable being arranged, Don Rafael, with a lighted *hacha* (torch) in one hand and holding with the other to the cable, began to descend slowly into that black hole without observing that there was no noise in the mine, and that the cajonero had smiled in a sinister manner.

## When He Saw Him Begin to Descend.

Danger not only awakens the instinct, but quickens it, and the administrador, seeing himself suspended in the midst of the abyee, suddenly remembered the threats of Jose, comprehended that he had acted without due reflection, that his life was really on a thread, and that the cajonero could cut it at his pleasure. The torch showed the drops of cold sweat that were bathing his forehead, the convulsive trembling of his limbs, and the look of anguish that he fixed so quickly on the depth and on the lateral walls of the shaft. He had descended proba-

bly 100 varas, when the movement of the rope was stopped. Don Rafael felt a chill which penetrated to his marrow and seemed to congeal his blood. He realized it all. Jose was going to cut the cable from which he was suspended, and he would reach the surface of the water with greater velocity than that of a ball from a cannon. He glanced despairingly at the nearest wall, and was able to discover, fastened in it, a thick piece of wood that projected from the vertical edge one-half of a vara or a little more. To throw the *lea* to the bottom of the tiro, untie the *oaballo* from the rope and clutch with both hands the log, which appeared to him only a splinter, required but a few seconds, and he had hardly done so when he heard the descent of the rope and soon afterward the noise made by the fall of it in the water. The scream of terror which he emitted was replied to at the mouth of the tiro by a loud and sarcastic laugh, which, in spite of him, made him tremble.

## Then Profound Silence Reigned

And he remained submerged in the darkness, seated on that fragment of wood and wavering above the awful deep which was attracting him and which the least negligence would precipitate him into. The silence was broken only by the creaking of the ropes, by the drops of water from the drainage buckets, sometimes by the deafening report of the barrenos and by the echo of the hammers of the barrenadores—but soon, in the midst of those several noises, he distinguished one that made his hair stand on end from horror. The bit of wood on which he was seated began to crack. The air, the water and the passing years had rotted it, and it was giving way under the weight of his body. So far from being saved, as he had imagined, he had only managed to prolong his agony. Then he tried to hold to the wall of the shaft, but his nails were torn against the rock and his bleeding hands availed nothing in lessening his weight. Now he heard a mournful song which was coming from the depths of the shaft—it was the *alabado* which the miners sing when they know that a brother has died; *ayes* of anguish and despair which combine with complaints and sobs, forming in this way a melody sweetly sad and profoundly touching. The news of the death of the administrador had reached the barreneros and all the people of the mine, and they were singing the *alabado*, supplicating God for him. That song came to him like the psalmody at the threshold of the grave, a psalm of grief, foreboding the pangs of death, and that tomb in which he was about to be precipitated. The singing ceased, and to the rustling of the calabrotes that were moving up and down end to the sounds of the drops that were falling, was added that sinister crackling of the wood, which, like a pendulum, was marking his agony and the time of his departure. The frail support began to incline—Don Rafael held desperately to the rock. The blood rushed to his head and his temples throbbed painfully. In a few seconds, which to him appeared centuries, he heard the voices of the exulting miners at the mouth of the shaft.

(To be Continued.)

COAL AND GAS IN YUBA CO.—A dispatch dated Marysville, Jan. 12th, says: Several years ago Eli Davis, ex-supervisor of Sutter county, prospected for coal on his ranch in the region of The Buttes and was partially successful, but did not prosecute his discovery. At that time a small flow of natural gas was discovered coming from the ground when at the depth of 40 feet. Yesterday Mr. Davis bored on his place, near the town of Sutter City, and has discovered a strong flow of natural gas which he will immediately develop. He now says that experts will be employed to look for coal deposits.

RICH MINES SOLD.—A syndicate of wealthy New York capitalists have acquired the extensive smelters, stamp-mill and other reduction machinery located near Albuquerque, owned by the San Pedro Company. The new company will organize with a capital stock of \$1,000,000, and intend to enlarge the already extensive plant at the mines. The new company will be known as the New Mexico Milling and Smelting Company. These mines have been in litigation for several years past.

GOLD IN BOGOTA.—Las Noticias of Bogota, U. S. of Colombia, states that: "The gold which is now being dug out of the ancient cemeteeie (huacas) at Hilandia and other places near Pereira, in Cauca, has led more than 1000 workmen to flock to that spot, and a town has sprung up there within the past four years which now contains more than 5000 inhabitants."

LIGHTNING-RODS USELESS (?)—The *Electric Review* says that the uselessness of the lightning-rod is becoming so generally understood that the agents find their vocation a trying one. Fewer and fewer rods are manufactured each year, and the day will come when a lightning-rod on a house will be regarded in the same light as a horseshoe over a man's door.

THE San Bernardino Board of Trustees has accepted plans for a sewerage system for the entire city. The cost is nearly \$132,000. Waste land will be secured for a sewerage farm, in which the sewer system will empty, and the material be used as a fertilizer.

## Passing Events.

For a week or more past we have had the coldest weather ever experienced in California. The cold wave has extended over the whole State, and in the mountainous regions has been felt severely. While California has had no such severe weather as the States and Territories east and north, great discomfort and inconvenience has resulted, since we here were unprepared for anything of the kind.

Most of the ditches and other sources of water supply in the mining regions have been frozen up of late, and many mills have been compelled to close down. At some mines, also, operations have been suspended owing to the cold weather. Great difficulty has been experienced in keeping the various railroad lines open.

In another column attention is called to the shipments of silver-lead ores into this country from Mexico, a very important matter to our lead miners, since these ores, owing to their silver contents, come in free of duty as silver ores. It is a subject which the lead miners will do well to pay some attention to.

There is very little news of moment from the mines. The cold weather prevailing of late has retarded operations considerably nearly everywhere.

The Northern Pacific railroad charges twice as much for carrying ores from Coeur d'Alene to Portland, Ogn., as it does to Wickes, Montana, and the Portland people do not like it. The railroad officers say the reason is "they have empty cars going East."

## The Duty on Lead and Lead-Bearing Ores.

To discuss the effect of reduced duties on imported wool, raisins or other agricultural staples would be foreign to the province of this paper. Leaving, therefore, that branch of the subject to be looked after by that portion of the press to which it properly belongs, it becomes pertinent for us to consider the consequences likely to result from placing the single article of lead or lead ore on the free list.

In the first place, it may be observed that we operate in this country no mines solely for the lead they yield. Our plumbiferous ores all carry more or less silver, generally enough to cover the cost of their extraction and subsequent treatment, and very often a great deal more. But, while this is the case, there occur throughout the Pacific States and Territories immense quantities of lead-silver ores, too poor in silver to warrant their being handled for that metal alone. If from any cause the price of lead were to depreciate below the point of profitable production, this large class of ores becoming valueless would be neglected; whence there would ensue a large curtailment not only of the product of lead, but also of silver; a result that, while it has not been wholly overlooked, has, it seems to us, hardly received the attention it deserves.

A large proportion of the so-called silver mines of Idaho, Colorado, Utah and Montana would be obliged to suspend operations but for the lead they yield. Destroy the market for lead and they would all have to shut down and so remain until the market for that metal was restored. Of course, many of these mines might be kept running by reducing the wages of employees to very low figures, were that practicable. In any event there would be left to the owners only the alternative of closing their mines or cutting down wages to the European or the Mexican standard, that is to say, about one-third the present rates. It must not be forgotten that there is, throughout all these countries, a sharp competition in the lead-producing business; so much so that many companies, during the past 10 or 12 years, have, by reason of the prevailing low prices, been forced to retire from the field, while others, possessed of more ample means, have been able to keep on and finally realize a fair profit only by storing their product and awaiting a better market. Pursuing this policy, the Richmond Consolidated Company have at times had whole shiploads of lead piled up at their mine in Eureka, Nev. The truth is, our lead producers, even with the protection afforded them by the present tariff, have barely been able to live; without such protection the most of them must suffer industrial and financial death.

As regards the admission of lead ores duty free, we have much to fear from our neighbor, Mexico, which, besides an incredible wealth of these ores, and her dangerous proximity, is a country of excessively cheap labor, the wages of miners being even less there than they are in the Old World. Through the facilities afforded by railroad transportation, the influx of these ores from that quarter is beginning to be large, as they escape the existing duty imposed on lead ores by being classed as silver ores. Argentiferous galena, if it contain as much as 30 ounces of silver, is passed through the custom-house at Paso del Norte, and presumably at other points of entry, duty free, being then accounted silver ore, even though the lead values may greatly preponderate. If the ore in its original state contains too little silver to rank as a silver ore, enough of the latter of a higher grade is added to bring the whole up to the requisite standard, and thus insure its entry duty free. Under this ruling of our custom officials, Mexican lead ores are practically placed on the free list.

A writer in the *Mining Review* calculates that as much as 2000 tons of this Mexican ore crosses the border every month, an estimate that appears to be fully warranted by the returns of the Bureau of Mining Statistics, which establish that ore importations from Mexico have nearly doubled every year since the completion of the Central railroad which traverses the great lead-bearing districts of Chihuahua, and in like manner crosses or runs near other plumbiferous sections of the Republic. Should these importations of Mexican lead ore be suffered to go on increasing at the rate they have been doing for the past few years, the injury

they must inflict on the lead industry in this country will be very serious, as the whole United States produces less than 12,000 tons of that metal per month. Clearly, home interest demands not only that the present duty on lead and lead ores be retained, but that the intent of this law be carried out in the matter of the importation of these lead-bearing ores from Mexico.

## Regulating the Working of the Mines.

While mining in the United States has grown to be a great and permanent industry, the business with us in some of its branches, especially those that relate to mining for the precious metals, is comparatively new. But it is in all its branches old enough to have been subjected to a somewhat more rigid system of public supervision than has yet been extended to it, these engaged in the business, whether private individuals or incorporated companies, having been left to prosecute it with but little interference on the part of the law-making power.

In view of the wasteful manner in which many of our mineral deposits are known to be worked, and the serious accidents that are constantly occurring, it may well be questioned if something like a code of mine regulations should not be enacted by the Legislatures of those States and Territories in which this business is largely carried on, provision being made for the appointment of inspectors to see that mining operations were being properly conducted, and that these regulations were properly observed. The rules in force in old mining countries, changed to suit circumstances, might, no doubt, be by us adopted to advantage, these being the results of long experience and having been tested by practical trial. These regulations should look not only to protecting the miner in life and limb, but also to preserving his health and insuring his comfort.

It might perhaps be best for the Legislature to appoint, or empower the Governor to appoint, a committee to prepare such code, care being taken, of course, that none but thoroughly competent men be selected for the service.

There are many reasons why mining, more than most other pursuits, calls for helpful legislation—many reasons why special precautions should be taken and special safeguards be provided in its behalf. The business, besides being somewhat new to our people, is inherently difficult and dangerous. The miner has to deal much with unstable elements and unknown quantities; to contend with water, foul air and deadly gases, doing most of his work at great depths, and also in the dark. If anything can be done to ameliorate his condition and insure for his calling larger and more certain results, it is important both for the miner and the general public that it should be done.

THAT ARIZONA GOLD MINE.—A dispatch from Prescott, A. T., dated Jan. 17th, says: Another immensely rich discovery was made yesterday in the Howard mine near here, which is fully as rich as the pocket discovery in the same mine some months ago. A gentleman who has just returned from the mine says that this discovery is, if indications can be relied on, a vein and not a pocket, as the first discovery was. After the discovery of the rich pocket, some time ago, the value of the ore decreased, but never less than \$30 per ton. This is a continuation of the vein, and at the bottom of the 40-foot shaft, and if it continues its fortunate owners will rival in wealth Gould and Vanderbilt.

A COLD PLUNGE.—The miners who are at work in the heated lower levels of our mines feel as though dumped down at the North Pole when landed in open air. The cold shrivels them like shrimps. A dash from 100 degrees above zero to an atmosphere almost down to zero is a big change to be made in the space of about three minutes. But that the men are pretty well prepared for the change and have a good supply of warm clothing on hand in their changing-rooms, the doctors would have their hands full of pneumonia patients.—*Virginia Enterprise*.

TWENTY tons of clean copper is now the daily product of the Copper Queen mine at Bisbee, Arizona.

## The Future of the Copper Industry.

The high prices now prevailing for copper are likely to greatly stimulate the production of that metal the world over. While such is the case, the increment on the Pacific Coast is likely to be immediate and more marked than elsewhere, because here the deposits of that ore are exceptionally numerous and of more than average high grade, and because many of them, being already opened and equipped with plant, are in condition, or can soon be put in condition for active production.

We have, on this coast, especially in California and Arizona, many mines so developed and outfitted, and which suspended operations simply because the price of copper had dropped to a figure too low to warrant their continuance. Of these companies, some have already resumed work, while others are making preparations and will soon do so. It may be expected, therefore, that the output of copper will, in a short time, reach large dimensions, bringing about again, after a time, lower prices.

The probability of such result has caused some to question the policy of such hasty and general resumption of production, citing our experience in quicksilver mining as affording warrant for their apprehensions. But that experience can hardly serve as a precedent in copper mining, the nature and conditions of the two industries being so little alike.

In the case of quicksilver the deposits, at the time the then prevailing high prices so stimulated mining for that metal, were with few exceptions in a virgin state, being undeveloped and without plan. A great deal of money had therefore to be expended before these deposits could be brought into a condition of active production. With our copper mines, as before remarked, the case is quite different. They are for the most part ready to resume operations or can do so at short notice and with very little preliminary expenditure.

Then, in the case of copper, if prices decline consumption is increased, enlarging the demand for the metal and tending to maintain the market. With quicksilver it is otherwise; being confined to a few uses, a reduction of price does not tend to much increase the consumption of that metal, and so the producer is left with nothing to compensate him for such reduction.

WATER GAS.—In his annual report Mr. Joseph Crockett, the president of the San Francisco Gaslight Co., says that besides improvements made during the past year the Potrero works are yet to receive the addition of the Springer patent for water gas, which will be in running order by July 1st, with a capacity for furnishing 2,000,000 feet of water gas every 24 hours. This improvement, including the cost of the company's seven-tenths' interest in the patent, will foot up a total expense of \$95,000. President Crockett expresses great faith in the project. The remaining three-tenths' interest in the patent belong to the other local company, and the value of the entire patent is estimated at \$50,000. President Crockett says that the past is the most prosperous year the company has had since 1880. During the year the company employed permanently and temporarily 445 men, and the entire payroll aggregated \$385,826.

CRESTED BUTTE COAL.—Edward E. Chever of this city, now visiting Colorado, has sent to the State Mining Bureau from Crested Butte, Gunnison county, Colorado, a splendid specimen of anthracite coal. He writes us that the U. S. Mint at San Francisco is now using this coal. Mr. Chever had to pay \$15 express charges on the 100-pound lump of coal from Denver to S. F., but he writes: "We may hope for a time when the fruit and wines of California may supply the wants of Colorado and her deposits of fuel furnish return freights in exchange. There were 16,242 cars of coal, coke and ore shipped from Crested Butte during the past year."

THE verdict of the jury in the patent boiler-furnace suit of E. W. Tucker vs. John Birmingham in the United States Circuit Court was in favor of plaintiff, with damages assessed at \$200.

THE Mexicans are objecting to Americans coming into their territory, much as the Americans object to the Chinese coming to this country.

### Electro-Magnetic Apparatus for Separating Ores.

Jacob Kessler of Ober Lahnelein, Prussia, has patented in Germany and in this country an improved electro-magnetic machine for separating particles of iron from ore. The invention consists in the combination, with a drum which is magnetized by an electro-magnet connected with a suitable battery or dynamo-electric machine, of an endless belt or carrier passed around the drum, and provided with pins, which are passed through the pulverized ore, the particles of iron adhering to the pins which are magnetized, and which pins are then demagnetized, causing the particles of iron to drop from them.

In the accompanying drawings, Fig. 1 represents a longitudinal sectional elevation of the improved electro-magnetic machine for separating ores. Fig. 2 is a sectional plan view. Fig. 3 is a face view of one of the endless carriers or belts carrying the pins, and Fig. 4 is a cross-sectional view of a modification of the machine. Similar letters of reference indicate corresponding parts.

On a suitable shaft the spider arms or frames, *f*, preferably made of brass, are fastened, and on the same the cylinder, *e*, made of sheet or cast iron, is fixed, which cylinder is surrounded at its middle or at the ends by an insulated wire coil, *h*, forming an electro-magnet, the ends of the coil being connected with a battery or dynamo-electric machine, the coil being fixed and the drum or cylinder revolving in the same. At the sides of the coil endless belts, *K*, are passed over the drum, *e*, and over a wooden roller, *m*, at some distance from the drum, *e*. The endless belts consist of the straps, *s*, united by transverse strips, *k*, of metal, from the outer sides of which the iron pins or pegs, *k*, project, as shown in Fig. 3.

For the purpose of preventing the magnetization of the strips *K* after they have been passed over the drum, some of the strips *k*, at suitable intervals, are made of brass.

The pulverized ore is put into a hopper, *d*, having an inclined bottom, at the lower edge of which the sliding door *o* is provided, and below the door a gutter, *n*, is arranged, in which an agitator, *p*, is mounted to revolve, this agitator being driven from the shaft of the drum *e*. The agitator, *p*, throws the pulverized ore from the gutter into a guide, *r*, which is arranged in close proximity to the endless belts *K*, so that the pins *k* of the belt pass into the pulverized ore in the guide *r*. An inclined partition, *q*, is held adjustably below the drum *e*. The pins *k* are magnetized as they pass over the drum *e*, and as they pass through the pulverized ore attract all the particles of ore, etc. The pulverized ore drops into the partition *q*, and slides over the same into the compartment *z*, whereas the particles of ore that adhere to the pins *k* are carried over the top of the partition *q* and drop into the compartment *x* as soon as the pins lose their magnetism, which takes a greater or less distance from the drum *e*. The partition *q* is so adjusted that its upper edge is near to the point where the pins begin to lose their magnetism.

In the construction shown in Fig. 4 the endless belts are replaced by a brass ring or roller, *t*, from which pins *k* project, said ring resting on the drum *e* and on the wooden roller *u*. For smaller machines the pine *k* may be replaced by permanent magnets, and in these machines the drum *e* and the wire coil forming the electro-magnet on the same may be dispensed with. The operation is similar to that of the machine shown in Fig. 1. If desired, the roller *t* may be provided with an axle in place of resting on the drum *e*. This apparatus differs in several features from those formerly made to accomplish the purpose.

The severe and unusual cold on Mount Hamilton has delayed the work of completion of the Lick Observatory. The snow has been growing deeper and is now fully two feet on a level, and the weather is intensely cold. Saturday night the thermometer recorded 6°. The lowest temperature previously recorded on the mountain since the observatory work began was 13°.

The Walla Walla Statesman states that the nickel mine discovered six miles south of Rye valley yields from 40 to 100 pounds of nickel to the ton of ore. The ledge is very wide, fully 50 feet between walls at a depth of 100 feet,

THE LATE W. W. HANSCOM.—On Monday last W. W. Hanscom, the well-known mechanical engineer of this city, died suddenly from congestion of the lungs. Mr. Hanscom was formerly one of the proprietors of the Etna Iron Works, and also started the Hope Iron Works at the Potrero, being the first of

matters connected with his profession. He has contributed more or less to the press and to the proceedings of the societies to which he belonged.

OUR MINING REVIEW.—The next number of the MINING AND SCIENTIFIC PRESS will contain

Sectional Elevation of Electro-Magnetic Machine.

Sectional Plan.

Face View of Endless Carrier.

Cross Section of Modification.

### ELECTRO-MAGNETIC APPARATUS FOR SEPARATING ORES.

the foundrymen to move in that direction. Of late years he has devoted much time to cable railroads and railroad brakes. For a year or more past he has been working on an air-brake system, which was satisfactorily tested on the Donahue road. Mr. Hanscom was an old resident of California and was the second son of Naval Constructor Hanscom, who was, in Farragut's time, stationed at Mare Island Navy-Yard. Mr. Hanscom was an educated mechanical engineer, an inventor and a student of

a review of the mining industry for 1887. It will comprise a large amount of statistical information concerning the mining interests of the Pacific Coast States and Territories. The whole will appear in a condensed form and be suitable for reference. The number will be one which will be valuable for all who are interested in mining matters.

THERE are three 60-ton stacks in blast at the mines of the Arizona Copper Co.

### Pectolite in California.

[A paper by H. G. HANES, read at the meeting of the San Francisco Microscopical Society Jan. 11th, and furnished for publication in the MINING AND SCIENTIFIC PRESS.]

I have the pleasure this evening to exhibit a mineral from a new California locality. This very interesting mineral is pectolite, a hydrous silicate of lime and soda. When pure it has the following composition:

Silica.....	52.5
Lime.....	36.1
Soda.....	8.0
Water.....	3.4
Total.....	100.00

As generally found, it is impure from the accidental presence of other substances in small proportions, as potash, alumina, magnesia, fluorine and oxides of iron and manganese, but these may be regarded as foreign to the composition of the mineral.

The various published analyses of pectolite differ very considerably, as do also the hardness and specific gravity.

Alumina is generally present in varying proportions from a trace to as much as five per cent.

There are several varieties of this mineral to which special names have been given as follows: Osmelite, phonolith, ratholite, stellite, wollastonite and walkerite.

Pectolite was first discovered and described by Von Kobel in 1823, who gave it the name "pektolith," derived from two words, Greek and Latin, signifying a comb and a stone, suggested by its peculiar structure and appearance. The first specimens were found on Mount Baldo, near Verona, South Tyrol, Austrian Italy. It was associated with natrolite, a mineral resembling it, except that lime is replaced by alumina, and the proportions of the other constituents differ.

Pectolite is rather a rare mineral, having been heretofore found only at the above locality, at Mount Monzoni, also in Tyrol, at Storö on the Isle of Skye, at Kilsyth and other localities in Scotland, at Wolfstein, Rhenish Bavaria, on Isle Royale, Lake Superior, at Bergen Hill, New Jersey, and recently at several localities in California.

The variety osmelite is found at Wolfstein. It is columnar and radiated; color, grayish-white to yellowish-gray. It has been proved by analysis to be identical with pectolite.

Stellite was first found and named by Thompson, near Kilsyth, Scotland. It is described as being tough, and resembling asbestos or nemalite, but radiating from several centers; some divergent fibers afterward found at Ayrshire, Scotland, are a yard in length.

This variety has since been found at Bergen Hill, New Jersey, which is now a famous locality. The radiated appearance of this variety suggested the name stellite; from *Stella*, a star.

Wollastonite is often confounded with pectolite, but it is entirely a different mineral, being a silicate of lime without soda, and is nearly anhydrous.

Walkerite is a name given to a mineral found near Edinburgh, Scotland, in radiating and interlacing fibers, of a cream color; being supposed to be a new species, it was named after Dr. Walker, an English mineralogist, but more careful study and analysis show it to be a variety of pectolite.

The first notice of pectolite in California that I am aware of appears in the Fourth Annual Report of the State Mineralogist, where Mr. C. H. Aaron is credited with finding a single (doubtful) specimen in a boulder at the foot of the White mountains in Mono county.

In the early part of 1887 a beautiful, translucent, nearly white rock, was discovered in Tehama county, in township 25 north and range 7 west. It was seen and examined by Prof. Wm. P. Blake, who was in the State at that time, and was pronounced pectolite by him. He was of the opinion that it would prove a valuable ornamental stone. To test its value as such, a sample was given to Mr. Mannel Laine, an expert lapidary of this city, who sliced and polished the specimens I have brought this evening to show you. It proved to be rather a pretty stone, resembling some of the Chinese jades. It takes a high polish but lacks character. It is no way more beautiful than aragonite, and is much more difficult and costly to work. Mr. Laine thinks there is no place in the catalogue of semi-precious or ornamental

(Continued on page 44.)

## MECHANICAL PROGRESS.

## Changes in the Fiber of Iron which it is Impossible to Detect.

The numerous accidents which have occurred during the past few years in railroading have been made the matter of most serious study by both engineers and mechanics. It appears that a large proportion seem to have occurred by reason of some unsuspected defect in the iron of the rails or wheels or in that of bridges. This defect is generally supposed to have been induced by some changes in the fiber of the iron after it has been put in its place. An exchange comments upon this matter as follows:

Crystallization in the material of iron bridges is an element of danger now so well recognized that the Pennsylvania Railroad Company has adopted the definite policy of substituting stone for iron bridges, and the same plan is being followed by other railroad companies.

The lifetimes of an iron bridge is from 20 to 25 years, and constant care is necessary to insure its safety. The Ashtabula bridge was 13 years old, and at the time it fell beneath the weight of two engines and a heavy express train the theory was commonly advanced that crystallization had impaired its original strength. The two great moving causes of crystallization are vibration and the hammer-blow of the locomotive, which gradually, by repeated impact, turn the fiber of iron or steel into a mass of crystals, needing only some unusual pressure or blow to cause them to break apart. Add to this the oscillation caused by the passage of trains at a high rate of speed, and it will be seen that an iron bridge is exposed to peculiar perils, which can only be guarded against by rigid inspection and constant renewals.

Crystallization was one of the several theories advanced by Park Benjamin, a New York engineer, to account for the Tay bridge accident. He said: "General indications go to show that the cause must be sought in an abnormal condition of the structure, or rather one which did not enter into the calculations of the builders. Such a condition would be the deterioration of the metal by its change from a fibrous to a crystalline state under repeated vibration. That this occurs in railway bridges has been vigorously disputed by many well-known engineers. On the other hand, many examples are quoted by different authorities to support the theory. Apropos to this particular accident, a distinguished French engineer and iron founder, now in this country, informs us that he has known bars of iron made by himself from Scotch pig to change from a tough fibrous to a brittle crystalline structure in traveling by rail only from the north of France to Paris. This is, of course, an extreme instance."

"Again, recent research has demonstrated that because a structure withstands a large quiescent load that fact is little proof of stability under repeated shocks and vibrations. Metals are believed to have a 'life.' A bar, for example, may stand a million vibrations and break down at the million and first, and yet the last shock may be lighter than preceding ones. Attempts, however, to reduce this law to practical application have elicited an abundance of conflicting evidence; but, nevertheless, it is well settled that in no department of mechanics is an extended course of actual experimenting more urgently needed or of graver public importance."

The strength of the Tay bridge at the time of its building was pronounced perhaps the most remarkable of any in the world. *Engineering*, a British magazine, speaking of its test, when five engines, weighing 360 tons, were placed on a single span, said: "The result is the complete establishment of this fact (so important to the public) that this bridge is strong out of all proportion to its possible necessities. As a matter of fact, the load which the structure is calculated to carry is six times greater than that to which it was subjected."

And yet this great bridge, which cost \$1,750,000, collapsed within a few months after it was finished, the accident being the only one in all railroad history in which no survivor lived to tell the tale.

The theory of crystallization put forward at the time of the Ashtabula bridge disaster is now accepted as accounting for many railroad accidents, and seems peculiarly applicable to the fall of the Bussey bridge. Vibrations and hammer blows would seem to have crystallized some portions of the structure and prepared it for a fall when at last the "life" of a girder had been exhausted and it broke beneath the engine's thumping driving wheels.

## Steel Tempers.

The number of tempers to steel is infinite, but the following is a list of the most useful:

Razor temper ( $1\frac{1}{2}$  per cent carbon).—This steel is so easily burnt by being overheated that it can only be placed in the hands of a very skillful workman. When properly heated it will do twice the work of ordinary tool steel for turning chilled rolls, etc.

Saw-file temper ( $1\frac{1}{2}$  per cent carbon).—This steel requires careful treatment, and, although it will stand more fire than razor steel, should not be heated above a cherry-red.

Tool temper ( $1\frac{1}{2}$  per cent carbon).—The most useful temper for turning tools, drills, planing-machine tools in the hands of ordinary work-

men. It is possible to weld cast steel of this temper, but only with the greatest care and skill.

Spindle temper ( $1\frac{1}{2}$  per cent carbon).—A very useful temper for circular cutters, very large turning tools, taps, screwing dies, etc. This temper requires considerable care in welding.

Chisel temper (1 per cent carbon).—An extremely useful temper, combining as it does great toughness in an unhardened state with the capacity of hardening at a low heat. It is consequently well adapted for tools when the unhardened part is required to stand the blow of a hammer without snipping, but where a hard cutting edge is required, such as cold chisels, hot sets, etc.

Set temper ( $\frac{3}{4}$  per cent carbon).—This temper is adapted for tools where the chief punishment is on the unhardened part, such as cold sets, which have to stand the blows of a very heavy hammer.

Die temper ( $\frac{3}{4}$  per cent carbon).—The most suitable temper for tools where the surface is only required to be hard, and where its capacity to withstand great pressure is of importance, such as stamping and pressing dies, boiler cups, etc. Both the last two tempers may easily be welded by a mechanic accustomed to weld steel.

**IMPORTANT IMPROVEMENT IN DOOR LOCKS.**—An important departure in door-lock furniture has been made by Mr. Abraham Wilks, Bloxwich, England, which overcomes the ever-recurring difficulty of loose door-knobs. The necessity for screwing the knobs on to the spindle is wholly obviated by the circumstances that the spindle is made in two equal parts, being split longitudinally, and to each half is fixed the knob by being cast in, hard soldered, or screw riveted. On the end of one of the spindles opposite to where the knob is fixed is a series of teeth after the manner of a blind-ratchet, and at the opposite end of the other spindle a tough laminar spring, which is riveted on, projects from underneath the knob, which, when the two halves are passed through the door, fixes itself into the teeth on the corresponding half, and the spindle being pressed home at once becomes immovably fixed. No treatment can wrench off the knobs, and the maker and the patentee are confident that they have effectually overcome a constantly recurring difficulty. The spindles and the spring are of steel.

**TEXTILE MACHINERY IN JAPAN.**—No one can read the reports of Her Majesty's consuls, remarks the *Textile (Eng.) Recorder*, without being struck with the opportunities that are presenting themselves in countries hitherto known as consumers of manufactured goods only, for textile machinery to do a large and profitable business. This at the present time is especially the case with Japan, and makers of textile machinery and appliances of every description should at once devote special attention to the capabilities of that country for trade. Much has been written respecting German competition with our textile manufacturers in Japan; but after all, while this competition must not be ignored, it has not yet materially affected our trade. There are, however, competitors far more dangerous than the Germans—even the Japanese themselves. In the limited space of a short article it is not possible to enter into details, and two or three facts must suffice to justify and corroborate the assertion.

**NEW INVENTION IN CALICO PRINTING.**—A correspondent writes to the *British Mercantile Gazette*: "The 'simultaneous' process of color printing promises to entirely revolutionize some classes of calico, velvet, and velveteen printing, and also the printing of advertisements in colors. The novel character of the 'simultaneous' process will be at once understood when I mention that by it, if required, 1000 shades could be printed off at one impression. Instead of using engraved rollers as in ordinary calico printing, or stones, as in the case of colored advertisements, the designs of pictures are 'built up' in a case of solid colors specially prepared, somewhat after the style of mosaic work. A portion is then cut or sliced off about an inch in thickness, and this wrapped round a cylinder, and the composition has only to be kept moist, and any number of impressions can be printed off on calico, velvet, or velveteen, the colors being thoroughly 'fast.'"

**A PROTECTING DEVICE.**—A device for protecting factory operatives from accident, by being caught by swiftly running wheels and shafts, has been devised by a New Haven man. It consists in winding shafts between pulleys with strings, spirally and rather loose, and then inclosing the shaft in zinc or tin or other metal cylinders. The strings simply prevent any noise from contact of the shaft with the metallic cylindrical jacket. Should a woman get caught by the hair, it would begin to wind up on the jacket, which would instantly stop its motion, leaving the shaft inside to revolve, but without doing harm to whoever might be caught.

**AN AIR METER.**—The Lowe Manufacturing Co., Norristown, Pa., offers \$10,000 for any satisfactory invention of a meter that will correctly register atmospheric air, from a holder under a pressure varying from one-eighth to one pound per square inch. There may possibly be here a good chance for inventors; but how is it with the numerous meters used for that purpose by the various scientific bodies? The world has never heard of any special complaints of inaccuracies in the instruments used by them.

## SCIENTIFIC PROGRESS.

## The Three Forces—Physical, Vital and Psychic.

[NG. 15.]

[Written for the PRESS.]

Naturalists are all in agreement with regard to the fact that every articulate animal is composed of homologous segments.\* Prof. Huxley, as quoted by Spencer, says that "a striking uniformity of composition is to be found in the heads of, at any rate, the more highly organized members of these four classes, and that, typically, the head of a crustacean, an arachnid, a myriapod or an insect is composed of Six Somites

(Or segments corresponding with those of the body) and their appendages, the latter being modified so as to serve the purpose of sensory and manducatory organs."

With the exception of the myriapods, he also finds among these groups the further unity, that in most of them the entire animal contains 20 of the homologous segments. Observe that here, for the first time, we have

## Homogeneities

Holding throughout an entire sub-kingdom; in the mollusks the colonial nature was heterogenic, clustering and branching. Among these animals in which no single egg produces several individuals, no individual is separable into several homologous divisions, the converse condition to that obtaining in the annulosa, considered as a group.

The segmented appearance of certain mollusks, the *chiton*, for instance, is only adaptive—has a functional derivation—it is not genetic, being only "shell-deep."

## Retrograding Forms. †

A well-marked example of the retrograding (or degeneration) in articulate animals can be seen in the common mite and in the tick insect. From the same root-stock as the spiders and scorpions (arachnida) have these originated; while the former have degenerated into parasitic forms, the latter have advanced in heterogeneity of organization. One familiar example is the *Demodex folliculorum*; this mite inhabits the follicles on the sides of the human nose, buried in the skin. Parasitism has deprived it of every apparent characteristic of the arachnida; it is a minute worm-like animal, possessing eight degenerated rudiments of legs, and a thoroughly rudimentary structure in other respects. The case of the

## Sea Squirt

Is stranger still. At maturity, it is merely a rooted bag, with a double neck; its larva was free swimming and tadpole-like; it possessed sense organs and a breathing sac—above all, it had the *notochord*, that rod-like body which is the forerunner of the spinal column in the vertebrates, as seen in the *Lancelet*. This little fish, the lowest of the vertebrate, as contrasted with the degenerate sea squirt, is the best example he can bring forward of development, as compared with retrogression.

The young sea squirt, in addition to its backbone and nervous system, possesses a modified throat leading to the breathing sac; its head is provided with suckers which become fastened to some object. This is followed by a loss of the tadpole-like tail; its nerve chord disappears, it assumes a sac-like form, the outer skin becomes tough and leathery, and develops *cellulose*, which biologists will tell you rightly belongs to vegetables alone. The breathing sac becomes more fully developed; the other compartment of the body receives the water used in respiration; this is ejected through the second mouth. The eye of this miserable youngster being no longer necessary, likewise disappears.

\*Copies of the diagrams used by Prof. Huxley at his lectures illustrating this point are given in Vol. II, p. 101 of Herbert Spencer's "Principles of Biology" (Appleton's reprint).

(To be Continued.)

## Porosity.

Porosity differs in degree among solids, and penetrability differs among liquids; as, for instance, coal oil is very penetrating. Sometimes coal oil appears to have gone through the pores of a receptacle, when it has only followed its surface by capillary attraction.

Porosity is shown to exist in the stones taken from the greatest depths of the ocean, as they are penetrated to their very centers by the water.

"Sir John Herschel asks why the atoms of a solid may not be imagined to be as evenly distributed through the space it occupies as the stars that compose the nebulae, and compares a ray of light penetrating glass to a bird threading the mazes of a forest."

One practical illustration of porosity is seen in the filter by which we take out from water intended for domestic purposes the various matters, organic and inorganic, with which it is contaminated. The action of a good filter is not purely mechanical. It is not merely a strainer. Such a material as charcoal has the power of condensing in its pores gases to the extent of very many times its own volume; and within its tiny cells there is an oxidation of putrescent and putrid matters, rendering them harmless even if passed over and taken into

the system. One thing must be remembered in connection with filters; they always require to be cleaned out at specified times; the frequency depending upon the foulness of the water, nature of the filter, and the amount of water which has been passed through.

The filter which requires neither cleaning nor rinsing is of no use as a filter. In some filters, the substances employed are sand or something of that kind which may be stirred up by mechanical means or by a current of water, so that whatever has been taken from one lot of water may be removed by another. In this material is good to use over and over again. In others, charcoal or a similar substance is used, and condenses and holds within its pores the foul matter; in which case the filtering material must be discarded.

## Progress of Electric Lighting.

A good idea of the progress that has been made in electric lighting in this country within a few years past may be formed by the following facts: "Of 150,000 carbons burned daily in the electric lights used in the United States, 100,000 are manufactured in Cleveland, Ohio. Six years ago all the carbons burned in this country were made in a single room in Boston. Now there are 20 carbon furnaces in Cleveland, alone. The carbons are made chiefly of the residuum of oil after it has been refined, but the deposit about natural gas wells is also coming into use. The material is ground to a powder, a little pitch is added, and the substance is then placed in molds. These are packed in boxes and the latter placed in a furnace, where they are subject to the most intense heat. The capacity of an ordinary furnace is 45,000 carbons."

It is said that the number of electric light plants in the 13 principal towns of Germany has increased during the last two years from 131 to 604; the number of arc lamps has increased from 591 to 3280, and the number of incandescents from 10,403 to 50,469. This number of gas lamps in these 13 towns is 1,221,882, and therefore, lamp for lamp, electricity furnishes about four per cent of the total illumination.

**THE FIRST LIGHTNING ROD.**—If we are to believe an Austrian paper, says *La Lumiere Electrique*, the first lightning rod was not constructed by Franklin, but by a monk of Seuttenberg, in Bohemia, named Prokop Divisch, who installed an apparatus the 15th of June, 1754, in the garden of the curats of Prenditz (Moravia). The apparatus was composed of a pole surmounted by an iron rod supporting 12 curved up branches, and terminating in as many metallic boxes, filled with iron ore and closed by a boxwood cover, traversed by 27 sharp iron points, which plunged at their base in the ore. All the system was united to the earth by a large chain. The enemies of Divisch, jealous of his success at the court of Vienna, excited the passions of the locality against him, and under the pretext that his lightning rod was the cause of the great drought, they made him take down the lightning rod which he had utilized for six years. What is most curious is the form of this first lightning rod, which was of multiple points like the one which M. Meisen afterward invented.

**HEAT FROM LIQUID FUEL.**—Naphtha, which is burned in locomotives in the Caucasus, yields 90 per cent of its theoric heating power, while not more than 60 per cent can be realized from solid fuel. Petroleum is now the sole combustible of ships in the Caspian sea, and only half as much is required as was formerly used of coal. The maximum force obtainable from coal is said to be only two-fifths of that which petroleum may furnish; and naphtha will take the place of 8½ times the weight of wood.

**SCIENCE VS. SUPERSTITION.**—The French Academy of Sciences has received a novel work by Messrs. Charcot and Richet, giving for scientific study a collection of representations of persons who have been "possessed of the devil." Various old masters of art are found to have faithfully depicted these subjects in ivory, enamels, tapestries, engravings, paintings and the like, their figures accurately reproducing the traits of the now well-understood states of epilepsy and other nervous affections.

**A SCIENTIFIC PRODIGY.**—It is said that a lad 14 years of age, now living on Boston Bay, who has long been celebrated for his knowledge of ornithology, natural history and chemistry, has now turned his attention to microscopy and bacteriology. Several scientists who have visited him lately pronounce his knowledge and research to be simply marvelous.

**DEATH IN BURNING BUILDINGS.**—The London *Lancet* doubts that persons who perish in burning buildings suffer as much as has been popularly supposed. The victim is generally made faint and pulseless by the carbonic acid or carbonic-acid gas, and becomes insensible before the fire reaches him.

**THE SITE OF ANCIENT BABYLON.**—The sum of \$8000 has been raised to enable Dr. Peters to continue the work of a thorough exploration of the site of ancient Babylon. Important revelations are confidently expected for this work.

**THE EARTH'S CURVATURE.**—The curvature of the earth is such that a straight line one mile long would be 2.04 inches from the surface at either end.

## Coast and Geodetic Survey.

The office at Washington of the Coast and Geodetic Survey has well advanced the engraving of a general chart of the Pacific Coast from Mexico to British Columbia, in two sheets. This will replace the former chart in three sheets. In the preparation of this chart it was very important to have the ocean shore line very accurately delineated, even before the triangulation and detailed topography are finished. For this purpose Messrs. Pratt and Morse made the topographical reconnaissance of the coast from Gray's Harbor to Cape Flattery, fixing the dangerous rocks which border the coast from Cape Greenville to the Strait of Fuca. This was successfully accomplished under many and great difficulties. South of the Columbia river Mr. Rockwell made a topographical reconnaissance between Tillamook bay and the Yaquina Headlight house. This season at the north was very adverse, and the country was very rough and rugged. From the mouth of the Yaquina bay to the Umpqua, Mr. Dickens finished a similar survey, then commenced at Ten-Mile river, north of Coos bay, and made the topographical reconnaissance to Blacklock point, just north of Cape Orford. These were very important additions. Smoke, fog, and rain retarded the work somewhat, and some of the headlands have not trails.

On the Southern Coast Messrs. Rogers and Winston have finished the tertiary triangulation of the coast from Oceanside to the old work at San Diego, and also the accurate delineation of the shore line from near Point San Mateo to False bay. On account of the great development of improvements in the region of San Diego bay, Mr. Rogers made a complete resurvey of the shore line to detect changes therein, and also plotted the new and extensive wharves which have been built in San Diego bay, and the positions of the buoys from the bar to the head of the bay. A complete hydrographic survey of the bay is being made by the city of San Diego, and when this is finished and the currents accurately measured there will be good material to discuss the physical and hydraulic questions to which the building of wharves has given rise.

On that wild and precipitous part of the coast north of Piedras Blancas Light-house Mr. Forney has been engaged in the necessary triangulation and topography to fill in a very important gap hence to Point Sur. This stretch of 50 miles of coast is the boldest by far of any shore from Panama to the Arctic ocean, while broad off the depth of the ocean reaches more than 2000 fathoms within less than 40 miles from the shore.

All the material accumulated by these topographical parties will be utilized in the coming charts. A special hydrographic examination has been made of the San Juan Capistrano anchorage; of the head of the deep submarine valley off Newport bay; of the 17 foot rock in La Bolla.

One topographical party yet remains in the field. Messrs. Sangteller and Wilkes are engaged in the resurvey of San Juan bay, and are now surveying Montezuma slough and the channels to Denverton and Suisun.

The party under Mr. Gilbert has been at work during the season in Washington sound, and has finished the shores of Bellingham bay and the adjacent waters. Mr. Pratt has been for part of the season continuing his former survey from Possession sound.

The main triangulation to connect and strengthen the scheme across the continent with that upon the Pacific Coast under the direction of Professor Davidson, has been successfully carried forward by Messrs. Lawson and Morse, who have occupied Mocho mountain, in Alameda county, 3860 feet high, and observed upon stations in the Sierra over 120 miles distant and as much as 13,000 feet elevation. They have also observed for latitude and for azimuth.

All the parties are now at work in the snob-offices reducing the field observations obtained during the past season.

**LOS ANGELES MINES.**—An Acton correspondent of the Los Angeles Times says: There are about 20 of the best gold mines of Southern California located at this point, which is 30 miles due north of Los Angeles, on the Southern Pacific railroad. Among the principal mines can be counted the Red Rover, Topoka, New York, Little Blue Eye, St. Paul, King of the West and Union. There are many others. The gypsum mine is located about ten miles west, and two stamp-mills are running day and night. Three more stamp-mills are to be erected here. More interest is taken in the mines here in the last few months, and lively times are expected in February and after.

The lumber product of the Emigrant Gap mills this season amounts to 5,000,000 feet. Of this amount Towle Brothers have cut 2,500,000 feet; Carlin, 1,500,000 feet; and Geisendorfer, 1,000,000 feet.

The Truckee Lumber Company purchased nearly a million feet of lumber from Geo. Schaffer, which will be sufficient to keep the box factory running all winter.

There are more snowbirds in Virginia City this winter than ever before.

## USEFUL INFORMATION.

## Our Foreign Trade in Wood and its Manufactures.

We give below the extent of our foreign trade in wood and the manufactures there-of for the nine months ending March 31, 1887, and for the corresponding months of the year preceding. It will be noticed that there was a small increase in the imports of this line of merchandise, while there was a decrease in exports of considerably over \$1,000,000. Our imports of all kinds of wood and timber manufactured in 1886 were valued at \$5,601,048; the same for 1887 were \$5,354,954. Wood and timber manufactured, including cabinet ware, furniture, etc., for 1886 was valued at \$1,277,061; the same for 1887 was \$984,306. Unmanufactured and free of duty for 1886, \$2,429,118; for 1887 it was \$2,476,005. Making a grand total of imports for 1886 of \$9,321,834; for 1887, \$8,830,010. Our exports of lumber of all kinds during 1886 were valued at \$10,401,032; for 1887 they were \$11,258,511. Our exports of wood manufactures—doors, blinds, house-trimmings, furniture, barrels, etc., amounted to \$3,356,260 in 1886 and \$3,425,284 in 1887, making a grand total of wood and wood manufactures of \$13,761,363 for year ending March 31, 1886, and \$15,191,833 for year ending March 31, 1887. It will be noticed that while there was an increase in the value of imports in this class of merchandise of \$482,824, there was a decrease of \$1,424,820 in the value of exports. Of the imports of wood unmanufactured, \$2,429,118 worth came in free of duty. This came almost wholly from Mexico, Central American States, the West Indies and the countries of South America, and consisted probably of those ornamental and other woods which are not produced in this country. Of the dutiable merchandise of this class, the bulk of it was from Canada, and comes in direct competition with the products of this country. The total value of our foreign trade in this class of merchandise, including imports and exports, for the nine months ended March 31, 1887, was \$23,053,197, against \$24,030,893 for the corresponding months of the year preceding, showing a decrease of nearly \$1,000,000.

**IMPROVEMENT IN LEATHER MANIPULATION.**—A new system of connecting several thicknesses of leather either in making double or triple thickness leather belting, or in affixing the soles of boots to the upper, described in *Engineering*, is being introduced into England, where machines are being exhibited as need for attaching the soles of boots. The new system partakes more of the character of riveting than any other known method, the new rivets being made of metal-covered wax thread. Each fastener is thus a tubular rivet filled with firmly inclosed wax thread. One of the chief objects of this tubular rivet or piece of metal-covered thread is a firm fastening, with greater flexibility than has hitherto been obtained with machine-work. It would be impossible to explain the construction of the machines used without drawings, but we may say that the covering process is performed on a machine in which a strip of brass is pulled through dies which inclose the wax thread fed to it. The tubular thread from this machine passes to another in which the tube is rounded and corrugated circumferentially by small rotating disks with fine teeth. The corrugation helps to give the fastener a firm hold, and also to make it more easily flexible than it would be if the metal tube were plain. The edges of the strip are not soldered or brazed so as to make it into an actual tube. The next machine shown in operation is one in which boot soles are affixed in a few seconds; the machine pierces the leather cut off a length of the metal-covered thread, automatically adjusting it according to the thickness of the leather being fastened. The covered wax thread is then driven vertically into the sole of the boot. It thus presents an end-wearing surface; the brass covering, as the leather wears, burrs over, forming a head on the outside of the sole, and prevents its working into the foot, an objection which attaches to other metallic fastenings.

**THE NUTMEG.**—The nutmeg is grown on islands in the Malay archipelago. The volcanic group of Banda, consisting of three small islands, produce the nutmeg in perfection. This light volcanic soil, the shade and the excessive moisture, where it rains more or less every month in the year, seems to exactly suit the nutmeg tree, which requires no manure and very little attention. All the year round flowers and ripe fruit are to be seen on the trees. Few cultivated plants are more beautiful than nutmeg trees. They are handsome shaped, glossy-leaved, growing to the height of 20 to 30 feet, bearing small yellowish flowers. The fruit is the size and color of a peach, but rather oval. It is of a tough, fleshy consistence, but when ripe splits open and shows the dark-brown nut within, covered with crimson mace, and is then a most beautiful object. This mace covering is valuable and finds a place in the apothecary of every good cook. Within the hard shell of the nut is the seed, which is the nucleus of commerce with which we are all familiar.

**EDIBLE BIRDS' NESTS.**—Naturalists have not been able to decide of what material the edible birds' nests are composed. Some have regarded

them as made of pure animal secretions; others believe that they are largely into their composition. Mr. E. L. Layard has suggested that the nests of the first quality, or those that are made early in the season, are made of secretion, but that later on, if the first nests be destroyed, the birds cannot replace them by this secretion alone, and have to use extraneous substances to help in the construction. Mr. J. R. Green of the Physiological Laboratory, Cambridge, has examined specimens of the nests of various qualities, and has found them all to become alikes gelatinous in texture on soaking, and made up of laminæ affixed by their faces to one another. Some nests of inferior quality showed the presence of algae, but neither in their mode of disposition nor in the quantity did they confirm Mr. Layard's view. The scanty amount and irregular position of the algae would be better accounted for on the theory of their being accidental constituents.

**THE CHAMPION LOG CUTTER.**—The *Oroville Register* says that H. C. Groth, who has been cutting logs in this county for the past 17 years, during which time he has sawed some 34,000,000 feet of logs, performed a feat a few days ago which is unparalleled in the records of log cutting. Inside of 15 minutes he sawed 1581 feet; in 1 hour and 15 minutes, he sawed 6643 feet; in the forenoon of 5 hours and 20 minutes, he sawed 22,000 feet. This day's work of 10 hours and 20 minutes footed up to 39,959 feet, composed of 33 sugar-pine logs 16 feet in length. For proof of correctness of the above figures he mentions for reference A. J. Glidden, J. J. Kitrick and Chas. Dickenson, all of Lumpkin postoffices. This above work was done with the Simonds saw, which Mr. Groth, who has tried all brands, both Eastern and coast make, in his 17 years' experience, upholds above all others and admits of his inability to do the same work with any other saw. He challenges the world to saw against him, and is prepared to back his statement of his ability to saw 40,000 feet of sugar-pine logs in 10 hours' work.

**SOLDERING FLUIDS.**—Some, in fact quite a number, of the soldering fluids used are injurious to tools, and also to parts that have been laid on the bench where such fluids have been used. The following recipe will do the work as well and will not rust or tarnish any more than water would: Take two ounces of alcohol and put into a bottle, and add about a teaspoonful of chlorids of zinc and shake until dissolved. Use it in the same manner as the muriats of zinc or muriatic acid and zinc. It has no bad smell.

## GOOD HEALTH.

## Coffee—Its History and Use.

We give from the *Chronicle* the following report of a lecture recently given by Prof. Lane before the Cooper Medical Institute of this city on the origin, history, and use of the coffee plant:

"In searching for the origin of coffee," said Prof. Lane, "authors have agreed to assign its birthplace to Ethiopia. When it was carried to Arabia it soon became naturalized. In a search for the earliest mention of it, one writer, inspired with that reverence which has sought to find out all things in the sacred book, assures us that coffee is mentioned in the history of King David, where it is stated that this was the potion which was offered by the hands of fair Abigail to calm the excited monarch. The proof urged in favor of this biblical claim is that the drink offered was prepared from something roasted."

"While visiting Paris," continued the lecturer, "I was agreeably surprised to find in a museum a portion of the original coffee shrub which was brought to France. Probably no more precious sample of this berry exists in the world. Coffee, at the time of its introduction into use, was very expensive, selling for from \$20 to \$25 a pound. Such a price led to its general cultivation, and soon, instead of being the monopoly of Arabia, whence it was first derived, it was grown in the East and West Indies, Central and South America, and now large amounts of it are grown in Java, Ceylon, Mexico, Guatemala, Costa Rica and Brazil. The production of the latter country is the largest, being about 4,500,000 quintals annually, one sack generally holding about one quintal. While coffee can only be cultivated in a warm climate, yet it cannot bear great heat. The seed is first planted in a cool, shaded nursery, the infant plants being scrupulously screened from the rays of the sun. It is next transplanted to the fields destined for its growth, and there it is carefully cultivated for nearly five years before the product is sufficiently abundant to be remunerative. The shrub usually reaches a height of from 12 to 15 feet, and is well covered by leaves of a dark, glossy green. Small flowers of snow-white color spring from the stem at the foot of the leaf. When in full bloom the appearance is exceedingly charming. The flowers are soon transformed into round, green berries, which, ripening, present the appearance of red cherries. From two to three crops of mature berries may be gathered annually. The work of preparing the berries for the market is done partly by hand and partly by machinery. Each berry should have two grains on it, yet sometimes but one is found, and this one is especially

prized and commands the highest price. The pulp of the berry is sweet to the taste.

"A chemical analysis of coffee, after being burned, shows that it contains 20 per cent of water and about 50 per cent of cellulose—a substance resembling starch—and grape sugar. The agents which especially distinguish it are caffeine and coffeine. The former belongs to that group of chemical agents named alkaloids. Coffeine is a volatile oil, the result of an essential change in coffee produced by roasting. To this subtle and fugitive principle the aroma of coffee is due, and in roasting this oil permeates the entire grain; but if the heat be too great, or continued too long, it is dissipated and lost. Experiments show that caffeine and coffeine have different effects on the animal body, the caffeine acting as a transient stimulant, while the coffeine is more prolonged in its effects and exercises a sedative or tranquillizing action. But in drinking an ordinary cup of coffee, these two actions are obtained, stimulation preceding for 15 minutes the stage of sedation or repose.

"Coffeine lessens tissue waste. Physicians have found that, among other articles, coffee temporarily arrests and stays this change. Coffee has another action—that of stimulating the faculties. The soldiers of the French army fought better in Syria and Egypt because they received coffee among their rations, and to authors and scientists it has been an untold blessing. Certain evils, too, may arise from its overuse, such as insomnia and palpitation of the heart. Children should not be allowed to drink it freely, because, as Savarin says, it dries them up and converts them into dwarfed machines. Commercial cupidity and dishonesty of the dealers often prevent the article from coming pure on our tables. But there is cheating in all trades. Both ground and unground coffee are falsified.

"Coffee figures largely as a remedial agent and a disinfectant. For nervous headache, it is often a cure, and gives great help in cases of narcotic poisoning or great depression of strength from hemorrhage. As a disinfectant, it is less disagreeable than chlorids of lime and more accessible."

At the conclusion of the lecture, loud applause ensued. Prof. Lane then announced that on the evening of January 20th Dr. Cushing would lecture in the same place on "Physical Exodous."

## The Importance of Vaccination.

Dr. H. S. Orms, president of the State Board of Health, in an article on vaccination says: During the prevalence of an epidemic of smallpox almost every one under the influence of fear or by force of the municipal law is sooner or later subjected to vaccination, and upon many of those previously vaccinated, the operation is repeated. Only the unprotected are attacked, and the epidemic dies out at length for want of fuel. A period of rest ensues, during which a certain proportion of adults who have been vaccinated in youth acquire renewed susceptibility, and others have been gradually but continuously added to the population by birth or immigration who have never had the disease nor been vaccinated. The fertility of the soil is thus renewed, ready for the reception and propagation of the germs whenever accidentally introduced.

We, in California, have passed through one of these periods of rest. Numbers have been added to this population of both city and country, and inasmuch as where there is cause for alarm the duty of vaccination is likely to be postponed, many of these are now unprotected; new material available for the disease has sprung up.

While, therefore, the necessity of vaccination with those who have never been subjected to this safe and simple expedient is, in times of threatened danger, specially urgent, this necessity does not apply solely to them. It is a conceded fact in the history of vaccination that, in very many cases, the immunity it affords is only limited, or for a time. Perfect while it lasts—as perfect, it is believed, as a previous attack of smallpox itself—the duration of the insusceptibility varies with different individuals. Though in some instances it is unquestionably permanent through life, it is safe to say that revaccination should always be tried after the expiration of eight or ten years, or, otherwise, whenever during the prevalence of smallpox it is desirable to be assured of protection. By the observance of this rule, and the general adoption of primary vaccination in youth, it is equally safe to say that one of the most loathsome diseases which afflict mankind may be effectually robbed of its terrors.

**KEROSENE AND DIPHTHERIA.**—A well-known doctor says that the fumes of kerosene when a lamp is turned low are likely to cause diphtheria. The New York Board of Health a few years ago decided that to this, more than any other cause, the prevalence of this disease was to be attributed. This is given as accounting for the fact that diphtheria generally begins to spread with the advent of short days and long nights. Children dislike to go to bed in the dark, and the kind mother lets the lamp remain in the bedroom, usually turning down the flame, so that the light will not keep the child awake. Many bedrooms are thus semi-lighted all night, and the windows being closed or raised but slightly, the atmospheric condition is simply deadly. A turned-down kerosene lamp is a magazine of deadly gas that the healthiest lungs cannot be safely exposed to,

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**ZEILE.**—Amador *Ledger*, Jan. 14: At this time a number of hands were laid off temporarily, in order to clean out the bottom of the shaft and probably sink two or three sets deeper. The cleaning-out process was finished early in the week; the sinking may take several weeks to complete. Twelve or 14 men are employed in sinking, working in three shifts of eight hours each. It is impracticable to hoist rock and sink the shaft at the same time, consequently all miners who have been employed below the 240 level are enjoying a holiday. It is intended to do some repairing at the mill and also shift the engine at the hoisting works to a new foundation.

**CLEVELAND.**—This mine, above Big Bar bridge, on the Amador side of the Mokelumne river, is being rapidly put into condition for active mining operations. There is a pile of ore estimated at over 200 tons on the dump, all of which is confidently expected to reach a high-grade average. By some it has been estimated to yield from \$20 to \$5000 per ton; but wild reports of this nature carry no weight whatever. They are calculated to injure rather than assist the mineral development of this section. Persons acquainted with the gold-bearing quartz of Amador county place no dependence upon such extravagant figures. If the ore reaches anyway near the lowest figures it will do remarkably well. Those who have seen the pile say the rock has all the indications of proving of a paying character. It is heavily charged with galena sulphurets. They are putting up water-power machinery, and have laid over 300 feet of pipe, with a pressure of 300 feet. We expect to hear of good results from this mine. It is owned by Col. Robinson, but has been bonded by a Mr. Taylor, who is urging forward the development work.

**VALPARAISO.**—At this mine M. Garabaldi and his two partners got through with their contract in running the tunnel last week. They have been three years on this work, and have bored through the ground for 1300 feet in that length of time, carrying the breast of the tunnel to within 200 feet of the south boundary line dividing the claim from the Mammoth. In payment for this big undertaking they receive a quarter interest in the mine, or a one-twelfth interest each. In running this tunnel they have come across several deposits of the rich black metal peculiar to that district. It is believed a regular ledge exists about 30 feet through the slate on the hanging-wall side, and it is intended to crosscut to ascertain whether this idea is correct. The erection of a mill is talked of, but what kind of a mill is best adapted for the ores of this district is a question not easily answered.

**AMADOR GOLD MINE.**—There is an activity about this mine which presages well for the faith of its promoters in its value and permanence as a future gold-producer. A large three-compartment shaft has been started southeast of the present works. In the other two shafts the developments are of a highly satisfactory nature. In one a large ore body 30 feet wide has been encountered. In the other a six-foot vein has been cut. Practical miners say the rock looks well, and ought to reach, judging from its appearance, considerably above the paying standard. Over 30 men are employed about the mine, and the number of hands has been increasing steadily for some time. All indications continue to point to the developing of a big mine. The erection of a mill and the decisive settlement of the question whether the ore will yield satisfactory results by actual mill process is a matter of vital importance to Jackson and the mines in the immediate vicinity of the Amador. The actual extraction of gold in paying quantities from the vast fissure vein exposed in this mine, will do more for Jackson than any event that has happened since the resumption of work at the Zeile.

**SUTTER CREEK.**—Cor. Amador *Ledger*, Jan. 13: Everything in this section has been tied up by frost. The mines and mills are all idle, pipes and faucets in many cases being bursted. The Hector Co., better known as the Mahoney, is likely to be the scene of another legal conflict. Mr. Stewart, who has leased a portion of the Lincoln mine to four miners, has been denied the right of way to the mill by the Valentines, the ground below the Lincoln mine and mill belonging to them. Mr. Stewart claims, that having had the right of way for the last 15 years, he cannot now be deprived of it, so long as he does not damage the property of others.

## Calaveras.

**MURPHYS.**—Cor. Angels *Record*, Jan. 11: Mining is still the all-absorbing topic in conversational circles, and we look forward to the not distant day when we will be enrolled in the bullion-producing districts not far from the front. The recent cold weather has retarded work considerably, but fairer weather will start the mills again. Six hundred pounds of powder was exploded on the 2d inst., in the bank of the Central Hill gravel mine owned by McCormick, Bisbee and Thomas. L. Hausler superintended the firing of the blast and it was an entire success. A dull sound was heard, an undulating movement of the surface observed, and two acres of gravel, nearly 30 feet deep, was broken ready to yield to the action of the hydraulic as soon as the thaw commences. Then the gravel will be piped off level with the present flume, and the bottom will be hoisted with a derrick. Although the entire bank contains gold in paying quantities, it is on the bottom that the better pay is found. All mining enterprises are on a standstill; mills and mines inert on account of the cold snap. The Ora Plata labored hard to keep the pump in motion, but had to succumb to the extreme cold weather that has done up everything. The same may be said of the Esmeralda and all other mines where water is the motive-power. There is a scarcity of water for gravel diggings also and will be, until a thaw sets in. The supply in the Union Water Co.'s ditch, of course, is greatly lessened by the water freezing in the river and forming anchor ice in the flume.

**STORE OF SNOW.**—Angels *Echo*, Jan. 14: The mine-owners of this section have just cause to feel jubilant over the immense store of snow now laid up

in the mountains, which, it is reported, is sufficient to supply the water demand for mining and milling purposes throughout the entire year.

**MOHAWK.**—Things are being put in readiness at the Mohawk gold mine, formerly known as the Comet mine, situated about 1½ miles from San Andreas, on the Mokelumne hill road. As soon as everything is in readiness, work will be commenced on an extensive scale.

**ORE.**—It is currently reported that Mr. Chas. J. Nickerson will proceed at once to place men at work extracting ore from the Tiberghien mine, situated a short distance west of this town. The ore, we are informed, will be crushed in the Gold Cliff mill, and if the test proves satisfactory, Mr. Nickerson will purchase the property and make preparations to develop the mine on an extensive scale.

**INTERRUPTED.**—Mining operations are greatly interrupted here by the present cold snap. Nearly every water conduit in this section is frozen up, and in consequence the mills heretofore have been compelled to close down until the ice and snow thaw. Quite a number of the miners are laid off at the Nevills and Utica mines until water can be had.

## Inyo.

**KEYNOT.**—Inyo *Independent*, Jan. 14: Mike Lasky has eight men at work in the Keynot mine; they are getting out ore and the mine is said to be looking very well. Mr. William Charles is vigorously pushing work on mines recently bonded by him north of Bishop Station. The prospects are very encouraging.

## Los Angeles.

**SAN GABRIEL SILVER.**—Los Angeles *Times*, Jan. 14: Over 25 years ago, as many remember, rich silver mines were located and worked in the vicinity of San Gabriel canyon, in the mountains of the same name. From the many shafts and tunnels now to be found in different sections of that locality, it can be seen that prospecting was extensively carried on during those days. It has always been considered that a rich lode was to be found somewhere in the vicinity of the old Zapata mine, as everything indicated that large bodies of ore had at one time been extracted from the heart of the mountain at that point. Until last September miners have received little or no encouragement for their researches. During that month Mr. Henry Defty, a practical mining engineer, discovered croppings which led him to believe that a rich body of silver ore lay at no great depth, and be at once formed a syndicate of English capitalists for the purpose of developing the lode. The location of the ledge is on the north side of the San Gabriel river, about 2½ miles up the canyon from the town of Azusa. The location is farther up the canyon than were the old Zapata claims, and surrounds the whole of the mountain in which the latter was formerly worked. There are 15 claims in all. A drift was first run into the base, or bottom rock, so as to retain uniformity and avoid expense in timber, and to preserve the shafts, etc., in the future. This drift is driven in about 250 yards, and has cut one seven foot, and another 30 foot lode, each of which is overlaid by a large vein of silver-bearing ore. An assay of the rock at this point shows from 20 to 200 ounces of silver, with from five to seven ounces in gold. It being reported that a rich find had been made of late at the Victoria mine, a *Times* representative was recently detailed to make a report of the condition of the workings of the English mine. Between 300 and 400 tons of ore were found on the dump at the time of the reporter's visit. An air shaft was found sunk so as to cut the top lodes, and is so constructed as to meet a tunnel run from the level of the river and which meets the lower ledges. The air shaft is timbered on top only, and is at present but 40 feet in depth. The lode in which the late rich strike was made is known as the Daisy, and the last assay shows from \$65 to \$191 to the ton of rich-bearing sulphate of silver. Seven assays have already been made, and all are of the most encouraging character. From 20 to 40 men are employed. Ground is being leveled for the erection of a quartz-mill, plans and specifications being already completed by Mr. William Defty, a civil engineer of London. There will be several sets of stamps, comprising 20 stamps to a set, and it is anticipated that the first set will be in position within two months' time. Two tunnels are now in working order. It is not accurately known what the width of the main ledge is, nor can this fact be ascertained until the crosscut is made.

## Nevada.

**SUSPENDED WORK.**—North San Juan *Times*, Jan. 13: The Grant mine, in consequence of the cold snap, which froze up the water supply, was compelled to suspend milling operations for a few days; therefore no general cleanup and no dividend. The Delhi has suspended crushing for an indefinite period, because of the closing of the ditch, by snow, from which the mine obtains its water-power. In the meantime quarrying rock still goes on.

**ENCOURAGING DEVELOPMENTS.**—*Transcript*, Jan. 13: Alf. Tregidgo, manager of the Washington and Bluebell mines in Washington township, came down yesterday and to-day goes to San Francisco for a week's stay. The mills at both of the mines, which had been temporarily shut down on account of the cold weather, were started again yesterday and are now crushing steadily. At the Washington the work of exploitation has resulted in opening one of the largest and best ore deposits ever seen in that part of the county. The mammoth ledge at the Bluebell also continues to hold its own. The capacity of both mines will be increased next summer by the addition of more stamps.

**NOTES.**—*Transcript*, Jan. 17: Chas. Pinch, Ed Smith and Tom Coughlan have been awarded the contract of the Wyoming mine. John Bonney has taken out 20 tons of quartz from his mining claim in his dwelling lot on Piety hill. Jerome Cook, W. J. Organ and others have been prospecting a gravel claim near Gussett's ranch. They have struck gravel that yields quite well.

## Placer.

**GRAY EAGLE.**—*Argus*, Jan. 14: The Gray Eagle Mining Co., near Spring Garden, received a new engine and boiler from Joshua Hendy. The mine is running full-handed and is doing well.

## Plumas.

**MINERAL TOWNSHIP.**—Cor. Plumas *National*, Jan. 14: Right glad are we to chronicle that the revival of gold quartz-mining in the county and

State generally is on a boom. New mines have been discovered, and old ones are being opened up and worked with advantage to the owners, and such being the case, the miner's outlook in these mountains gives us all to feel there is a better day dawning in the future for the much-abused miner. There is a true mineral belt of a rich gold-bearing quartz running through this county, and a few mines only have been opened on it, but prospecting on said belt has been quite brisk the last year, and as quartz-mining in California on the whole is yet in its infancy, we must wait developments. We have millions of tons of quartz in this county that will pay big interest on investments if worked with economy on the improved basis of milling.

## Shaeta.

**BULLION.**—Shasta *Democrat*, Jan. 11: Fifteen bars of bullion from Iron mountain were shipped from Redding last Friday to the Argo smelting works, Colorado. The bullion weighed 2000 pounds.

**SHUT DOWN.**—The Squaw creek mines and mills have been shut down during the late cold snap, as the water used in milling kept freezing, thus interfering with operations until the operators had to quit.

**BULLYCHOOP.**—F. D. Robinson of Ono says Bullychoop mining district is developing wonderfully, and believes it to be one of the best mining districts in the State. An English syndicate recently offered Senator Foster \$350,000 for his group of mines in which Mr. Robinson was formerly interested, but Mr. Foster declined the offer, holding the property at half a million dollars.

## Sierra.

**THE ALASKA.**—North San Juan *Times*, Jan. 13: Colonel Bates, who has been absent for several weeks in the interest of the Alaska mining company, arrived here Monday, en route to Pike City. The probabilities of a speedy consummation of the sale of the Alaska are very flattering. This contemplated sale has been pending for a long time and would have been consummated ere this but for unforeseen circumstances which could not be avoided, the resignation of the Assistant Secretary of the Interior being one of them. We learn from the colonel that, independent of the sale of the mine, he has made arrangements with Eastern capitalists for the means of liquidating any debts the company owe and to place it on a paying basis, so that hereafter full payment of employees shall be made every month in full; also for the erection of additional stamps, so as to increase the number to 60, and to sink 250 feet below the 500-foot level; also for the placing in position of duplicate pumps of larger capacity than those now in use.

## Siekiyou.

**SCOTT BAR.**—Yreka *Union*, Jan. 14: Mr. Shepherd had to close down his mill on account of the cold snap, and all the other mills can do little or nothing. The Scott River Ditch and Mining Co. are at present setting up their new Monitor on Whiting bill.

## Trinity.

**ANOTHER GOOD CLEANUP.**—Trinity *Journal*, Jan. 14: Mr. A. T. Jackson, superintendent of the Enterprise mine, East Fork district, came in town last Sunday with \$1600, as the result of crushing 13 tons of ore from that mine—an average of about \$125 to the ton; the dump is full of the same kind of rock, but means of crushing it are deficient. The cold weather and snow have stopped the arastra, but work on the mine is continuing just the same as ever. Three tunnels are now being run; in the upper tunnel the ledge is two feet wide and of very high grade. The company are also running a tunnel on the Lone Jack; they are in about 80 feet and think they are in the vicinity of the ledge. Mr. Jackson says that four years' work with an arastra is in sight now in the Enterprise. The chance of finding an equally good ledge in the Lone Jack is promising. The company have a fine property and are talking of putting up a mill on it in the spring.

## Tulare.

**MILL CREEK MINING DISTRICT.**—Kingsburg  *Herald*, Jan. 14: Situated some 24 miles east from Kingsburg, well up in the foothills of the Sierra Nevada, there are gold mines being worked which at this present time give every indication that ere long their output in gold will place the properties in a very profitable position. The principal mines of the district are the "99" and the White Cross. The tunnel of the former is in some 90 feet, with the face showing up finely. The ledge at this point is some 19 inches wide and the rock is free milling ore. The mill returns an average of \$22 per ton, which gives a good margin for profit. The owners of the White Cross have started to run a tunnel, and expect to tap the ledge when in 100 feet. The industry of that section is not alone confined to gold mining. There is a large quarry of limestone, which is to be extensively worked in the spring. The Diamond Limestone Company have started the building of three kilns for the burning of the stone. They have about 20 men at work. Mr. Donahoo of Fresno has contracted, it is said, for all the lime the company burns this season when in operation. Mr. P. W. Rider, who kindly furnished us the above items, adds that all indications point to Dunlap, which is the postoffice address of the camp, becoming a very active place in the spring.

## Yuba.

**QUARTZ LOCATION.**—North San Juan *Times*, Jan. 13: John Downey has located a quartz claim at the junction of the Middle and North Yuba rivers, on the Yuba county side, which is 30 feet in width 30 feet below the surface. Almost every piece taken from the ledge shows free gold. It is the continuation of the lode located by George N. Powell, Frank N. Morris and Fred Philbrick on the Nevada side of said rivers.

## NEVADA.

## Wahoe District.

**CON. CAL. AND VIRGINIA.**—Virginia *Enterprise*, Jan. 14: Are still stoping out ore south and west from the bottom of the winze down from west crosscut No. 2. This ore is still of a high grade. On the 1300, 1500, 1600 and 1650 levels the various drifts, winzes and upraises are being pushed ahead in promising material. The usual amount of ore has been shipped during the week, the average assays of battery samples being about the same as last week.

**SAVAGE.**—On the 400 level the north drift has been advanced 50 feet. Are saving some ore from

this drift. The south drift has been advanced 62 feet, and has its face in low-grade quartz. On the 600 level the main south drift has been advanced and timbered 20 feet. The face shows stringers of ore. Ore is being extracted from the several levels between the 400 and 900 levels. The severe weather has frozen the water in the Carson river and temporarily interfered with ore shipments.

**GOULD AND CURRY.**—On the 250 level east crosscut No. 2 has been extended 23 feet; total, 61 feet. The face is in bird's-eye porphyry. Are running prospect drifts in the old stopes in different directions and are finding some ore of milling value. On the 1300 level the south drift from the east crosscut has been extended 50 feet; total, 103 feet. The formation in the face is hard porphyry. Are making some necessary repairs to the main shaft below the 1000 level.

**HALE AND NORCROSS.**—On the 400 level, 50 feet back from the face of the west drift, have started a drift north and south. The north drift has been advanced 20 feet and the south drift 30 feet. On the 700 level the ore development shows further improvement. From the top of the north upraise have begun to crosscut east and west. The east crosscut is out 8 feet, and continues in good ore. The west crosscut has been advanced 12 feet, and is in excellent ore.

**OCCIDENTAL.**—No. 1 upraise, south of the north incline winze, upper tunnel, has been carried up 16 feet; total raise, 39 feet. No. 2 upraise, 72 feet north of the north incline raise, has been carried up 20 feet; total raise, 49 feet. Are overhauling the track in this tunnel. The ore extracted on the 48, 100 and 200 levels has been held in the mine. From the points named 50 tons of good milling ore has been broken down and is in the chutes.

**BELCHER.**—Streaks of low-grade quartz are still showing in the face of west crosscut No. 2, on the 400 level. Good headway is making in the south drift on this level. On the 500 level good progress is making in the south drift from the south drift in the Crown Point. From this drift an upraise will be made in the Belcher ground. Are still pushing forward the Suto tunnel drift.

**BALTIMORE.**—The pumps are fast reducing the water in the main shaft, as the inflow from the face of the crosscut on the 300 level is gradually decreasing. There are deposits of good ore at two or three points between the 300 and the 500 levels that can be worked as soon as the water has been reduced.

**CHOLLAR.**—Good headway is making in the re-opening of the main incline from the bottom of the vertical shaft down to the Suto tunnel level. The usual amount of development work is being done and much good milling ore has been opened up, ready for extraction.

**SIERRA NEVADA.**—The usual progress has been made in the southwest drift from the main north drift. It is passing through a vein material composed of quartz, clay and porphyry. This drift has been turned and is now running almost south.

**EXCHEQUER.**—The west crosscut on the 122 level is making good progress in favorable material, and No. 2 east crosscut on the same level is out 90 feet. Good progress is making in the northeast crosscut on the 222 level; also in sinking the shaft.

**UTAH.**—On the 472 level the east crosscut from the north drift from the end of west crosscut No. 6 has been extended 32 feet; total length, 50 feet. This crosscut is passing through a porphyry, clay and quartz formation.

**ALTA.**—Ore is being extracted at the usual points. Owing to the severe weather and the depth of the snow in the vicinity of the works, little can at present be done at ore crushing.

**BEST AND BELCHER.**—On the 1300 level west crosscut No. 2, opposite east crosscut No. 1, has been extended 12 feet; total length, 57 feet. This crosscut is in vein matter giving low assays.

**YELLOW JACKET.**—The daily shipments average 300 tons of ore. This ore comes from points between the 1100 and 1400 levels. On the 1100 good ore was cut near the Confidence line.

**CROWN POINT.**—The indications are that the west crosscut on the 500 level will soon cut the ore vein found 100 feet above. A considerable flow of water has been encountered.

**HAYWOOD.**—The ore development on the 200 level continues to look well. The extent of the deposit is not known, but the indications are that it is of a large size.

**SCORPION.**—On the 300 level the south drift has been advanced 43 feet and the north drift 54 feet. Work was interrupted for a few days by the recent storms.

**POTOSI.**—The stopes on the 250 and 350 levels are yielding the usual quantity and quality of ore. The assays of battery samples at the new mill average \$20 a ton.

**BENTON.**—Work is progressing favorably on the 725 and 800 levels. The material is vein porphyry, with some clay and stringers of quartz.

**OPHIR.**—The north drift from the workings in the winze 35 feet above the 1435 level is still following a promising streak of ore.

**OEST.**—The ore-producing sections are all looking well and development work is being done in very promising ground.

**SEGREGATED BELCHER.**—On the 1300 level the south drift from the upraise is in quartz giving low assays.

**ANOS.**—On the 350 level streaks and bunches are being encountered in the west drift.

**WEST CON. VA. AND CAL.**—The work of sinking the main shaft is progressing favorably.

**MEXICAN.**—The west crosscut from the north drift is in soft vein porphyry.

## Columbus District.

**LUCKY HILL.**—Esmeralda *News*, Jan. 14: It is rumored that the Lucky Hill series of mines will start up shortly and a force of 30 men will be employed at once, which will be increased as rapidly as possible.

## Dun Glen District.

**THE LANG SYNE MINE.**—Silver *State*, Jan. 13: The Lang Syne mine and mill at Dun Glen has been purchased by J. V. McCurdy, superintendent of the Paradise valley mine, who will run it on his own account. He intends to increase the crushing capac-

ity of the mill from 15 tons to 45 tons per day by adding Huntington crushers and concentrators to the battery now in use. He also intends some time next spring to erect works that will reduce 75 tons of ore daily. He will commence operations next week and is now having teams shod and wagons repaired to haul ore and sagebrush to the mill. Grading will also be commenced for the new mill, the machinery for which will be ordered immediately. T. D. Soper, who has been foreman of the Paradise valley mine, will assume charge of the mine and mill. This will give Dun Glen quite a boom, and as there is plenty of ore in sight in the mine, and as the lead is a true fissure vein and opened by tunnels to a depth of 500 feet, the old camp will doubtless have many years of prosperity.

#### Eureka District.

**EUREKA CON. MINE.**—Eureka Sentinel, Jan. 14: For several weeks past we have heard it reported on the street that a great improvement was taking place in the Eureka Con. mine, and we have had an opportunity to see what ore was being delivered at the furnaces in town. We mentioned in the Sentinel several weeks ago that the ore was increasing in the mine, and further, that there were several train-loads delivered at the smelters. Since Al. Burt was appointed foreman it has leaked out that he has been kept busy poking around through all the old holes in the mine wherever there was room to crawl through. A number of old drifts and openings have been cleaned out, and several places that presented a showing, or a good prospect, have been attended with good results and ore found. It was currently reported on the street last Monday that a big strike had been made on the 200 level of the K K, where it is well known that there is plenty of room for large chambers of ore to make. A miner, who has been known on Ruby Hill and in other mines as a very lucky tributer, has had a pitch on the 200 level of the K K for the past four or five months, where he has made only a bare living. It is now stated that he has followed indications that have led him to a deposit of ore of no small dimensions, and that it looks as if it would open up into a big chamber. Last Wednesday we heard that this ore had been penetrated for a distance of 30 feet. We learn from a reliable source that there is a large quantity of ore broken in the mine that will work from \$25 to \$100 per ton; and further, that a train-load of ore per day, for several weeks to come, can be broken down and sent to the furnaces as soon as they are ready to receive it; also, that the tributer's pitch, above referred to, is yielding ore that will work as high as \$100 per ton. Besides the tributers there are from 20 to 25 men at work in the mine on day's pay, and some of the later are breaking down ore in good paying quantities. The mine is, in fact, looking better in every direction than it has before for the past three years. It is at present self-sustaining, and notwithstanding that considerable dead-work is being done, we confidently expect that in a few months from now it will be on a dividend-paying basis, independent of the slag dump at the furnaces, from which the late dividends have been paid. Foreman Burt, under Superintendent Donnelly, is pushing prospecting ahead wherever there is a chance for ore to make; and we have every reason to hope that the Eureka Con. mine will again loom up as in former years.

#### Hawthorne District.

**THE MINES.**—Esmeralda News, Jan. 14: Last Thursday D. Tubino, one of the lucky owners of the Gold Bar mine, showed a reporter of the News a piece of rock from that mine which weighed about ten ounces, it being one of a number of specimens that he had extracted for samples, and if Mr. Tubino could get but one ton of the same kind of rock we will venture the assertion that his share of the net profits would be \$1000. Several men are now at work on the property and in a few days it is expected that the main body of ore which is known to exist in the mine will be reached. Some very rich rock is also being produced by the Half Moon Bay mine, in the same district. As this property has had but comparatively little work done on it so far, it is to be hoped, for the benefit of the district, that the favorable prospects will continue. Messrs. Wood & Olsen, the lessees of the famous Lapanta, have a large force of men at work. The lease runs several months, and the indications are very favorable. In the Pamlico much deadwork is being done at the present time, the same being necessary in order to open up the property so that when the extraction of ore is again resumed it will not have to be handled more than once. S. V. Hauger has located the G. C. Scott, which is said to have very valuable prospects.

#### Marietta District.

**GOOD PROPERTIES.**—Esmeralda News, Jan. 14: There are about 25 men at work in Marietta district, this county, and from the following items, obtained from a gentleman recently from that district, it will be seen that the mines are all good paying properties. The recent storms have interfered considerably with the work of the miners and in consequence a number of the mines have been closed for a short time. Bradley & McClellan, owners of the Big Elephant, are doing considerable work. About two weeks ago they had a quantity of ore worked at the Candelaria mill and the result was very satisfactory. They now have about four tons of ore on the dump which will average \$130 per ton in silver and \$9 in gold. M. M. Comstock has an eastern extension of the Big Elephant and his prospects are excellent. He has a shaft down 80 feet with a ten-inch ledge therein which carries ore that will go \$110 in silver and about \$13 in gold. Mackey & Landey are working on the Rip Van Winkle. Their ore assays from \$60 to \$100 per ton in silver and 47 per cent lead. They expect big things from the sleeper, and if present indications are to be considered, their hopes will certainly be realized. Frank Maguire is working hard on his mine. His ledge is well developed and carries ore worth \$50 per ton in silver and 60 per cent lead. Frank has a good mine and is highly elated over his prospects. Four men are now employed on the Endowment mine, owned by Smith & Co. Eleven tons of ore are now at Candelaria to be worked, and the result is anxiously looked for.

#### Rebel Creek District.

**QUIN RIVER.**—Silver State, Jan. 11: T. F. Melody is down from the Quin river country. He says there are several prospectors at work in Rebel creek district. Frank Snapp has men at work on the

Rome ledge, which he thinks will prove to be another Ohio. The Ohio Company are working steadily on their mine and have developed very rich ore bodies. The Bartholdi, owned by Shone & Co., is looking well and producing considerable rich ore, principally gold.

#### Reese River District.

**MANHATTAN MINE REDEEMED.**—Reese River Review, Jan. 14: John L. Beveridge of Chicago, representing the Chicago creditors of the Manhattan Company, has by redemption of the real property and purchase of the personal property, succeeded to the rights which the Lander Company acquired at execution sale. The papers investing him with their rights were finally delivered yesterday, and the purchase money paid to the treasurer of the Lander Company, and to-day C. P. Soule has been disbursing it to the li-holders according to their respective rights. The amount paid for the redemption of the real property was \$38,940, and for the personal property, including the expenses attending its preservation, etc., since the sale, \$14,865, making the total sum paid \$53,805. In addition to this amount, Gov. Beveridge has arranged for the payment of some of the judgments against the Manhattan Co., and hopes at an early day to arrange for all. We understand he will pay the State and county taxes, amounting to over \$5000, and complete the contracts for the Free concentrators now in use, but as yet not fully paid for. By this transaction the Chicago people, who are men of wealth, business energy and character, have succeeded to the rights of the purchasers as to the mines and other real property of the Manhattan Company, and to the absolute title of all the personalty. They have already taken possession of the personal property and are providing for its safe-keeping as well as the preservation of the mines. We have reason to believe that the work of mining and reducing ores will be resumed at an early day and as soon as arrangements can be made to that end.

#### Spanish Belt District.

**BARCELONA.**—Silver State, Jan. 14: The work of development is pushed ahead energetically in the Barcelona mine and good ore is still encountered. The indications point to the uncovering of big bodies of ore in the near future.

#### Ward District.

**CONTRACT.**—Silver State, Jan. 14: John Martin, of Ward, has secured the contract from the Martin White Co., to sink a 100-foot shaft on the Young America ground. He has started in on the work.

#### ARIZONA.

**MOHAVE COPPER MINES.**—Cor. Mohave Miner, Jan. 14: The recent raise in the price of copper has created quite an active interest in copper properties, and your correspondent, learning of the activity in this direction, has hunted up some information. There is evidently a decided local move in copper and some sales are rumored, but nothing definite as yet can be learned. Messrs. Merrill & Lewis returned Friday of last week from doing the assessment work on two big copper mines and from them some little information is gained in regard to some of Mohave's copper properties. These mines are some 40 miles south of Kingman, on the west side of the Wallapai range, and about 12 miles east of Yucca, on the A. & P. railroad. There are a number of locations in the district, but on only two of which has work been done. One of these mines is the Antler, owned by Messrs. Mackenzie & Rosborough, and is located in a little range of foothills, with almost a natural wagon-road direct to the mine. The ledge is fully 100 feet wide, and in every instance where any work has been done a fine grade of copper ore has been struck. The greater part of the work has been on the north side of a shallow ravine, the ore having simply been quarried out. In the center of this big excavation a shaft has been sunk 50 feet, and a 14-foot crosscut run, showing that number of feet of solid ore, without having struck either wall. Lower down the wash is another shaft, while on the opposite several drifts and cuts have been run, all showing ore. Some four miles further up into the main range, but on the same mineral belt, is the Copper World, owned by Messrs. Beecher & Co. This mine was worked some three or four years ago quite extensively, and shows, as the name would imply, a world of copper. Two drifts, one 65 feet and the other 250 feet, have been run into the mountain, cutting the vein at right angles. In the lower or longer tunnel a raise was started for air, while in the upper one drifts have been run each way along the ledge. Some very pretty specimens of ore were brought up from this mine, some of them showing native copper and copper sulphurets.

**LARGE LEDGE.**—Prescott Courier, Jan. 10: Theo. Boggs Hackberry is looming up, or rather down, grandly. The ledge is large and very rich in the new shaft, the depth of which is about 35 feet. Harland of the Howard led his animals out of the snow and has gone back to dig out more nuggets. John O'Connell, who is running a tunnel for Mr. Leavick, is in town, and says there is much snow in Hassayampa district. R. Cartmell is wanted badly on Big Bug to erect mining machinery. Geo. Merwin thinks of starting to-day to work Dorisore.

**MARTINEZ DISTRICT.**—Prescott Courier, Jan. 12: F. M. Murphy arrived Sunday last from the Congress mine, Martinez district, from which property he recently shipped several tons of ore, through the Prescott sampler, which yielded 23 ounces of gold to the ton. This is, of course, a big yield, but the mine itself is big in every way.

**WALNUT GROVE.**—A. E. Foote, just from Walnut Grove and the Castle creek country, tells of large and rich ledges seen by him in both districts. He found the Mayflower looking well. Placer miners were shoveling, rich gravel into their sluices. He was accompanied from Skull valley by Messrs. Barrett and Murphy.

**HASSAYAMPA.**—John McDonald walked to town yesterday from the Blue Dick mine, Hassayampa district. Himself and partner are taking plenty of rich silver out of the Dick. He came through deep snow, but arrived "as fresh as a daisy." The men who have leased the Lynx creek hydraulic diggings have not as yet started washing, but will do so shortly. They ought to take out a mule load of gold between now and dry weather. Sluice and rocker miners are catching considerable gold in Hassayampa, Lynx, Big Bug, Turkey Black canyon and

the other auriferous creeks. Now, while snow covers the hills and stops the transportation of ores, is a good time for mine-owners to work in tunnels, shafts and drifts; develop their properties and be prepared to let mine-hunters who will soon be here by the score see that we have in this section what they want.

#### COLORADO.

**TUNNEL.**—Elk Mountain Pilot, Jan. 12: The Pennsylvania tunnel is being developed in a satisfactory manner this winter. Mr. A. B. Williamson has Charley Devine working with him, who is a first-class drill-polisher. The tunnel is running on the vein and is in about two feet of good galena ore. Next to this ore body is a quartz streak, also containing some lead and gray copper. Doc Evans made a new location in Poverty gulch the first of the year and called it the Chicago lode. The Bonanza King lode, situated up Slate river, is being worked this winter under a lease by Doc Smith. The winter force has been increased on the Daisy mine, so as to push the development for a large output of mineral in the spring. This property is in Redwell basin, and is one of the coming heavy ore-producers of this country.

#### DAKOTA.

**MICA MINING.**—Custer Chronicle, Jan. 10: Recent inquiries with a view of securing the entire control of the production of mica in the United States, as indicated by a New York special telegram, appearing in our issue of last week, will doubtless have a very decided tendency toward bringing the mica mines in this vicinity into good request. Already evidence of a desire upon the part of mica men from abroad to secure interests here has been manifested by the arrival of two prominent gentlemen from Minneapolis, with the special object of securing a valuable mica property near this city. We are glad to state that the object of their mission was realized, and that operations will be resumed by the gentlemen referred to upon what is known as the White Spar mine at the earliest practicable day. Under the impetus which is liable to result from the mica pool now being organized in the East, it would not be surprising if all of the prominent mica mines in this vicinity would resume operations at no distant day.

**SHIPPING ORE.**—Black Hills Pioneer, Jan. 11: Horseshoe Comet Tuesday forwarded to Sturgis the first installment of a carload of ore the company is about shipping to Omaha. Superintendent Dorne was in the city last night, reporting that he has 10 men employed at present, most of them doing dead-work. Progress in the mine's development has lately been slow, owing to the fact that rock of a particularly hard character has recently interfered with rapid headway. It is probable the force employed at present will be augmented by several additional men next week. Tuesday's Rapid City papers state that on Monday, Harry Gregg brought to that city another report from the Castle Chief. The results of the work at the mine are very satisfactory, and Mr. Gregg and all others interested are to be congratulated. Frank Peck returned from Spruce gulch yesterday, where he has been engaged doing assessment work on the Dom Pedro and Skidmore lodes. In the tunnel on the latter claim, good ore, averaging \$60 per ton in gold and silver, has been found. The claims belong to Herman Bischoff of this city.

#### IDAHO.

**CEUR D'ALENE ORE SHIPMENTS.**—Butte Inter-Mountain, Jan. 14: A letter just received from Patrick Clark, general manager of the Poorman mine, by Chas. S. Warren, secretary, gives some interesting information concerning that great property and also concerning the ore shipments from other leading mines. He says: "The mine is looking about as usual. We have shipped 73 tons to date and will keep on as fast as the railroad will haul it. They are having some trouble with ice on the lake—not, however, with the new boat; but it is not able to keep the ore cleared away from the Mission. They are now going to run the old boat in the wake of the ice boat, and if successful the two will be able to get away with it all for this winter. There is more ore leaving this country than I expected to see this winter. The Sullivan is shipping daily 36 tons, Tyler & Stewardman 25, Sierra Nevada 10, Granite 15, Tiger 30, Poorman 25 tons. In our case we can only count on that amount for a short while, but with a 50-ton concentrator, we can keep it up without any trouble. The face of No. 2 tunnel has three feet of first-class ore to-day."

**THE IDAHOAN.**—Salt Lake Tribune, Jan. 14: J. S. Childs, superintendent of the Idahoan mine, is down from Wood River. He reports that the mine is being put in shape for pushing development. Bullion has been cut off from the outside world for two or three days because of deep snow and some slides, which blocked the road up the canyon. Mr. Childs speaks hopefully of making the Idahoan a good producer next summer.

**THE MINNIE MOORE CLOSED DOWN.**—It appears to be the general impression among mining men from Idaho that the closing down of the Minnie Moore bad, for one of its chief objects, the reduction of wages to miners. That and all other companies have been paying miners \$3.50 per day, and now that the mine has been closed four weeks, it is reported that men will be put on at \$3 per day, and if enough offer at that price, the property will start up again.

**QUARTZBURG.**—Idaho Statesman, Jan. 7: David Coughanour of Quartzburg arrived in this city on Thursday. He says that there is considerable snow in that section which has the tendency of bringing smiles to the faces of the placer miners, as their chief reliance is water. New developments have been made in quartz—some high-grade ore has been found in the Pioneer which will tend to make more work and business lively.

#### MONTANA.

**WEST GRANITE.**—Inter-Mountain, Jan. 16: The West Granite has been from 1 foot to 18 inches of pay ore. The Hecla Co., at Glendale, is erecting a large roaster to dispose of the large accumulation of flue dust. The Granite Mountain's output for the

last week in the year was 53,570.17 ounces of fine silver and 30.48 ounces of gold. The decrease was owing to giving the men a holiday. In the Bamboo Chief, Jefferson county, the other day, a four-foot vein of fine smelting ore was struck at a depth of 50 feet, and the managers felt so encouraged at the prospect that they immediately let a contract to have the shaft sunk 70 feet further, and will proceed to erect steam hoisting works.

#### NEW MEXICO.

**SILVER DELL.**—Silver City Enterprise, Jan. 14: The strike in the Silver Dell at Georgetown is said to be a big thing. If it is all that is claimed it will help the camp wonderfully. Eight silver bricks, valued at about \$10,000, were this week shipped from Georgetown by the Commercial Mining Co. Seven bricks were shipped from that camp last week. This is as good a showing as any camp in the country can make. It is a matter of doubt whether the Bremen mill can be kept running much longer, as the miners will not bring in their ore. It has been kept busy the last week on ore from Cow Springs, but there is difficulty in getting teams enough to haul the ore. There is plenty of ore in the country, but for some reason the miners will not haul it in. The sale of the old Pacific mine at Pinos Altos to St. Louis parties was not unexpected, as many different parties have been anxious to purchase the property for months past. The price paid for the mine is \$40,000, \$5000 of which is in cash. The Pacific was worked quite extensively in years past and was always one of the best producers at Pinos Altos. Work was suspended when the rebellious ore was reached. Since that time the title has been vested in a number of minor heirs; consequently nothing could be done with it until recently. The ore body is from 10 to 18 feet in width, and is considered high grade for gold ore. C. H. Wilkie, who has the contract for the erection of the Key mill at Pinos Altos, was in Silver this week, and reports that he now has about 25 men at work on the foundations and is preparing timbers for the new mill.

#### OREGON.

**CHLORIDE MINING CO.**—Bedrock Democrat, Jan. 11: This property is improving with depth and shows a fine body of ore having an average width of about four feet. The ore is free milling and most of the samples were taken to get an average value of the ore and not to show big assays. Average for 19 samples, \$127.96 per ton. Assays by Fox & Bacon, assayers, Baker City, Oregon. The returns from ledge sample shipped to the Portland reduction works from No. 1 are \$74.36, and No. 1, second grade, \$45.16 per ton. Mr. T. R. Bentley, the superintendent, reports that in No. 7 crosscut the ledge is ten feet wide. Some fine specimens of ruby silver have lately been found. F. K. Remington of La Grande is at the mine building track and getting out mining timber. Work on the tunnel is being pushed night and day. The property being only 11 miles from Haines station can be worked all winter.

**AT WORK.**—Jacksonville Times, Jan. 13: Des-selles & Connell, Simmons, Eunis & Co. and Wimer & Sons of Waldo precinct, Josephine county, are busily at work and will no doubt make a good showing this season. The miners are anxiously awaiting the end of the cold snap, as all are ready for an extended run. Should there be plenty of water this season the gold product will be large. The cold weather has suspended mining operations, but there is every probability that the frosty snap is at an end and there will be plenty of water when the first rain falls, as the ground was well soaked before the snow fell. A correspondent of the Times, under a late date, writes that W. J. Stanley of Woodville has started his arastra near that place and feels quite hopeful for the future of his ledge, as the quartz prospects well. It is said that parties from Portland are negotiating for the purchase of the property, and will probably put up a large mill on Evans creek, near Woodville.

#### UTAH.

**SULPHUR SHIPMENTS.**—Salt Lake Tribune, Jan. 14: The Dickert & Meyer Sulphur Co. are sending out refined sulphur at the rate of three carloads per week. They have a capacity at the mines of 20 tons per day, and this is susceptible of increase to any extent desired according to the demands of the market. The mines are located 26 miles from the Utah Central at Black Rock. Three teams, six horses each, are required to haul the sulphur to the railway, where there is a large warehouse, now filled partly with 300 tons, while at the works there is 250 tons ground, 50 tons flower of sulphur, and 500 tons lump, or such as has been taken from the furnaces in a pure state, ready to be ground or sublimated ready for market. These sulphur mines are the most interesting in America, in fact are the only mines of any extent, to produce sulphur. Only two furnaces are running at present. The mine is opened by cuts to the depth of 35 feet, exposing lots of ore, some of which runs as high as 98 per cent sulphur. The sulphur sent to market is practically chemically pure. The company employ at the mine and furnaces 35 men, 20 woodchoppers and numerous teams for hauling wood besides the teams to take out the commercial sulphur. Mr. Dickert was at the mine last week and found it under a deep coating of snow, but he brought away some fine specimens, some being so pure that when lighted by a match, burned and melted so as to run like heated butter. Mr. Dickert, in talking with a Tribune reporter, said that there was imported into the United States annually about 200,000 tons sulphur, while there was extracted from pyrites iron and copper ores 600,000 tons more in the manufacture of sulphuric acids, and if he was in better health he would feel like establishing here the manufacture of gun and other explosive powders, sulphuric acid and one special branch much needed, that of a manufactory of fertilizers in which sulphur and bones would form the chief ingredients. Sulphur extracted from pyrites contains arsenic in greater or less quantities; an article particularly beneficial in refining petroleum oils, for which such vast quantities are used, but unfitting it for many other uses in the arts. The Cove Creek mines supply most of the Pacific Coast with sulphur; ship east to Chicago, St. Louis, and would have a large trade with New Orleans if the railways would enable the company to send there,

1850. 1887  
**RANKIN, BRAYTON & CO.,**  
 BUILDERS OF...  
**MINING MACHINERY.**

San Francisco: 127 First Street. Chicago: 100 N. Clinton. New York: 145 Broadway.

PLANTS FOR GOLD AND SILVER MILLS, embracing machinery of LATEST DESIGN and MOST IMPROVED construction. We offer our customers the BEST RESULTS OF 35 YEARS' EXPERIENCE in this SPECIAL LINE of work, and are PREPARED to furnish from SAN FRANCISCO or CHICAGO, the MOST APPROVED character of MINING AND REDUCTION MACHINERY, adapted to all grades of ores and SUPERIOR to that of any other makes, at the LOWEST POSSIBLE PRICES.

We are also prepared to CONSTRUCT and DELIVER in COMPLETE RUNNING ORDER, in any locality, MILLS, CONCENTRATION WORKS, WATER JACKET SMELTING FURNACES, HOISTING WORKS, PUMPS, IN 3 MACHINERY, ETC., ETC., of any DESIRED CAPACITY.

# THE HAZELTON BOILER.

## A NEW AND RADICAL DEPARTURE IN STEAM GENERATOR.

DESTINED TO REVOLUTIONIZE ALL FORMER METHODS. A SAVING IN FUEL OF AT LEAST 25 PER CENT GUARANTEED OVER ANY OTHER STYLE OF BOILER.

**PACIFIC IRON WORKS, San Francisco, Cal.**

## DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a snitable

## Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

CAPACITY, 12 Tons in 24 Hours. 3 H. P.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patent and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machines in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

PATENT

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

This most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Smelting, Threshing and Stock raising, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Prices, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to JOHN TAYLOR & CO., Sole Agents, 114 to 118 Pine St., San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists  
Mining Companies, Milling Companies, Prospectors, etc.  
to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

## Forestry.

It is announced that the Forestry Commission will hold a meeting in their office in the Nevada block on January 24th. Messrs. Kinney and Bettner are expected to arrive from their southern homes, and John D. Spreckels, lately appointed as successor to Mr. Coleman, will take his seat in the board. Reports are expected from some of the large number of local forestry guardians which have been appointed, and other matters of importance are expected.

Word has been received from Senator Stanford that he will introduce a bill for the preservation of the forests somewhat different from that adopted by our board and submitted by them at the Santa Rosa convention. It has also been announced by telegraph that Senator Hale has introduced a bill, prepared by the American Foresters' Congress, to preserve the forests. It withdraws from entry as forest lands all public lands of the United States more valuable for their timber than for agricultural purposes. It institutes the office of Commissioner of Forests and authorizes the appointment of four assistant Commissioners. The Commissioner is instructed to form forest land into what are designated as forest reserves. He is given power to frame rules and regulations for the government of these reserves, and to appoint rangers to see that the rules are observed. No forest lands are to be sold, but the stumpage on them may be disposed of in the discretion of the Commissioner of Forests.

It is evident that more public attention is being drawn to forestry in all its branches than ever before in this country. The idea of preservation of forests from illegal and wasteful destruction is gaining force by public opinion and by the prosecutions which the Government is conducting against trespassers. It is certainly true, as has often been pointed out in our columns, that effective measures should be adopted to prevent our new country from following the hard experience which older countries have undergone and from which they are now putting forth such vigorous efforts to recover.

## Meetings and Elections.

CROCKER M. Co., Jan. 17.—Directors, Wm. Lyle (president), C. H. Fish (vice-president), A. W. Havens, Geo. Frier and Con O'Connor. August Waterman, secretary.

BLACK DIAMOND COAL M. Co., Jan. 14.—Directors, Thomas Bell, P. B. Cornwall, J. B. Haggins, Alvin Hayward and S. P. Smith. At subsequent meeting of the newly-elected board P. B. Cornwall was re-elected president and James H. Dobinson secretary.

SAN FRANCISCO GASLIGHT CO.—Directors, Joseph Durbrow, E. E. Eyre, Adam Grant, J. B. Crockett, Levi Strauss, James M. Donahue and D. T. Murphy. The only new names are James M. Donahue in place of P. J. Donahue and D. T. Murphy in place of J. B. Randol.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco:

EXCELSIOR CONS. M. Co., Jan. 14. Location, Calaveras Co., Cal. Capital stock, \$5,000,000. Directors—D. M. Kent, D. H. Ward, S. Forman, S. S. Maser, S. L. Prindle.

SANTA CLARA MOLOING CO., Jan. 16. Object, dealing in picture-frames and moldings. Capital stock, \$50,000. Directors—Wm. Frank, Samuel McCall, P. E. Frank, Wm. C. Frank and A. H. Martin.

## Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## Sample It.

Three select samples and three future issues of the *Illustrated Pacific States Weekly* will be sent, postpaid, to any address on receipt of 25 cents. Office, 220 Market street, S. F.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOGAN—Santa Clara Co.  
JOHN G. H. LAMPADUS—San Benito Co.  
G. W. INGALLS—Arizona Territory.  
WILLIAM POOL—Fresno Co.  
WM. WILKINSON—San Joaquin and Stanislaus Co.'s.  
A. F. JEWETT—Tulare Co.  
E. H. SONAEFFLE—Placer, Sacramento, El Dorado Co.'s.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
R. G. HUSTON—Montana Territory.

## About Stopping This Paper.

We particularly request any one receiving this paper, who does not wish to continue it, or who does not intend to pay for it, to send written notice of that fact to us. Of course, this does not apply to those who for good reasons know that the paper is sent to them complimentary. In sending word to the publishers, be particular to note all of the following points: 1st, to send it to the P. O. by a trusty hand; 2d, to be sure you have a stamp on it; 3d, that it is correctly addressed; 4th, that your name is plainly written; 5th, that you give the name of your P. O.; 6th, that you give the name of the paper (or we should have to look over the long lists of subscribers on several newspapers). If your letter reaches us with any one of the above points overlooked, we should have to look over thousands of addresses to find your name to discontinue your paper. By missing one or more of the points above enumerated on the part of subscribers, we are doubtless often blamed for not stopping papers when it is impossible for us to do so, and in many cases receive no intimation even about the matter.

## Books on Assaying.

By C. H. AARON.

## PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning.

The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

## Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorchification; Cupellation; Weighing the Bead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Materials; Solubility of Metals; Substitutes and Expedients; Assay Tables.

The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market street, San Francisco.

## PARTS II AND III.

## Lead, Copper, Tin, Mercury, etc.

Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

## Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Processes; Preparation of Potassium Cyanide; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Sulf; Appendix to Part I; Notes on Crucible Assay; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper.

There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price, postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

**H. H. H. HORSE LINIMENT.**  
THE H. H. H. Horse Liniment puts a new life into the Antiquated Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all character. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

Over 300 in use. All estimates guaranteed. Send for Circular.

MINERS' HORSE WHIM.

All wrought iron. No gears, no breakage. One horse will easily handle rock or water to a depth of 350 feet, giving entire satisfaction to the prospector. Price, complete, \$200. 150 sold on this Coast.

NATIONAL ROCK DRILL.  
200 Sold on this Coast. Has less repairs than any other Drill.

## NOTICE TO GOLD MINERS!

### SILVER-PLATED AMALGAMATED PLATES

For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER  
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.  
GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES FURNISHED ON APPLICATION.

SAN FRANCISCO NOVELTY AND PLATING WORKS,  
No. 108 FIRST STREET.

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

## ATTENTION, GOLD MINERS!

WE ARE SELLING

### Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 &amp; 655 Mission St., San Francisco, Cal.

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the Silver-plating, and in having much less Silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. SEND FOR CIRCULAR.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

## The Sergeant Rock-Drill.

After a thorough practical trial of the Sergeant rock-drill, a cut of which is shown on this page, the Ilex Mining Co. of Mokelumne Hill, Calaveras county, have ordered of the agents in this city, H. P. Gregory & Co., 14 drills of this make. They must have been well satisfied with the results accomplished by the machine to have given so extensive an order. The drill has an improved valve motion and rotating device which avoids some difficulties in ordinary drills and increases efficiency and durability. There have been many attempts made to construct a drill that would avoid the difficulties met both in tappet and steam-valve drills without adding new ones. The Sergeant was especially designed for this purpose. The makers claim that they have now perfected a drill combining all the good qualities of the tappet valve, which insure long life to the cylinder and piston and all the good qualities of the steam valve which give effectiveness. The valve in this drill is a perfectly balanced one, controlled by a single auxiliary valve moved by the piston in such a manner that durability and effectiveness are its permanent features.

In the Sergeant is a piston valve moved by the exhaust steam from opposite ends and an auxiliary slide valve moved by the piston to open and close the ports which control the movement of the main valve. This main valve is small, light and perfectly balanced; it is made of steel and hardened, and the time of its movement is not changed by wear or friction, oil or no oil.

There are no openings through the side of the cylinder, or ports for the piston to close in its movement; in fact, the piston and cylinder can be run and worn out without affecting the movement of the valve or the amount of work done by the drill. The auxiliary valve is also made of steel, with the ports on one side, and it travels in a groove which keeps it in its place. By placing the piston in the center of the cylinder and moving it back and forth for about half an inch, the auxiliary valve will move so as to open and close the ports which control the main valve, thus permitting a short stroke which can be used for blocking out holes. The arrangement of the auxiliary valve and ports is such that the main valve will not move until the piston or drill-bar strikes the rock when running full stroke.

By the arrangement of the openings or passages the valve is held in such a position that, while the piston and drill-bar is passing to the rock the exhaust remains open on one end, while the pressure remains on the other until the drill-bar is driven forcibly against the rock, at which time the valve will immediately reverse, having produced the most effective result.

The new rotating device has a release movement which prevents twisting of the spiral bar or breaking of pawls and ratchets. A strong steel spring is used instead of rubber for huffing, and only one spring at the upper end of the cylinder is required to prevent breakage by the piston striking either the front or back head.

The construction of the drill is such that it can be taken apart and put together in a few minutes. It is handled in the same manner as all percussion drills driven by steam or air.

The tripod has every adjustment wanted. The new patent clamp for holding the drill on the tripod, arm or column, has several ad-

vantages. The swinging jaw is brought to bear upon the cone on the back of the drill by a single bolt. The arrangement is such that the drill can be mounted and unmounted easily and quickly. The machine can be run loose on the clamps when required, and when tightened will hold with ease. Seven sizes of these rock-drills are now made, each having its special adaptation. The smallest has a cylinder of two-inch diameter and the largest, four inch.

The makers of this drill manufacture also a patent column and a patent quarry frame for

## The Copper Market.

According to all appearances the French syndicate, which cornered the copper market, will make a very good thing of it. These operations were far-reaching. They not only bought up stocks and that which was afloat, but engaged the product of various mines. The big Spanish and Chilean mines have sold to them and some mines in this country also. The directors of the Arizona Copper Co. have issued a circular in London in which official confirmation is given

## The Alien Land Law.

We have several times referred at length to the fact that the Alien Land Law Act has had a very detrimental effect on the mining interests of the Territories. The law applied only to the Territories, and was originally designed to prevent foreigners acquiring large bodies of land. Unfortunately, however, it was so carelessly drawn that it included mines as well. Now it happens that English companies have been investing heavy capital in mining in Idaho, Montana, Utah, New Mexico and Arizona, and would have invested more had this law not been passed. Of course they could hold the mining property acquired before the passage of the Act, but could not legally purchase any more. American miners holding claims were therefore unable to sell to foreign capitalists, and as American capitalists invest more readily in railroads, oil, stock, bonds, etc., and as a general rule care little for mines, the law worked a hardship on claim-owners. These English companies open their mines properly, put up expensive works and employ thousands of men. They have always benefited any mining camp they have invested in, and are looked upon favorably by the mining community.

There has been so much complaint about the law from the mining regions that Congress will doubtless remedy the matter this session. A bill to amend the law has been introduced by Senator Hearst of California, himself a prominent mine-owner. It is stated that the bill to amend the Act will be favorably reported by the Committee on Mines and Mining. The bill to amend is as follows:

"This Act shall not relate to or in any manner affect the title to mineral lands or mining claims in the Territories of the United States which have been acquired or held under the mineral land laws of the United States, nor to mills or other reduction works, or property used in the production of metals from said mineral lands or claims; but as to all such mineral lands, mining claims, mills, reduction works and other property the laws of the United States and of the Territories shall be and remain the same as though this Act had not passed."

It is to be hoped that there will be no hesitation among the members of Congress in passing this amendment. The law as it now stands is a serious drawback to the mining industry in the Territories. The mining regions all need capital to develop them, and if the English or French will help the miners in this way, there should be no law to prevent them.

PRESIDENT CORBIN of the Reading Coal Mining Co. says that the company has in the past 12 years mined 51,000,000 tons of coal and paid to miners \$57,110,000. He says, moreover, that the net proceeds of this coal have been \$44,834,000, leaving an actual loss of \$12,270,000. The coal has been from \$5 to \$7 per ton in Philadelphia all that time.

DURING the past month the shipments of quicksilver from Calistoga, Napa county, have been unusually heavy, the advance in price having been an inducement for superintendents to mine their best ore, and obtain as much of it as possible.

THE House Naval Affairs Committee has agreed to report favorably to the House Mr. Morrow's bill appropriating \$175,000 for the repair of Admiral Farragut's old flagship, the Hartford.

THE SERGEANT ROCK-DRILL.

the drills. The rotation device in this drill is a specially effective one. The ratchet has internal teeth which are very durable. It has, in many instances, run for a year without any special care, and found to be in good order.

THE latest discovery of a gold mine in the East is 15 miles from Washington. Those interested have bought over 800 acres of land where there is "high-grade ore," averaging \$33 per ton. Wisconsin and Pennsylvania capitalists have gone into the scheme; but "800 acres of land with high-grade ore" sounds amusing to miners.

THE monument to Francis Scott Key, which was made in Italy, arrived in San Francisco this week, and will be at once placed in position in Golden Gate Park.

of the sale of the Arizona product to the French syndicate. The circular says the whole output of copper has been disposed of for three years on terms considered highly satisfactory to the board. It was the desire of the directors that the contract should be submitted to the stockholders for their approval, but the negotiators objected. The precise terms of the bargain are withheld under the stipulations, but the directors say that, basing their calculations throughout on the minimum estimation of production and on the minimum price stipulated in their new contract, they believe that the annual revenue from all sources for three years up to the 31st of December, 1890, will, on an average, be about \$80,000 per year. If the production can be maintained at what the board regards as its normal quantity, that amount will be considerably increased.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

## Mining Regions of the Northwest.

EDITORS PRESS:—It is many years now since I had the pleasure of writing anything for the MINING AND SCIENTIFIC PRESS, which, from the first date of its existence, has always been such an able and faithful advocate of our mining interests. After the lapse of years, and perhaps the most energetic and costly mining operations ever known in the world, those interests do not bear the same importance to California in general, and San Francisco in particular, they did a quarter of a century ago. Other interests have superseded them in a measure, and we have now to look to the great Northwest—Montana, Idaho and Dakota and the Inland Empire, composed of Washington Territory and Oregon—for the mineral wealth which is to uphold the predominance of the Pacific Slope it has so long held in the production of the precious metals.

But, though placer digging is not what it was, though hydraulic mining is prohibited by law, and though the glory of Washoe has become a tradition of history, I feel assured the spirit and enterprise of our people, which built up the Pacific Slope, has not died out, and that they will be glad to know something more than they do of the vast extent and endless wealth of the Northwest in its recently discovered silver-lead mines, reaching from Cœur d'Alene, in Idaho, to Wallawa county, in Eastern Oregon, a distance but little short of 300 miles.

Nearly three years ago I relinquished journalism in San Francisco to go to Cœur d'Alene, and so was on the spot when the great Bunker Hill and Sullivan mines were discovered. I have not space in one article, a mere sketch too, as this one is, to go into details of the capacity and produce of all the principal mines in Cœur d'Alene; but, I can safely say, for unbroken continuity and general richness they have no equal to-day, nor ever had before in any period of the world's mining history. The total length of the silver-lead mines in Cœur d'Alene is just 65 miles and 15 miles in width, beginning at Wolf Lodge on the lake and ending at the Montana boundary line. The south fork of the Cœur d'Alene river from Old Mission, where it joins the lake, runs pretty straight due east and west to the Montana boundary line. Along this river, at every two or three miles, are long ravines on both sides, not at all difficult of access, on which the mines are located. Passing over Pine and Government creeks to Milo creek, on which Wardner is located, we reach the first great mines of the district as proved by development. The Sullivan, on the southeast side of the creek, is now tunneled 1000 feet deep and over 600 feet into the hill. The vein has run from 10 to 50 in width, averaging 30 feet, and the ore in the lowest tunnel now pays \$150 to the ton. The Sullivan and its sister mine, the Bunker Hill, were recently purchased by Mr. Sam Reed, a leading capitalist of Portland, for \$1,500,000, and if worked to their utmost capacity and with the same vigor the mines at Washoe were worked, and the mines at Butte City and Leadville are worked, it is not an exaggeration, taking the average pay from the first as a guide, to say they would easily yield \$5,000,000 a year. At present they are not worked to their capacity or anything near it. On the same ledge to the northwest are the Lackawanna, Homestake, Richmond, Emma, Stenwinder, Tyler and Sierra Nevada, all of which are producing mines, and as great in pay and capacity as the Sullivan and Bunker Hill; but I have always held the Sierra Nevada will prove the richest silver-lead in America when thoroughly opened and worked to its full capacity. It is now paying \$18,000 a month.

Twelve miles above is Wallace, another new town, growing up rapidly in importance from being the center of an immense number of great mines and from being at present the terminus of the railroad. In this section are the Tiger, held at \$500,000; the Poorman, recently sold for \$300,000, and a number of others on Canyon creek, bonded and sold for sums ranging from \$15,000 to \$40,000, the ultimate value of which, however, is now greatly increased by Mr. Glidden's railroad which goes from Wallace up the canyon to the mines. The Gem, Badger, San Francisco, Oreonogo, Black Bear, Diamond Hitch, Granite, Black Cloud, California, Monarch and many others in this section, are all great mines. Nine miles above Wallace comes Mullan, the last settlement of Cœur d'Alene near the boundary line of Montana. In this district, containing about 15 square miles, there are 142 recorded locations, 90 of which will prove valuable mines. Among these are the Hunter, sold last year to Dennis Ryan of St. Paul for \$100,000, and cheap at that, in fact, one of the biggest bargains of the year; the Morning and Evening lodes, sold for \$40,000, with a host of others I have not time to recapitulate.

Passing on through Montana to St. Regis and Salmon river, the formation shows itself in equal splendor until Wallawa county in Eastern Oregon is reached, nearly 300 miles, and thence to Pine creek, some 200 miles farther. In Wallawa county, where I am now personally interested, the veins are not so wide, so far as known, but the surface ore is much richer, run-

ning on an average at the very grass roots from \$65 to \$350 a ton. In addition to the silver-lead mines in this section, there are marble, tin, zinc, and other rich productions, with the finest possible climate for working and opportunities for tunneling to any depth. Our tunnel is now in 200 feet with probably 90 more to go, and will be finished by April. I think the results of the tunnel will cause an immense excitement. The ledge here is developed, in a measure, for 30 miles. The marble, at present prices, ranges from \$6 to \$8 a cubic foot, which makes it worth from \$72 to \$96 a ton, and we can lay it down in Portland and San Francisco at \$50 a ton profit, and supply the whole coast. Several of the leading marble men of Portland and San Francisco have examined my samples and all pronounce them of the very purest character.

It has been said, "once a Californian always a Californian." I landed in San Francisco in 1849, and seeing the State grow up from a wilderness, I have been a very earnest and very sincere Californian. But my experience during the last year compels me in all honesty to confess that, to-day, for mineral and agricultural wealth, Oregon is the richest State in the Union. The connection of the two States by rail will do for the Pacific Coast precisely what connecting the two oceans by rail did for the whole nation. It is one of the grandest works our people have ever accomplished, and by consolidating the interests of the coast from San Diego to Puget Sound, it makes it a world within a world, greater and grander than the continent of Europe, because the home of freemen who have a free-simple right in the land, and because it teems with everything required to increase their wealth and happiness. Even in well-informed circles in San Francisco, I find, the grossest ignorance prevails about the varied resources of Oregon and the Northwest. But railroad connection, which makes travel cheap, easy and expeditious, will soon dispel this ignorance and compel a progress in those far-off regions which no one can dream of now. The future growth and greatness of the Northwest, from Oregon to Cœur d'Alene, will be even more wonderful than the growth and greatness of California has been—for it is based on a mineral foundation, which, though not so phenomenally rich as Washoe, is infinitely more permanent and cannot be exhausted for centuries.

LEIGH HARNETT.

## Mexican Mines.

## The Minas Prietas in Sonora.

EDITORS PRESS:—The history of the Minas Prietas, in Sonora, shows that sometimes there are opportunities to make of an abandoned mine a profitable one, provided it is undertaken with a combination of good judgment and sufficient capital. The Minas Prietas ledge is a large one, sometimes 100 feet between walls, and the pay streak varies from 4 to 20 feet, narrowing and widening alternately. The bulk of the mineral is a low-grade free-gold ore, easily worked by amalgamation and carrying a varying quantity of silver ore, sometimes as high as 10 ounces silver per ton, of which, however, no account is taken in the working of the gold ore, consequently it is lost in the tailings, because, as I am informed, it cannot be saved by concentration.

The mine was discovered and worked more than 100 years ago for the Marquis of Coloma, a grandee of Spain, but for silver only, to a depth of merely 90 feet and then sold to different parties alternately, who worked or tried to work it with varying success and unsuccess till it came into the hands of an English company. Only then began the serious development and profitable working of the hitherto quasi-neglected property. The deep working of the mine began, shafts were sunk and drifts run, which proved a large quantity of pay ore below, and which justified the building of a fine mill capable of running 80 stamps and 20 combination pans, though for the present there is only half of this machinery in place. The plant of the mill consists of four tubular boilers 16 feet long, of a splendid automatic cut-off engine of five-foot stroke, with fly-wheel 16 feet diameter and main pulley and belt 43 inches wide, which are used to set in motion 40 stamps, 10 combination pans, 5 settlers and one or two smaller pans. All this machinery was built at the Union Iron Works, San Francisco, and speaks for itself, so loud, in fact, when running, that one can hear it a mile off. The water used in the boilers and in the mill is pumped out of the mine, and, not having too much of it, is pumped from the tailing reservoir back to the mill again, where it is used over and over in the batteries or in the pans.

The English company has now worked this mine for about five years, and formerly ran about 160 tons of ore daily through the mill, till some years ago it was proved that by closer working, i. e., grinding, the daily yield of 100 tons would equal the former yield of 160 tons. Of course this better method of amalgamation was adopted, and the average work was 100 tons daily; last year 37,000 tons of ore were worked, yielding about \$10 to \$12 gold per ton.

Owing to various causes, only tailings were worked this year, which keeps pans and settlers and a reduced force of millmen busy, while the stamps wait in gloomy silence for their daily feed of ore, which is now sought for

on and below the 600-foot level; and it is expected that soon the voracious jaws of the rock-breakers will be set to swallow tons and tons.

Next time I expect to send you some details of another large mine—a silver mine—acquired by an English company. While Sonora is, so to say, at the door of California, there are only a few California miners here, and few, if any, specific California companies at work; while the Eastern capitalists and the English are on the lookout and not slow nor afraid to avail themselves of the chances occasionally to be had. Millions of English and Eastern capital is thus employed—profitably, too, when carefully invested and intelligently and honestly administered, as this sketch has tried to show.

THEO. G. E. WOLLEK.

Hermosillo, January, 1888.

## Natural Gas in California.

A few miles from the new town of Sutter City, near the road passing through the Buttes toward Meridian, a shaft was sunk some 16 years ago by parties prospecting for coal and other minerals. The shaft was about four feet in diameter and was carried down to a depth of about 40 feet. One day a man named Cook was working in the bottom of the shaft, and as he struck a blow with his pick a rush of gas came forth. It ignited from the flame of his candle and a violent explosion followed. The flame immediately rose to the top of the shaft and the windlass was blown away. Cook was thrown down by the force of the explosion, and his fellow-workmen at the top of the shaft had a great deal of difficulty in rescuing him from his dangerous situation. They first smothered the fire by covering the shaft, and then succeeded in raising him to the surface. At that time no one supposed that natural gas had any value, and work was abandoned in the shaft. It was subsequently covered over with boards and brush, in which condition it remains to this time.

The land on which this shaft is situated is owned by Eli Davis, and is used by him as a sheep ranch. He has recently become interested in the subject of natural gas, and means to take steps for the development of the prospect on his place. He visited the shaft the other day, and was well pleased with the indications. Some time since a short piece of iron gas pipe, an inch in diameter, was thrust through the boards and rubbish covering the shaft, so as to permit the escape of the gas. The gas readily lights from this pipe, and continues burning until blown out by the wind. Mr. Davis saw it burn the other day for a full hour, and he could see it still burning after he left the spot. It is probable that a company will be organized shortly to develop the excellent prospect of gas now afforded by the shaft.

The value of the natural gas annually consumed in the United States is estimated at about \$10,000,000. Many towns and cities use it for light and heat in the coal and oil regions of Ohio and Pennsylvania. The gas is carried many miles in pipes from place to place, as the pressure is usually great. Should a good supply be tapped in the Buttes, it would create a great boom for Sutter City, which would at once be provided with cheap fuel for manufacturing and all other purposes, and be brilliantly lighted by gas at a small expense.

The Buttes may yet prove to be rich in mineral wealth of various sorts. A gold placer has been worked in them, and good prospects of coal have been obtained. Near Sutter City there is a quarry of building stone from which a house has been constructed. Recently a substance supposed to be mineral paint has been discovered near the quarry, and a white material, believed to be porcelain clay, has also been found. The field is worthy the careful attention of prospectors.—*Marysville Appeal*.

NOT WORKING THE BORAX MINES.—Richard B. Flynn, owner of a silver mine in Inyo county, told an *Examiner* reporter that nearly all the borax mines of Inyo, San Bernardino and El Dorado counties have virtually ceased work because of the low price of borax. W. T. Coleman's large borax works in Death valley, John Searls' works in San Bernardino, and numerous others that were employing from 35 to 50 men each, are now working but a straggling half dozen or less, and some are not doing anything.

PETER F. CLERC has brought suit against the Hubert Concentrator Company to enjoin it from alienating its letters patent. As he alleges that the corporation is insolvent, he also asks that a receiver be appointed to sell them in satisfaction of a default judgment for \$216.50, obtained by Clerc and Joseph C. Stebbins in June last, the letters being the only property upon which execution can be levied.

CAPTAIN SMITH'S coal mine on the line of the California & Nevada railroad has not proved to be a mine of wealth, and further experimenting has been dispensed with. The vein as it appeared was only a few inches in thickness. Captain Smith says the coal was good what there was of it, but there was very little of it.

THE Coronado Beach Co. has concluded hereafter to use crude petroleum as fuel exclusively on the ferry-boat, motor line and hotel machinery.

## Utilizing Flax Fiber.

The idea of using home-grown flax fiber to supplant the large quantities of twine and other manufactured articles which are now brought here from a distance has been a recurring subject for discussion for years. Several efforts have been put forth to establish factories which it was hoped would begin with coarse linen manufactures and gradually work up to higher and finer products. For some reason or other these undertakings have not hitherto reached a successful basis, but it is encouraging to know that effort is still being put forth, and it certainly appears, upon *a priori* grounds at least, that we should have manufactures of this kind in profitable working. The latest announcement looking in this direction is the starting of a twine factory in East Oakland adjoining the cotton-mills. The *Chronicle* gives this account of the origin of the enterprise:

"The manager and principal owner, Mr. Bruce, was formerly in the employ of the cotton-mills, and during a visit to the coast counties saw some samples of flax straw which he recognized as equal to the best French flax, and the idea occurred to him that its manufacture into twine could be made profitable in this State. Considerable flax is grown along the coast for the seed, which is sold to the linseed oil factories of San Francisco, but the straw has heretofore been thrown away as useless. He interested a few capitalists, among them Daniel Suter of San Francisco, and the plant for the mills was procured. About one dozen machines are now in operation manufacturing flax twine, which commands a price in California that makes the manufacture profitable. Mr. Bruce, who has had considerable experience in the flax industry, as operated in Scotland, states that the coast soil, with its damp, foggy climate, is peculiarly adapted for flax growth, producing a strong and fine fiber. The more fog the better for the fiber. The straw, he states, is as valuable as the seed, and farmers may thus make a double profit. An acre will produce two tons of straw and 1000 pounds of seed. The straw is worth about \$12.50 per ton and the seed 2½ cents per pound, or a gross income of \$50 per acre."

We do not vouch for the estimate of crop and values. It has been claimed by some that the condition required in seed and in fiber by the users of each prevented both from being utilized from the same plant; that a plant which fully matured its seed had gone too far to yield the best fiber. We are not practically informed on that subject. We know, however, that where the flax industry is important, as in some European countries, they have different varieties of flax, of higher growth than the seed flax grown in this State, which are advocated by fiber growers. A collection of fiber varieties was secured some time ago by the State University and has been grown from year to year at Berkeley.

## Mining Camp Nuisances.

There is much complaint in Idaho and Montana of a class of blackmailers in the various mining towns and camps, who will allow no important sale of mining property to proceed unless they are bought off; otherwise they interfere with the proposed sale in every possible way. They decry the mine as an ore-producer, assert that it will not prove permanent, or hint that there will be trouble in regard to the title. As the reputation of a mine is about as tender as that of a woman, a mere hint is often enough to break off a sale. It is not only in Montana and Idaho that such men are to be found. They hang about all mining camps and come to the front whenever a big sale is about to be consummated. Unless their mouths are closed with a golden seal, there is nothing too bad for them to say of a mining property that is about to be disposed of for a large sum. In the early days of the Comstock a good deal of this dirty work was seen.

Besides the regular blackmailers, there is in every camp a class of envious persons who have mining claims on which they have for years been incubating, merely doing "holding work," who cannot endure to see men of capital come into their camp and open negotiations for any other property than their own. These men will get around and interfere to break up a sale, hoping to dispose of a claim owned by themselves if they can alarm the would-be purchasers in regard to the mine for which they are negotiating. The result generally is that the men of capital either become frightened or disgusted, and, folding their tent like the Arab, steal away. Another nuisance in a mining camp is the class who come to the front the moment a rich strike is made in a mine. Then they rush in with a capped-up claim of some kind to the property. It is either on the extension of a vein they are working or is on ground located by them at some time. These fellows will allow men to hold peaceable possession of a piece of mining ground and expend on it coin and labor for years without saying a word, but when a big strike is made they are as noisy and ravenous as coyotes.—*Virginia Enterprise*.

A DUMMY ROAN at Monterey is to be built to connect the Hotel Del Monte, Monterey, New Monterey, Pacific Grove, Point Cypress and Pesadero beach.

## Driving the Jack-Rabbits.

We present on this page an ideal sketch of one of the rabbit-drives which are becoming so popular on the plains of the upper San Joaquin valley. The plan first put in practice near Pixley two months ago, and since repeatedly pursued there with so gratifying results, has been adopted in Kern county with even greater success.

The Bakersfield people celebrated New Year's Monday with their initial round-up of the rabbits, at Henry Borgwardt's ranch, four miles from town, westward. There was a circular corral at the corner of his alfalfa-field where the sagebrush and pasture lie side by side. From this inclosure two wings of lath fence were stretched at right angles for a few hundred yards.

By 2 o'clock in the afternoon a large number of people had gathered, some on horseback,

cruel sport, but their destruction is an inexorable necessity. Relentless war must be waged against them or they will take entire possession of the country."

Our picture calls for but little explanation. The upper left-hand corner gives a ground plan of the fence. The line of beaters would of course be thrown much farther off and more in the form of a semi-circle at the beginning of the drive while the persons would be more widely scattered.

This method of dealing with the destructive rodents bids fair to become quite general, where they abound and the lay of the land favors; and as our "rabbits" are all *hares*, which know not the trick of escaping into burrows, the results of the process are comparatively certain. The conceit of the artist in the lower corner must be a melancholy reminiscence of the days before drives were introduced.

At Bakersfield, Kern Co., on Jan. 10th there was a great rabbit-drive. The account of the affair given in the *Echo* of Jan. 12th is so sprightly, and contains so many valuable prac-

captains, were placed at the extreme right and left wings. The whole command formed a semi-circle.

When all were in position, the commander raised his handkerchief, the signal for the start; this was repeated by his assistants and the captains, and simultaneously the whole line began a quiet work toward the corrals. At first the rabbits trotted slowly ahead of the drivers, but soon the horsemen on the left wing opened up a general shout, *contrary to the program*, which so excited the rabbits that they turned toward the right wing and ever so hard work of those in charge of that wing could not keep half of them from passing the line.

As the circle gradually closed, the drivers made a more compact body, so that when they reached the rabbit-tight wings there was little chance for a rabbit to go back without encountering one of the clubs in the hands of the foot-men; hundreds of them were killed in this way.

Just before the gate to the corral was reached, there was a general disposition on the

## Mining in Alaska.

This is a poor country for a man without money or to go broke in. Miners' wages are only \$2 per day, and labor in the rain and snow at that. It has stormed 57 days out of 72 since I have been here. At this writing it is dry and cold—thermometer six degrees above zero. This is the worst country to prospect in I ever found. I tried prospecting for a week, and as a last resort went to work at my trade. I worked 61½ days at \$1 per day and boarded myself; bought a stove for \$26 and did my own cooking. I did the work on an 80-stamp mill and it is finished, but won't start to work before spring, as the company has no ore on the dump, and it snows two days out of every three on an average. White men will not work in the storms. Indians do nearly all the mining here. Men, women and children are compelled to wear rubber or oil clothing here. This town of Juneau is on the mainland. The two largest quartz-mills are on Douglas

IDEAL SKETCH OF A RABBIT-DRIVE AS PRACTICED IN THE GREAT VALLEY OF CALIFORNIA.

others in light vehicles. They had a commanding officer and a few field managers. No dogs were allowed upon the ground, and but a few guns in the hands of experienced sportsmen. The crowd having been so distributed and marshaled as to form a curving line about a mile in length, a signal to move forward was given and the drive toward the corral commenced. The area inclosed by the drivers must have been less than a square mile, but the *Echo* says that "as they drew near the apex of the triangle it seemed as if there were acres of rabbits. Of course a great many ran back past the people, and several hundred were killed with sticks while doing so, their fright being so great that they would run within a few feet of one's conveyance. When the corral gate was shut it was found that the drive had been a grand success. By actual count after they were killed, there were 1126 rabbits in the pen. Another march was ordered, and by passing over the same territory 796 rabbits were corraled and killed, besides a large number that fell by the way. It was generally believed that 2500 was a safe estimate of the total number killed in the two drives."

Of course no firearms whatever can be used inside the corral; only clubs are permissible. Another observer writes: "It looked like very

tical hints as to how a drive must be managed in order to secure the greatest success, that we quote it bodily:

In accordance with posters generally circulated about Bakersfield, a second rabbit-drive took place at H. L. Borgwardt's ranch, the same place as the former one. At 1:30, the hour set for the meeting, at least 500 people had assembled on the grounds, and after partaking of the generous lunch prepared by Messrs. Swain and Borgwardt, proceeded to the place where the drive was to be held.

Preceding this, Commander McCord had sent a large delegation of horsemen to "round up" the rabbits in the field west of that where the principal work was to be done, so that by the time the crowd was ready to move in a body to the place where the drive was to commence, hundreds of rabbits had been driven out before them.

Companies were rapidly organized, 20 men on foot being assigned to each captain who was mounted. Eleven companies of men and boys were given positions, and two of ladies and girls under command of lady captains; and it is claimed by those present that more enthusiastic hard work was done by the latter than by any one else. Two large companies of men and boys on horseback, commanded by competent

part of the rabbits to turn toward the crowd. Had the latter been held in check for a minute, so as to give the rabbits an opportunity to see the gate, every rabbit would have been captured; but there was no such delay, and the result was that nearly half of them went through the crowd.

It was estimated that 2000 were corraled this drive. They were speedily killed with clubs, and a second drive ordered. Commander McCord sent a large force of horsemen into the field north of the one where the main drive was held, to drive the rabbits in front of the companies, and it proved to be an excellent move, as it increased the count in the next drive by at least 1000. Aside from the shouting by those on horseback, the last drive was as near a success as any one could wish. At the close, when fully 3000 rabbits were massed in front of the gate, undecided which way to turn, the commander and his assistants held the crowd in check until the rabbits started for the gate, when a general rush was made, and in an instant 3000 more rabbits were in the corral. After the killing, a count was ordered and the number was 5075 in the corrals, and it was estimated that at least 500 were killed on the outside. This would total over 8000 rabbits killed inside of one week on a field of less than 300 acres.

island. The Treadwell mill runs 160 stamps. Their gold lode is 600 feet wide. The mountains are from 4000 to 5000 feet high, and all the canyons have large glaciers. I viewed one six miles in length. On Glacier creek there is one 26 miles in length—12 miles up the bay. The sun sets here at 3 P. M. and rises at 9 A. M. Times are duller here than in any California town I can think of. In winter all the idle men go to Puget Sound. The wind has been blowing terribly for four days, and I have abided most of that time by my stove. The mail steamer comes to visit us once a month, and it is with great anxiety I look for it. I am 700 miles from Portland. Via that place is the way to come to this country to connect with steamers. The fare from Portland to this place is \$50 cabin or \$30 steerage.—Juneau Cor. *Anderson Enterprise*.

MANY of the farmers and lumbermen in Northern Michigan are making use of dogs this winter to draw the sleds. It is said that the dogs become quite expert at the work after a little training, and in many ways equal the Esquimaux dogs.

A FLAX factory has recently been started in East Oakland.

## Passing Events.

It is not often we are called upon to chronicle disastrous and fatal accidents in the coal mines of this coast, but an explosion occurred this week in the Wellington mines by which many miners lost their lives. An account of the accident is given in another column.

The warm rains of the past week have melted the ice which formed during the cold spell, and a number of mills which were closed down have gone to work again.

The people up on the Comstock are about to use compressed air instead of wire rope for transmitting to the surface the power generated by operating the Pelton water-wheel underground in the C. & C. shaft. The old project of utilizing the power in the Carson river for compressing air to be used at the mines is also again being talked of.

Efforts are being made in Congress to amend the Alien Land law so that its provision will not apply to mining property. It will be but justice to the mining community to change the law as it at present stands.

The burning of iron-stone sewer-pipes has been commenced at the Clark Pottery Works, Alameda. There are orders enough on hand to keep the works running for the coming six months to supply the demands in the southern part of the State alone.

From 50 to 60 degrees below zero was the record last week at a dozen places in Central and Western Montana.

## California Mining Machinery.

In a recent number of an Australian journal was published a report of the Government Geologist and the Government Chief Inspector of Mines on a plant of machinery for the working ores, which was sent there from California by a San Francisco firm. The plant received the highest praise from these officials, who especially commended the labor-saving features. They also called special attention to the concentrating machinery and the effectiveness of the Frue vanners. Their published report was in the highest degree complimentary to the California-made machinery for working gold ores, and it was the opinion of these officials that it would be adopted to the great benefit of the colony.

In another Australian journal, also of recent date, is an announcement that W. H. Patton of the "Broken Hill" mines has recommended and ordered a complete plant of concentrating machinery from England, for use at these mines.

Here we have the rather curious circumstance of English officials recommending the use of American mining machinery because of its efficiency, and an American mining engineer recommending the purchase of English machinery.

Mr. W. H. Patton is very well known on this coast, first from his connection in mining matters in Sierra county, and then from the prominent position he occupied on the Comstock, Nevada, for so many years. It is not so very long since he resigned the superintendency of a half-dozen or more Comstock mines to go out to the famous Broken Hill mine, Australia. All the reputation he ever gained was made in Nevada, where he has had the credit of designing some of the most elaborate and expensive mining machinery ever built. That a good deal of this credit was really due to others has been pretty well understood here, especially among the foundrymen where the machinery was built. Some of the draughtsmen in little dingy up-stairs offices, some of the mechanical engineers such as Behr, Salkeld and Eckart and some of the superintendents of the foundries, could tell who really designed some of the machinery if they saw fit. But Mr. Patton got the credit always, the general plan of the design naturally swallowing up any matter of details suggested by others.

Why Mr. Patton should now, on his first opportunity, order machinery made in England, instead of in San Francisco, is not easy to understand. England is not noted for her gold or silver mines or gold or silver mining machinery. They have made no specialty of that, and we have. More or less is being shipped from here to the Australian colonies every steamer, and of late the orders are more numerous than ever. It would seem that if the people over in Australia thought enough of Mr. Patton's talent to get him from here, he might have thought enough of the place where he made his reputation to get the machinery needed from here, more especially since in this special class of machinery our foundrymen and designers have had the greatest experience.

**A BIG PAY-ROLL.**—Timothy Hopkins, Treasurer of the Southern Pacific Company, says that the pay-roll of its Sacramento employes this winter is between \$350,000 and \$400,000 a month. Two thousand skilled workmen are now at work in the shops at that place, and they receive from \$3.50 to \$4.50 a day. The present monthly pay-roll for the road west of El Paso and Ogden is about \$1,000,000, and for the past 12 months the company has disbursed about \$12,000,000 in wages.

It appears that the big strike made at Victor, San Bernardino county, Cal., was through the work of the elements. A dispatch says: "An immense washout, making a basin some 500 feet deep, exposed a vein some 30 feet wide and about 100 feet in depth on the ledge, which dips at an angle of about 20 degrees into the mountain. The whole mass assays about \$15 a ton, and a number of smaller veins, from 10 to 30 inches wide, which assay from \$40 to \$60 per ton."

The Supreme Court of New Mexico has rendered a decision holding that a Mexican grant had been floated over \$1,000,000 worth of land which does not belong in it, and that the land is part of the public domain.

BUTTE, M. T., now pays \$8 a cord for its wood.

## The Magnetic Variation at San Francisco.

## Rule for Computing the Variation.

The maximum of the easterly variation of the magnetic needle at San Francisco is very close at hand, and Mr. F. M. Thorn, the superintendent of the U. S. Coast and Geodetic Survey, has authorized Prof. George Davidson to make known such facts relating thereto, gathered during the last few years, as are of interest to engineers and surveyors.

The superintendent's annual report for 1886 contains an exhaustive paper by Assistant Schott upon the secular variation of the magnetic declination. The secular variation of the magnetic declination is the long period which intervenes between two consecutive maxima of the direction of the needle. On the Atlantic Coast the length of this period is probably 250 years. At New York the maximum westerly variation was about 9° in 1680, the minimum was reached about 1795, and the second maximum will progress some years beyond 1900. In 1795 the agonic (or line of no variation) passed parallel to and nearly along the western side of Chesapeake bay, (generally to the N. N. W.) near Washington, Harrisburg, and west of Buffalo and Toronto.

In 1885, this agonic leaves the Atlantic Coast nearly midway between Washington and Charleston, passes Zanesville, Saginaw, etc. On the east side of this agonic line, to and across the Atlantic ocean, the magnetic variation is westerly; on the western side to and across the Pacific ocean the variation is easterly.

On the Pacific Coast there is a narrow belt of the seahoard where the direction of the needle at the present time is stationary; this is the region of the extreme easterly variation.

This narrow belt is well determined from Vancouver to Cape San Lucas. It very closely follows the coast line from the Straits of Fuca to San Diego, and then sweeps around the head of the Gulf of California down the eastern shore to latitude 26° and then southwesterly diagonally across the gulf to the eastern shore of the peninsula of Lower California.

Cape Mendocino and the coast to the northward to latitude 44° are included in this narrow belt. At latitude 39½°, 30 miles northward of Point Arena, it leaves the coast line and sweeps southwesterly, passing over Suisun bay and continuing slightly inland until it strikes the coast again at Santa Monica bay. At the mouth of the Columbia river the maximum limit of the easterly variation has not been reached, but the annual change is quite small. At Port Townsend and over the waters of the Straits of Fuca, Puget Sound and the Gulf of Georgia the maximum has been reached and the variation is decreasing. Through all the country east of the narrow belt of stationary variation the easterly variation is decreasing. Los Angeles is in the belt of no change, with a bare possibility that the maximum limit has been passed.

A tabular statement of the variation in the vicinity of San Francisco brings up the variation from the mean of one hundred and twenty-two Spanish observations reduced to the mean epoch 1783.3; then we have the observations of Vancouver, Kotzebue, Beechey, Erman, Belcher, Ringgold, Davidson and other officers of the Coast Survey. All these observations have been plotted on a curve exhibiting the value of the declination at different epochs, and, as the report says, the observations since 1852 are so consistent that they "look like pearls on a string."

The systematic observation of the magnetic elements was begun on this coast in 1850 by Prof. Davidson, and when in 1870 the series was renewed and it became evident that the epoch of the maximum variation was approaching, a thorough and exhaustive series of observations was commenced. In 1867 and 1869 Davidson's observation showed that the maximum had been passed at Sitka, and in 1870 that at Victoria, B. C., the maximum had been very nearly reached. It reached its extreme range at Port Townsend in 1872.

In 1873 Elmbeck observed the variation along the coast of Lower California. Capt. Nichols of the Navy, on the Coast Survey steamer Hassler, in the year 1881, carried a line of magnetic observations to Cape San Lucas, to the islands off the coast of Lower California and off the Gulf of California and up the Gulf of California. In 1882 he made a similar series

of observations from San Francisco to Alaska. In 1881 Capt. Lawson of the Coast Survey carried a line of magnetic observations from San Francisco through Oregon, Washington and Idaho. In 1882 and 1884 Davidson observed at stations from San Francisco to the City of Mexico, where regular observations are maintained by the Government.

Since 1871, the series at the astronomical station Presidio, commenced in 1852, has been continuous with only one break, and during the approaching maximum the observations will be made during two periods in each year.

The following example shows the reliable character of the instruments used and the methods of observation:

1884, Sept. 5-16: easterly variation..... 16° 32.3  
1885, August 4-18: " " " " " " 16 33.4  
1886, April 21-24: " " " " " " 16 33.1  
1887, Nov. 15-19: " " " " " " 16 33.9

The observers were Davidson, Marr and Morse. Each result is the mean of from four to ten daily determinations from the maximum and minimum of each day.

A continued series of observations at any given station demonstrates that the hourly variation during the day amounts to as much as ten minutes of arc; and that there are days when "magnetic disturbances" occur, giving a mean daily range of four or five minutes of arc on either side from the average. It is therefore evident that when an hourly change of ten minutes occurs during the day, the difference at the end of a line one mile long will amount to 15 feet if measured at the maximum and minimum readings of the needle.

The value of the Presidio series of observations for the determination of the epoch of the maximum variation, lies in the fact that they have been made at one station, and that no disturbing influences such as buildings with masses of iron have affected the measures; moreover, the astronomical hearings to the point of reference have been definitely observed.

The practical value of the whole series of observations given is readily appreciated by those who have been called upon to decide the hearings of boundaries of land wherein the compass bearing is given, but no record is exhibited to demonstrate the variation of the needle at the specified time. The table herewith presented has a worth beyond the dates of the tabulated observations, because from their discussion it is practical to derive a formula by which the variation at any proposed date can be safely computed.

From the Superintendent's annual report we reproduce the table of observed and computed magnetic variations at San Francisco.

TABLE OF THE COMPARISON OF THE OBSERVED AND THE COMPUTED MAGNETIC DECLINATION AT SAN FRANCISCO FROM 1783 TO THE PRESENT TIME.

DATE.	Observed Magnetic Variation.	Computed Magnetic Variation.	Diffs. (O-C)
1783.3	E. 12° 54' 6"	E. 12° 48' 0"	-06' 6"
1792.9	12 48.0	13 13.8	+25.8
1818.7	15 00.0	14 28.2	-31.8
1837.5	15 27.0	14 53.4	-33.6
1859.9	14 55.2	14 59.4	+04.2
1830.5	14 51.0	15 01.2	+10.2
1837.5	15 10.2	15 18.6	+08.4
1839.5	15 19.8	15 24.0	+04.2
1841.9	15 30.0	15 30.0	00.0
1850.0	15 40.8	15 48.0	+07.2
1852.3	15 28.8	15 52.2	+23.4
1858.4	15 52.8	16 03.6	+10.8
1860.6	16 25.2	16 16.2	-09.0
1871.9	16 22.8	16 23.4	+00.6
1872.8	16 25.8	16 24.0	-01.8
1873.7	16 24.6	16 25.0	+00.6
1874.0	16 27.0	16 25.8	-01.2
1879.2	16 31.2	16 30.0	-01.2
1880.8	16 33.6	16 31.2	-02.4
1881.5	16 28.8	16 31.8	+03.0
1883.4	16 38.4	16 32.4	-06.0
1884.7	16 32.4	16 33.6	+01.2
1885.6	16 33.6	16 33.6	00.0
1886.3	16 33.0	16 34.2	+01.2
1887.9	16 34.2	16 34.8	+00.6

This table shows what the observed magnetic variation was at the given date, and the computed declination shows what was the most probably true declination at the same date under normal conditions. As the observations themselves are subject to many known and unknown sources of error, the computed measures should be adopted. If the date required is not given in the table, the variation can be computed by the formula which Mr. Schott has derived from the discussion.

For San Francisco this formula is:  
 $D = -12.94 + 2.65 \sin (1.05m - 135^\circ.5)$ ,  
 where  $D$  is the easterly magnetic variation, and is reckoned with a minus sign;  $m$  stands for  $(t - 1850.0)$ , or the difference in time expressed in years and fractions of a year for any time, " $t$ ," and the middle of the century, within the range of observations at any station.

If, for example, it be required to know the magnetic variation at San Francisco for the end of June, 1867, it will be found 16° 18' easterly.

For computing the magnetic variation at 26 other places on this coast, along the coast of Alaska, on the Mexican Coast, and at the cities of Mexico, Vera Cruz, rules of similar form are given in a special table.

Upon the Pacific Coast the magnetic variations of the old Spanish navigators are wanting in their narratives up to the period of Bodega and his confreres, 1774-1779. Cahrillo, Ferrel and Vizcaino never refer to it, and yet they must have observed it. Although Drake was more than five weeks in Drake's bay, the narrative of Parson Fletcher never refers to it. An observation at that date would have been of inestimable value.

In the Arca del Mare, 1647, the variation is given on two charts, all the way from Aqua Pulca (Acapulco) to Cape Mendocino, but the positions are very doubtful.

The earliest record of apparently trustworthy magnetic variation is found in an "Historical Journal to the North of California in 1768, 1769, 1770, published by Dalrymple in 1790." This volume, which is in the possession of Robert A. Thompson, U. S. Appraiser, contains the journal of M. Sauvage le Muet, officer in the ship Comtesse de Pontchartrain, 1714, wherein he describes his landfalls, etc., from the Island of Guadalupe off the coast of Lower California to the Bay of Bandera in latitude 20° 40' just north of Cape Corrientes on the Mexican coast. In this brief journal Prof. Davidson has found that nine determinations of the magnetic variation are given at as many places whose geographical positions he has deduced from the modern charts.

These observations are quite systematic and indicate a good observer. At Bandera bay the fact is especially noted, "no variation." This fixes the agonic line at the place in 1714, and Mr. Schott reports that it is a very interesting record so fortunately recovered.

Curiously enough, we are not enabled to join by an easy sweep the two agonic of the Atlantic and Pacific Coasts of that period. The agonic of 1700 on the Atlantic side crossed the coast line in a nearly east and west direction through the northeastern part of North Carolina. This shows the independence of the Pacific agonic line then as now.

The importance of the Pacific agonic of 1714 upon the length of the magnetic period is self-evident. As an incidental fact it shows that the change of the variation has been nine degrees to the present time.

Within the last month Prof. Davidson has had several applications from engineers and surveyors for the value of the variation at given epochs, when old surveys were made.

**Mining Debris Bill.**

Following is the full text of the bill introduced in the House of Representatives by Congressman Biggs, for the investigation of the mining debris question in this State:

Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled, That the Secretary of War is hereby authorized and directed to detail three officers from the Engineer Corps of the United States Army as a Commission, for the purpose of making a thorough examination and investigation of the mining debris question in the State of California, and for a complete examination and survey of the injured river channels, its tributaries, and the land adjacent thereto, with a view to their improvement, and to devise some plan whereby the conflict between the farming and mining section may be adjusted. And that the sum of \$10,000, or so much thereof as may be necessary, is hereby appropriated out of any money in the Treasury not otherwise appropriated, for the purpose of carrying into effect the provisions of this Act; the said sum to be expended at discretion of the Secretary of War; the said Commission to report as early as practicable to the Secretary of War the result of their investigation.

**SURVEYING WORK.**—Colonel Fred Crocker says the Southern Pacific has had, until within a few weeks, over 40 different parties of surveyors at work in various sections of the State, and that they now have maps, profiles and located lines in every district where there is the slightest prospect for a railroad line.

The first oil steamer with iron tanks to convey the product of the Ventura oil wells in bulk was launched this week from Alexander Hays' shipyard.

The Lower California Copper District.

Among the prominent copper mines of this coast are those on the property purchased by a French syndicate in Lower California. A description of these mines was furnished by D. W. Brunton to A. F. Wendt for his paper on the "Copper Ores of the Southwest." The location of these mines is in the municipality of Moleje, in Lower California, Mexico, and across the Gulf of California, 90 miles distant from Guaymas.

Copper was first discovered in the district in the spring of 1863 by Jose Rosa Billaviconico, a fruit-packer, who was looking for a short trail from Santa Agueda ranch to Santa Maria port. The mines were first opened in 1871. They cover a territory some six or seven miles in length along the coast, and extending parallel therewith and into the peninsula, a distance of three or four miles. The entire strip of country may be considered an elevated plain rising toward the interior. The plain is cut by numerous canyons and ravines, which empty into the gulf. The ore occurs in three beds with intervening rock, and the ore beds and the whole country dip at a slight angle toward the shore of the gulf. The two accompanying sections are self-explanatory. The heavy, black lines in the long section indicate beds of copper ore.

The rock in which the ore is found is evidently of very recent origin, and overlies an undulating bed of trachyte of unknown depth. While the ore beds extend over a very large territory, the valuable portions cover a comparatively limited area, and the pay ore occurs in chutes or chimneys in the beds, having a width of 75 to 150 feet, and a general northwest and southeast course. The ores differ very widely in composition and appearance; in fact, a great many of the ores have not the characteristic appearance of ore at all, but look like yellow clay. True copper ores varying from copper glance to green and blue carbonates, do, however, occur. Malachite forms the bulk of the ore; and wad or superiferous oxide of manganese occurs in the next largest quantity. All the work done on these mines has been by shallow shafts or adits from the surface. The thickness of the ore beds varies considerably, from a mere seam to three feet.

Yaqui Indians are almost exclusively employed; and until the transfer of the property to the French syndicate, all the ore was mined, sorted up to about 20 per cent, and shipped to Europe. Since the property changed hands a 42-inch water-jacket furnace has been erected and run on the ores of the property; and at present 20 miles of narrow-gauge railway has been built, and three large square water-jacket furnaces, of the Raschette type, and measuring 42x90 inches at the tuyeres, have been erected. The cost of smelting, with English coke laid down on the shore of the gulf at less than one-half of its cost to any other smelting works in the Southwest, and the cost of mining labor, with miners at only \$1 per day, being so extremely low, a large output is expected from these mines for some time.

Hyperbole in Mining Reports.

It is astonishing the extent to which the human judgment is apt to be warped by either interest or prejudice. The bias imparted to our thoughts and feelings by sheer prejudice finds apt illustration in the politics of this, and perhaps of every country, these being everywhere largely the result of early impressions and education. In like manner self-interest determines to a great extent the opinions entertained by men in regard to the ordinary affairs of life. Seen through this medium, the mental vision suffers the strangest obliquity.

We have been led to this train of reflection from observing how much newspaper writers in the mineral regions seem sometimes influenced when commenting on the merits of experts sent to examine and report on mining properties in their neighborhood by the character of such reports. If these reports be favorable, the local press sees much in the mine-viewer to approve and praise. He is spoken of as the "well-known expert," the "distinguished professor," the "celebrated mining engineer," etc., just as the metropolitan press is wont to beslobber with undue praise the notable prize-fighter, horse-jockey, or man who performs some great feat at base-ball or billiards.

But let the mine-inspector's report be unfavorable; let him presume to condemn the property he has been sent to examine, or speak lightly of the district generally, and very different is the treatment he receives at the hand of the local scribe, who is then pleased to doubt the man's fitness for a service of this kind. He has heard damaging rumors about him—things not at all to his credit—the fellow, so far as can be learned, having altogether an unenviable record. Paraphrasing somewhat the language of the mountain editor on such occasion, it may run slightly like this: "Expert! forsooth! What can this person know about mines? We gravely doubt his ever having seen one before; he may have seen the inside of a penal institution, but of a mine never until now. We wager he comes here in the interest of some wily capitalist, who, through this mendacious report, hopes to give our mines a black eye, and so get hold of them for a song! Was ever baser scheme concocted than this? But it shall not avail these mercenary parties, neither principal nor hireling. If they hope to depreciate the value of the 'Lunar Rainbow' or other of our sterling properties by such shallow device, disappointment awaits them. The honest, intelligent denizens of 'Wild Goose Flat' will see to it that such flagrant attempt at robbery react on their own heads. Far be it from us to incite to violence or indulge in unseemly language; but we strongly advise, should another of these unmitigated frauds and immeasurable liars be found prowling about 'Wild Goose' that he be incontinently jerked and rode on a rail. This is an orderly and law-abiding community, but we can see no good reason why a knave like this, coming here to report adversely on our mines, should not be treated to a coat of tar and feathers. In most camps the miscreant would be strung up to a tree, and a period put to his worthless existence.

"The *Miners' Protector and Clarion of Freedom* is a conservative journal, slow to resent wrong and temperate of speech; and ours, as above remarked, is a peace-loving and patient community. They shrink from the very thought of bloodshed, and even regard the slightest infraction of the law with abhorrence. Still, it seems to us, in view of what has lately transpired, that a shot-gun brigade should at once be organized for the purpose of protecting the mining interests of 'Wild Goose' against this new danger."

That our mountain contemporaries and their constituents have sometimes had good reason to complain of the reports made by these mining experts is undoubtedly true, but it should be remembered that the injury thence arising has been measurably repaired by the oft-time too laudatory reports emanating from this same class of professionals, a consideration that ought to mollify their resentment toward the offenders. That these reports should err in neither direction is, of course, desirable, since gross exaggeration can in the end be only hurtful to all concerned.

DURING the past week 340½ tons of Chollar ore were milled which averaged \$38.48 per ton.

The next industrial exhibition of the Mechanics' Institute will open August 7, 1888, and close September 15, 1888.

## MECHANICAL PROGRESS.

## Rails One-Quarter of a Mile in Length.

The rapid progress which is being made in the practical application of electricity is one of the marvels even of this progressive age. We made mention in these columns a few weeks ago of the successful application of electricity to the welding of iron. We have now to notice the application of this invention to welding railway iron, *in situ*. By this device a large number of rails are joined together as they are placed upon the track so as to make a continuous rail of any desirable length, thereby avoiding the pounding always incident at the end junction of the rails as ordinarily laid, a matter greatly to the discomfort of the passengers, and one which causes much wear and damage to the rolling-stock.

The inventor is Mr. Elias E. Ries, a well-known Baltimore electrician, and consists of appliances by which this work may be conveniently and rapidly performed. By this device the ends of the rails are welded by means of a transformed electric current of large volume of heating capacity, and afterward tempered so as to bring the joint to correspond in hardness to the remaining portion of the rails. The entire welding apparatus is contained on the pilot or construction car, and the time occupied in forming a joint is estimated to be less than half a minute. The expansion joints are placed at intervals of one-fourth of a mile, the rails being securely fastened at their center and expanding in both directions, so that the variations produced in a length of one-eighth of a mile only require to be compensated for. On a double-track street or steam railway having 30-foot rails, there are 704 joints to the mile, each of which gives quite a perceptible shock every time it is traversed by the wheel. With the expansion joints these shocks are said to be obviated, and counting four to the mile of single rail, 688 joints out of the 704 are dispensed with. The importance of this invention in the matter of welding rails alone can be readily understood, if practice bears out the results that are promised by it.

**HEAVIER RAILS AND LOCOMOTIVES.—**ENGLISH VS. AMERICAN.—The Pennsylvania Railroad Company is about to institute a series of crucial experiments for comparing the heavy English rail with the lighter American. In the experiments, wherever the English rails are put down, the roadbed will also be made to correspond to the English system. The experiments will be made by laying half-mile sections alternately with the different rails over two miles extent of road. On the New York division the rails will be laid between Menlo Park and Metuchen; on the Philadelphia division, between Lemon Place and Kintzer's; on the Middle division, one mile east of Huntingdon, and on the Pittsburg division the rails will be put down on the eastern slope of the Alleghenies, near Alleghippas. The new rail will weigh 90 pounds to the yard, and they are to be tested for ten years. The company has also ordered an English engine of the usual type for comparison with the American locomotive. The days of light railroading are evidently fast going out. On many of the new lines, heavy rails, heavy engines, heavy cars, heavy coaches and heavy trains are already the order. The old roads are making their renewals with heavier materials of all kinds. Freight trains of ten years ago would be as pigmies by comparison with those of to-day.

**WORKING METALS BY ELECTRIC POWER.**—The Dresdoer bank is stated to have acquired the right of working the German patents for the invention of MM. N. de Benardos and St. Olszewski of St. Petersburg, while the firm of Rothschild of Paris has acquired the exclusive right of working the patents for France, Belgium, Spain, Italy and Austria. The invention referred to relates to a method of working metals by the direct application of an electric current, and more especially of forming alloys by the same means. The results obtained are stated to be most remarkable, it being an easy thing to intimately commingle all manner of metals, even those least fusible, without the admixture of any substance save solder, and to effect this not only between homogeneous, but also heterogeneous metals, alloying, e. g., copper with both wrought and cast iron, nickel with iron, lead with iron, aluminium with platinum, etc. Among professional metallurgists we are told that much importance is attached to this invention, and the preliminary trials that have taken place at St. Petersburg and at Creil, near Paris, having turned out most successful, several French and Russian metallurgists are stated to have applied for licenses to work the system on a commercial scale.

**A NEW PROCESS** for producing iron and steel direct from the ore has been invented and patented by a Russian engineer, which, a British consular report says, will create a revolution in the manufacture of charcoal iron. Under the new process iron ore, after being submitted to the ordinary smelting process, is taken direct from the furnace to the rolling-mill and turned into thin sheets of the finest charcoal iron.

**IRON AND STEEL FOR WOOD.**—It appears that special attention is being paid in France and England to a more general substitution of iron and steel for wood, wherever practicable, in manufactured articles, as, for instance, building materials, boxes and packing-cases, barrels or casks, carriages, carts and other vehicles, furniture, fencing, railway-work, sheds, signal-boxes, telegraph poles, etc. In France there have recently come into use hollow iron-window frames and doors, which are said to be light and strong and of far greater durability than could ever be assumed of wood. There is no reason, too, it is thought, why corrugated barrels of iron and steel should not be used for liquors, since milk and preserved fruit and other articles are kept in cans. Steel is finding much favor among carriage-builders, but there is still much prejudice against the metal being used in the manufacture of furniture. The general adoption of steel sleepers is warmly advocated by some, as is also the employment of iron and steel in the construction of railway cars, and the erection of wooden sheds, signal-boxes, etc., by railway companies, as at present, might, it is urged, be profitably and economically substituted with steel. Corrugated sheet-iron casks are already being used in Germany to transport liquids which expand by heat. They stand an internal pressure of 30 pounds to the square inch, and are a great saving.

**THE SWINERTON LOCOMOTIVE.**—A locomotive possessing several unusual features has been recently built by the Hinkley Locomotive Company of Boston, for the Swinerton Locomotive Driving Wheel Company. The engine is designed to run fast passenger trains, and has a single pair of drivers, 67 inches diameter on tread, and a pair of 42-inch trailing wheels with radial motion. The front end of the engine is carried on a four-wheel truck, as usual. The engine has piston valves, but the most novel feature is the form of the tread of the driving wheels. The circumference of the tire, instead of being a true circle, is polygonal, and formed of 105 flats, each about two inches long. The object is to prevent slipping. The engine has not yet been tried, but it is claimed that polygonal tires have been running on a four-coupled engine on the Boston & Lowell road during the last year with satisfactory results. A flat wheel is generally regarded as damaging to the rails, while the motion of an engine or car with flat wheels is exceedingly unpleasant. Whether any extra adhesion will be gained seems doubtful, but even this means of preventing slipping would certainly, according to all preconceived notions, be more objectionable than the use of sand.

**IMPROVEMENT IN THE MANUFACTURE OF TIN CANS.**—An ingenious and useful improvement in the manufacture of tin cans for preserving food is being introduced, the plan consisting simply in so forming the lid that it is merely pressed on, and the can is hermetically sealed so that no internal pressure can remove the lid. Water boiled in a tin thus closed has failed to force it off, although the steam pressure has burst the can itself. A penny piece, however, used as a lever by being placed under a rim formed around the top of the cover, with the shoulder of the can as a fulcrum, raises the lid with a remarkably small expenditure of power. The principle involved in the device is that of the wedge and lever. The neck of the tin on which the lid fits is formed at a very slight angle from the vertical, and the rim of the lid is made at a corresponding angle, no colder being used to form the joint. By means of this arrangement, therefore, the opening of cans is rendered a remarkably clean, quick and simple operation, contrasting greatly in these respects with the inconvenient method of opening now in vogue.

**PRICE OF IRON IN 1773.**—In 1773 Baltimore people were served with the *Maryland Journal and Baltimore Advertiser*, a folio issue, 12 by 14 inches. Beside an advertisement from George Washington, reciting that he had patents for 20,000 acres of land on the Ohio and Great Kanawha, it contains a market report of August 22d of the year named, from which it is learned that flour sold for from \$5 to \$5.25 per barrel, bar iron for \$130 per ton, and pig iron for \$40 a ton.

**HOT WATER AND LEAD.**—Lead in contact with steam, under a pressure of 10 pounds per square inch, very soon loses its strength, and it is therefore good neither for packing joints nor for conveying steam. When thus used for the latter purpose, the lead, if not kept on a continuous support, will lengthen and sag, until from thinness it entirely gives way and bursts.

**A CHEAP STEAM PUMP.**—A complete steam pump for \$7 is now offered and meeting with successful sale by Messrs. Van Duzen & Tift of Cincinnati. This is a surprising innovation in the line of trade in the matter of cost. Send to them for catalogue for prices of the various sizes and designs.

**IRON ARTICLES,** when forged, can be case-hardened by heating to bright red and sifting on the surface finely powdered praseite of potash. When cooled to a dull red, plunge into cold water.

**HARDENING CAST IRON.**—Cast iron may be hardened by heating to a bright red and simmering in pure lard oil.

## SCIENTIFIC PROGRESS.

## What Science Owes to Industry.

Far be it from me to depreciate the value of the gifts of science to practical life, or to cast a doubt upon the propriety of the course of action of those who follow science in the hope of finding wealth alongside truth, or even wealth alone, writes Prof. Huxley in *Popular Science Monthly*. Such a profession is as respectable as any other. And quite as little do I desire to ignore the fact that, if industry owes a heavy debt to science, it has largely repaid the loan by the important aid which it has, in its turn, rendered to the advancement of science. In considering the causes which hindered the progress of physical knowledge in the schools of Athens and of Alexandria, it has often struck me that where the Greeks did wonders was in just those branches of science, such as geometry, astronomy, and anatomy, which are susceptible of very considerable development without any, or any but the simplest, appliances. It is a curious speculation to think what would have become of modern physical science if glass and alcohol had not been easily obtainable, and if the gradual perfection of mechanical skill for industrial ends had not enabled investigators to obtain, at comparatively little cost, microscopes, telescopes, and all the exquisitely delicate apparatus for determining weight and measure, and for estimating the lapse of time with exactness, which they now command.

If science has rendered the colossal development of modern industry possible, beyond a doubt industry has done no less for modern physics and chemistry, and for a great deal of modern biology. And as the captains of industry have, at last, begun to be aware that the condition of success in that warfare, under the forms of peace, which is known as industrial competition, lies in the discipline of the troops and the use of arms of precision, just as much as it does in the warfare which is called war, their demand for that discipline, which is technical education, is reacting upon science in a manner which will, assuredly, stimulate its future growth to an incalculable extent. It has become obvious that the interests of science and of industry are identical; that science cannot make a step forward without, sooner or later, opening up new channels for industry; and, on the other hand, that every advance of industry facilitates those experimental investigations upon which the growth of science depends.

**THE GREAT TIDAL WAVE.**—The tidal wave, says Dana, differs from ordinary waves in many respects: In having an extra terrestrial origin—the attraction of the moon and sun—owing to which the ocean feels the impulse to its bottom, and the wave is a translation wave; in the movement being westward, in consequence of the earth's eastward revolution, and hence in having the same rate of movement as the earth, or 1000 miles an hour at the equator (that is, movement in wave motion, not in water), consequently in having for the length of a single wave 12,000 miles, the ebb and flow occupying together 12 hours. The Pacific is too narrow from east to west to contain at once much over half of the wave-curve, and the North Atlantic could hold transversely but a quarter of it. After leaving the Pacific its course is north-westerly in the Indian ocean, and the same also in the Atlantic. The height in the Middle Atlantic is very small, but as the depth diminishes on soundings the wave increases in elevation, and its translation character becomes more and more appreciable. Still, at the prominent headlands of the continent, its height is only one to two feet. Converging coast lines augment the tide's height, so that it becomes 5 feet at the entrance to New York bay, 7 feet at Savannah, 10 feet at Boston, and 40 to 70 feet in the narrow Bay of Fundy.

**A UNIQUE LAKE.**—In a little basin of the Alps, 7700 feet above the sea level and five miles from the end of the great Aletsch glacier, is the unique little lake known as the Marjalén sea. This is fed by mountain streamlets, its waters being held back by the ice of the great glacier itself. An English geologist mentions having seen it in 1853 as a body of water 300 yards wide and three times as long, with a maximum depth of 97 feet. But the next day it had vanished. The ice-dam had yielded efficiently to allow the pent-up water to escape beneath the glacier and plunge into the valley below, devastating the fields and considerably raising the level of the Rhone. These discharges take place at irregular intervals, though reputed to occur every seven years. The latest outbreak was in September last, since which it has been proposed to lessen future damages by providing an artificial outlet to reduce the lake's capacity one-half.

**COMPRESSIBILITY.**—At a recent meeting of the Edinburgh Royal Society, Prof. Tait communicated some results on the compressibility of water, of mercury and of glass. The average compressibility of a 20-per-cent aqueous solution of common salt per atmosphere for the first 100 atmospheres is 0.00000316. It diminishes rapidly with the percentage of salt in solution. The compressibility of common lead glass is 0.0000027 at a temperature of 19 degrees C.

## American Chemical Industry.

The *Engineering and Mining Journal* has published a series of articles on the above subject which is worthy of attentive consideration, and to which we propose to refer from time to time in these columns. In a general notice under this head the editor of the *Journal* recently said: For very nearly a century it has been customary in civilized countries to consider the production of alkali in the light of a criterion of national advancement; nor is this a matter for surprise when we remember that in all such important manufactures as soap, glass, candles, paper, sugar, starch, wood-pulp, pottery and earthen-ware, as well as in bleaching, dyeing, and oil-refining, the use of the compounds of soda, chlorine and lime are essential and primary factors. It is extremely melancholy to reflect that more than one-tenth of our requirements are furnished from home produce and that we have consequently no chemical industry; and to admit that if Dr. Wyatt's work were limited to a simple record of our own progress, a very few lines would suffice to tell the tale.

Now without entering into any one of those technicalities involved in this question, we may aptly point out that all the elements required in this industry are obtained from natural sources; that they comprise sulphur, coal, salt, limestone and nitrate of soda, and that without exception we possess the whole of them in absolute abundance. We, therefore, decline to believe in the necessity for paying some ten millions of dollars to England every year for what we ought to be making ourselves; and we attach no importance to various hackneyed and puerile excuses of dear land, dearth of material, scant capital and costly labor, which have hitherto been advanced in extenuation of our shortcoming and which probably only serve to cover the interest of a clique. The real root of the evil is undoubtedly a sheer and utter ignorance of the industry and all that pertains to its proper conduct; at this root we intend to strike, and we trust that in our efforts to destroy it we may receive cordial co-operation from all those who, like ourselves, are devoted to the progress of the United States in all the diversified elements of a stable industrial prosperity.

**A GREAT MAGNET.**—It is said that one of our leading army engineers has brought before the engineering classes of late an experiment of so startling a nature in its inception as to promise wonderful results. It is a monster magnet made of two Rodman guns, which are connected at the breech. Around the magnet thus formed is wound about 20 miles of submarine cable. The cable is some that has been used in the torpedo service. It is wound and fastened in a substantial manner, making a permanent magnet. When electricity is applied some strange results take place. For instance, a bar of railroad iron 30 feet long, if placed in the open cannon's mouth, cannot be drawn out by as many men as can grasp it. Another instance of the strength of this big magnet was illustrated recently with a 350-pound cannon-ball. The shot was placed in the mouth of the cannon on the negative side. On reversing the electrical current it fell from its position, but was attracted to the opposite cannon and clung to its side. The positive current was then reversed alternately with the negative, and the heavy cannon-ball played between the two cannon like a tack between the poles of a toy magnet. It is said that there will soon be a public exhibition of this remarkable magnet.

**DYNAMITE SHELLS.**—The projecting of dynamite shells by gunpowder instead of by compressed air, which seems to have been successfully accomplished, marks what bids fair to become an important era in the progress of such things. First Lieutenant Zalinski determines that such shells can be projected by air if great care is observed. Next Lieutenant Grayson has shown that such shells may be safely projected by gunpowder. This latter fact looks to most important possibilities in the future conduct of wars, and furnishes another strong reason to believe that the destructive weapons of modern warfare may soon be such as to render war but little else than wholesale massacres, from which no glory nor honor can be derived. When that time fully comes the occupation of great strategic generals will be gone, and there will be little opposition to a continental or world's congress in which all national disputes will be settled without recourse to arms.

**ELECTRICAL TRANSMISSION.**—Experiments have proven that elevation of the wires from the earth have much to do with the speed at which the electric current is transmitted. At a moderate height Prof. Gould has found that the wires transmit at the rate of 12,000 miles a second, but if the wires are suspended at a much greater height the rate is increased to 16,000 or over 24,000 miles a second. Subterranean wires and submarine cables transmit slowly.

**VIOLET AND INVISIBLE RAYS FOR FLOWERS.** Prof. Sachs, the great German botanist, has discovered that the ultra violet and invisible rays of the solar spectrum especially promote the development of flowers, the growth of which is exceedingly feeble when the rays are suppressed, although that of the other parts of the plant is very luxuriant.

## ENGINEERING NOTES.

## Steam vs. Sand for Increasing the Adhesion of Locomotives.

One of the questions submitted to railroad companies by the International Commission of the Congress of Railroads was as to the question of the use of a jet of water or steam to increase the adhesion of locomotive wheels. The companies have submitted answers to this question, which are published in the *Bulletin* of the commission. These answers have shown a decided decrease in expense, the expenditure for sand having been in one instance \$4000, while the cost of the subsequent use of steam or water jet for the same length of time was only \$500.

The further opinion is advanced that, while the adhesion is not increased quite so much by the use of water as of sand, the water-jet system has the advantage in that it does not interpose any resistance to the movement of the train, as does the sand, more or less of which remains on the rails. The engine-drivers much prefer the water-jet system, as they say it makes the train lighter—that is, it draws more easily. It is stated also that the abandonment of the use of sand is accompanied by a lessening of the wear of rails. This result is supported by numerous observations made upon different railroads. The report concludes that the results so far obtained justify the making of more extended experiments with the water-jet system.

**THE PRINCE EDWARD ISLAND SUB RAILWAY.**—The English company, at present building the London and Southwark subway, has submitted a tender to the Dominion Government to complete the subway under the Northumberland strait, dividing Prince Edward island from the mainland. The proposition is to take the Prince Edward Island railway off the hands of the Government and operate it; also to subsidize it \$200,000 per year for 50 years. Walter Stanley, C. E., has already favorably expressed his opinion as to the feasibility of the scheme of traveling under the strait. The Government holds that a great advantage will be obtained from this new scheme, in making a direct line to the seaboard by running trains over the Short Line railway through Main, and utilizing the subway and the Prince Edward Island railroad to Georgetown, thereby making a saving of 372 miles of water passage, and 24 hours of time in a passage from Montreal to Liverpool.

**THE NEW BALTIC CANAL.**—By means of a new canal, water communication between the Caspian and the Baltic has been greatly improved. This canal joins the rivers Wyegra and Kovja, and forms a fresh link in the chain of water-ways known as the Maryinsky system, connecting the Neva with the Volga. Some of the cuttings through which it runs had to be excavated to the depth of 30 feet; and most of the work was done by hand, upward of 20,000 laborers having been employed in carrying through the undertaking, together with several of the most effective dredging machines. Compared with the rest of the vast canal system between the Neva and the Volga, the new link, though not so formidable or extensive as some others, derives its importance from its relieving the pressure of traffic on the other canals and shortening the distance between Kybinsk and St. Petersburg.

**COMPRESSED AIR INSTEAD OF STEAM.**—Considerable attention is being given to the introduction of compressed air instead of steam as a motive-power both in this country and in Europe. A company in Birmingham, England, are completing a large central plant for furnishing compressed air through mains to the owners of small engines. Trials already made are said to have shown that the cost to consumers will be considerably less than the cost of steam made on the premises. Besides doing away with the dirt and dust from the coal, and the saving of room, the use of compressed air is said to furnish excellent means of ventilation. A valuable feature of the charter of this company is a clause compelling them to divide all profits over 10 per cent with the consumers.

**ELECTRIC RAILWAYS.**—It will surprise many to learn that there are now running in this country 11 electric railways, equipped with 68 motors and motor cars. It is estimated that they are now carrying at the rate of 3½ million passengers a year, and when the roads now under contract are completed, twice that number will be carried. It is undoubtedly a fact that considerable progress is being made in this country in the use of electric motors, both for tramways and for furnishing small power in factories. There has been a superabundance of smoke about the matter of making and introducing electric motors and engines, and we are glad that there has been some fire.

**THE NICARAGUA CANAL.**—Engineer Menocal of the Nicaragua Canal Company is making arrangements to send out eight engineering parties to locate the canal. He expects the work of excavation will begin not later than July 1st. A syndicate of New York, Baltimore and Richmond gentlemen have the matter in charge. The total cost is estimated at \$65,000,000.

## USEFUL INFORMATION.

## The Temple at Jerusalem.

The great glory of Jerusalem was the Temple, a monument rather of wealth than of artistic skill. Like all Solomon's buildings, it was designed by a Phœnician architect; and the skilled workmen who carved the wood and stone, and wrought the gold, and founded the brass, were citizens of Tyre and Sidon, only the rough labor being provided by the hundred and fifty-three thousand Canaanite settlers who were drafted off to the forests of Lebanon to hew timber, and to the port of Joppa to carry the materials from the seaboard to Jerusalem.

Of the architecture of the Temple we know little except its proportions, and that, like most temples of antiquity, it was divided into three courts, called, in this case, the porch, the holy place, and the holy of holies. It was extremely small, measuring only 35 feet in width, while the total length was only 105 feet; so that its impressiveness depended on its golden walls and pillars, floor and ceiling, its precious jewels, and the richness of the embroidered hangings that curtained off the sanctuary. And mingled with all this gold we read of brass, a compound that seems to have been scarcely less esteemed in those days, when the tin mines of Spain and Cornwall were among the recent discoveries of the Phœnicians, and the brass made at Tyre from the tin of Tarshish or Spain, and the copper from Cyprus was still a rare article, commanding a very high price.

The cost of this golden Temple was defrayed by the moneys left by David and by the offerings of the people; but heavy taxes were levied to create funds for the palaces, towns, and fortresses that arose in such ruinously rapid succession. No exchequer could long endure such a drain, no nation support so vast and sumptuous a court without murmuring; and though we do not know what was the relative value of gold and of the commodities of life, the stress laid upon the fact that all the vessels in the palaces were of gold, points to the conclusion that this provision was as sumptuous in those days as it would be in our own.

## How to Prepare Calcimine.

Soak one pound of white glue over night; then dissolve it in boiling water and add 20 pounds of Paris white, diluting with water until the mixture is of the consistency of rich milk. To this any tint can be given that is desired.

**Lilac.**—Add to the calcimine two parts of Prussian blue and one of vermilion, stirring thoroughly, and taking care to avoid too high a color.

**Gray.**—Raw umber, with a trifling amount of lampblack.

**Rose.**—Three parts of vermilion and one of red lead, added in very small quantities, until a delicate shade is produced.

**Lavender.**—Make a light blue and tint it slightly with vermilion.

**Straw.**—Chrome yellow, with a touch of Spanish brown.

**Buff.**—Two parts spruce, or Indian yellow, and one part burnt sienna.

## WHY SNOW DESTROYS MARBLE STATUARY.

—The results of the examination of snow taken from different places in Munich and its neighborhood by Mr. Sendtner, says the *Pharmaceutical Journal* (London), would seem to indicate not only that snow has a considerable faculty for absorbing sulphurous acid from the atmosphere, but that the absorption goes on continuously for some time. Mr. Sendtner ascertained that, on one day, when snow fell, sulphurous and sulphuric acids were present in it in fairly equal proportions, but on the second day, almost all the sulphurous acid had been oxidized to sulphuric acid. In the vicinity of chimneys and gas works the absorption would, of course, be greater. This great absorption power toward sulphurous and sulphuric acids is considered of great practical interest as explaining the destructive influence of snow upon marble statuary.

**COAL AND IRON** are generally found in close proximity; but it is seldom, if ever, we have noticed so close a juxtaposition as is stated in the following item from a Southern paper: "A person can stand on the postoffice roof in Birmingham, Ala., and shoot a pistol bullet into a mountain of coal on one side and a mountain of iron on the other. The limestone required to flux the iron lies in the narrow valley beneath."

**RESIN** is frequently used for producing an immediate adhesion of the belt to the pulley, and for this it is well suited, but if the owner has any regard for the consequences he will soon learn that while the resin will give an instant grip to the slipping belt, it will soon he ground into the leather, stiffen the material and make the last state of that belt worse than its first.

**WARM WATER FOR CATTLE.**—The *Silver State* says it has been proved by actual experiment that cattle can be fattened at Golconda, where they have water at a temperature of 75° to drink in winter, in one-half the time and with less feed than where they have to drink ice-water.

**COAL OIL VS. WHALE OIL.**—Whales were destroyed to such an extent before coal oil was

discovered that they seemed destined to be utterly destroyed in all of the seas and waters on the globe where they were found. They were captured for whalebombs as well as oil. Cheap coal oil has caused a great increase in the whales in all of the old whaling-grounds. Coal oil has run whale oil out of the market.

**A DOG'S SCENT.**—An investigator has discovered that, although dogs can follow a man's trail even after strong perfumes have been sprinkled along the track, yet if sheets of tissue paper are placed on the ground to be walked over and afterward removed, no trace of the scent will lie.

**STEALING ELECTRICITY FROM THE TELEPHONE.**—A jeweler at Lowell, Mass., has demonstrated his originality by stealing electricity from his telephone and using it to run light machinery.

**GUNPOWDER** and cannon were first used in warfare at the siege of Constantinople in 1453.

**A SNAIL'S PACE** is a mile in 14 days.

## GOOD HEALTH.

## A Scientific Cataract.

The blindness of the old-school medical profession to modern progress is due to what may be called a cataract formed by medical bigotry. It will require half a century to remove this cataract. We are reminded of its existence by a paragraph in the *Boston Herald* speaking of the cancer in the throat of the Crown Prince of Germany, which the faculty expect to prove fatal, which it calls "a physical disorder for which medical science has yet to discover a remedy. It is not at all likely that this fortunate discovery will occur soon enough to be of service to the heir-apparent." This flat denial of the curability of cancer is in the same columns in which an enlightened correspondent gave ample proof of cures with names and dates. Such denials are published in a city where a diligent inquiry would reveal large numbers of successful and well-attested cures of cancer. But, alas! says an exchange, these cures were not made under the authority or by the disciplined followers of the old-school American Medical Association, and therefore they cannot be recognized or heard of. There is an affected dignity among the medical profession which cannot see or feel anything it does not wish to see or feel, which reminds us of a story of two ladies. Said Madam E., a Swiss lady, to Madam R., a French woman, "I was surprised to see you walking with Col. M. yesterday. Do you not know that he was publicly horse-whipped by Capt. D. of the Infantry?" "I do not mind such remarks at all," said Madam R. "for I know that Col. M. is a man of honor and too dignified a gentleman to notice anything going on behind his back."

Speaking of cancer, the press and the political world are greatly concerned at the probable fate of the Crown Prince of Germany, attacked with cancer in the larynx, and with little or no hope of surviving. They announce as the result of the great scientific investigation prompted by this fact, a "great discovery concerning cancer." Is it the discovery of a cure? Oh no; they think they have discovered the *cancer bacillus*. That is science, but as for destroying the cancer bacillus they leave that to the physicians whom they call quacks for curing what the professors cannot cure.

We condense the above from the *Journal of Man*, an ably conducted magazine, recently established in Boston. The facts detailed so closely compared with a similar class of facts existing in this city that we bespeak for them a careful perusal. Our readers are quite familiar with the "Cancer Discussion" in these columns. That discussion has by no means been given up. The practitioner to which so many allusions have been made is still making a successful progress in her work—further note of which will soon be made in these columns. In the meantime, the "faculty" are as denunciatory as ever of the practitioners, but no one has yet denied any of the instances of "cure" which we have given. The most they do is to say the physicians have been mistaken in their diagnoses—that if the patients have been cured that fact is evidence that such instances were no cases of cancer! Could folly and prejudice go further? Their vision is completely obscured by "a scientific cataract."

**THE DEATH-RATE.**—Modern sanitary improvements, says Sir Spencer Wells in a late address before a medical society in Nottingham, England, have reduced the annual death-rate from 29 in a thousand to 19. He further said that it ought to be reduced to 15 or 12. He then said: "And if we have—as we really have—seen the average duration of human life in Great Britain advance from 30 years (which it was half a century ago—to 49 years (which it is now, according to life tables), why may we not witness a still further advance? Why should 70 or 80 years remain as the usual limit of human life? Why should its natural duration under perfectly healthy surrounding conditions not be at least 100 years, with an occasional extension of some 10 or 15 years more."

## How to Keep Warm and Avoid Colds.

Some people may not know that when exposed to a severe cold a feeling of warmth is really created by repeatedly filling the lungs to their utmost in this manner. Throw the shoulders well back and hold the head well up. Inflate the lungs slowly, the air entering entirely through the nose. When the lungs are completely filled, hold the breath for ten seconds or longer, and then expire it quickly through the mouth. After repeating this exercise while one is "chilly," a feeling of warmth will be felt over the entire body, and even to the feet and hands. It is important for all to practice this exercise many times each day, and especially when in the open air. If the habit ever becomes universal, then consumption and many other diseases will rarely, if ever, be heard of. Not only while practicing the "breathing exercise" must the clothing be loose over the chest, but beginners will do well to remember, in having their clothing fitted, to allow for the permanent expansion of one, two and even three inches, which will eventually follow.

One might with propriety say that too many people choke or stifle the skin by an excess of clothing, and, as a consequence, take cold easily. Some impurities are thrown out of the system by the skin, as others are by the lungs, the bowels and the kidneys. It is absolutely essential to health that the emanations from the skin pass easily through the clothing. This—which is called "transpiration"—may be interfered with by an excess of clothing, or by clothing of a very close texture. All who wear india-rubber coats know how uncomfortable they cause them to feel after they have been on a short time. On the accession of Leo X to the papacy, there was a grand procession at Florence in his honor. A little girl was made to personate the golden age by being coated, from head to foot, with gold leaf. Before the day was over she died in convulsions, killed because "transpiration," or, in other words, because carbonic acid gas and dead, worn-out matter, which should have been thrown out by her skin, was shut up in her system by the metallic covering. Ordinary clothing will not, of course, prevent transpiration, but an excess will interfere with it; and when too much clothing is worn the same soon becomes foul, unless the outside air can freely mingle with the gases from the body and so dilute them. Some wear the thickest and heaviest under-vests which they can buy, and such people are very generally the victims of frequent colds. Following the rule of light clothing, they would be much safer from the dangers of exposure were they to wear two light under-vests instead of one very thick and heavy.—*Lx.*

**QUININE.**—This famous drug, which was once as high as \$5 an ounce, has become very cheap by preserving the trees which were formerly destroyed in gathering "Peruvian bark." The drug may now be purchased in quantities at half a dollar an ounce. The trees now yield a crop of bark every year. The fashionable sulphate of quinine, which is most extensively used, I consider the most objectionable form of the drug. My favorite form is the dextro-quinine, made by Keasby & Matteson, Philadelphia. But quinine is not at all a necessity. It could be satisfactorily replaced by Declat's syrup of phenic acid, a French preparation, which is free from the objectionable qualities of quinine. But even that is not necessary, for we have in the willow, the dogwood and the apple tree three American barks which might well replace Peruvian bark by their fluid extracts and alkaloids. To these we may add guaiacum (or life everlasting), an admirable remedy in fever, and other medicines and combinations of value. Our slavish dependence on Peruvian bark has been due to our ignorance.—*Exchange.*

**TEA-POISONING.** It is claimed, hides fair to become chronic. Dr. Bullard gives in the *Boston Medical and Surgical Journal* the details of 74 cases of chronic tea intoxication investigated by him. His conclusions are that the action of tea is cumulative; its action is more pronounced on the young and on those subject to anemia or physically depressed, although persons otherwise healthy occasionally show toxic symptoms; the average amount of the beverage required to produce poisonous effects in persons accustomed to its general use is a little less than five cups per day. Chronic tea-poisoning, Dr. Bullard asserts, is a common affection, its symptoms being usually loss of appetite, dyspepsia, palpitation, headache, vomiting and nausea, and nervousness, combined with various forms of functional nerve affections, such as neuralgia, hysteria, etc. Besides these, constipation and pain in the left side are frequent.

**LEMONS AND FELONS.**—Those of our readers who may have been annoyed with a felon cannot fail to have a painful recollection of the unpleasantness usually accompanying a disturbance of this nature. When a felon first begins to make its appearance, take a lemon, cut off one end, put the finger in, and the longer it is kept there the better. The combat between the lemon and the felon is a fight to the death, and the lemon always comes out victorious, so says one of our exchanges. It will not cost much to try it.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**AMADOR QUEEN.**—*Ledger*, Jan. 21: The protracted siege of litigation which this mine has passed through in the past year has terminated, for awhile at least, by the filing on the 13th instant of a mortgage executed by the officers of the Amador Queen Mining Co. in favor of E. Ginocchio for the sum of \$9464.12, with the interest at seven per cent per annum. We understand that nothing can be done by the company in the way of working the property until this mortgage is satisfied. The mortgage embraces the two mining claims, mill, and indeed all the property of the company in this county except the concentrators in the mill.

**DRYTOWN.**—*Amador Ledger*, Jan. 21: Drytown is situated about midway between Amador and Plymouth. It is a very healthy locality, and in the center of a rich mining district. The quartz-mining interests of this district are looking up, and there are a number of good mines here that only need capital to develop them. The Gover, Loyal Lead, Cosmopolitan, Potosi and several others are being worked with encouraging prospects. In early days this was one of the most lively mining camps in the mountains. The town has been destroyed by fire several times, and each time but partially rebuilt. The placer diggings finally gave out, and the miners and most of the business men sought other fields. No placer mining is being done now, except by a few Chinamen who are working mostly in the bed of the creek.

**LINCOLN.**—The four men who have leased the Lincoln are at work, and it is expected that no further trouble between the Lincoln and Maboney mines will occur.

**AMADOR DIAMONDS.**—*Dispatch*, Jan. 21: It is reported that several diamonds were recently found in the Cleveland mine, near Volcano, but we have been unable to learn their exact size or value. We also understand that two or three of these precious stones were found a number of years ago in the same vicinity, but as there was no one here at that time who understood diamond mining, the matter was soon almost forgotten.

**BUNKER HILL.**—On the Mayflower claim, which belongs to the Bunker Hill Co., and lies between the Bunker Hill mine and mill, a tunnel has been run 1300 feet from Rancheria creek in an easterly direction, at a point about 100 feet south of the mill. This work has been pushed ahead quietly for the last 18 months. At the distance of 1300 feet from the mouth a ledge was cut three feet wide. It has not been opened to any extent as yet, and nothing is positively known about its gold-bearing qualities, but its appearance justifies the opinion that it will prove fair-milling rock. Preparations are now being made to work this ledge. A contract has been let to erect hoisting works at the mouth of the tunnel on Rancheria creek, which is intended to hoist the car of rock 60 feet above the tunnel level, to an elevated track, from whence it will be run to the ore-bin.

**MISCELLANEOUS.**—The Zeile mill has been idle nearly the whole of the week, on account of sinking the shaft. The sinking progresses slowly; only one set of timbers have been placed in position as yet. It is intended to go down about four sets or 20 feet, which will probably take two or three weeks to complete. The main object is to enlarge the ore-chute at the 800-foot level, which has heretofore been altogether too small for the requirements. A telegram was received by John I. Minear, superintendent of the Amador gold mine, from the company's head office in New York, stating that arrangements had been made for the erection of a 60-stamp mill, at an agreed price of \$52,000; the mill is to be in running order by the 1st of August next. Work at the Wetzel claim, near Middle Bar, has been suspended for the present.

## El Dorado.

**SINKING COMMENCED.**—*Georgetown Gazette*, Jan. 21: The new pumping machinery at the Alpine mine, 2½ miles southwest of town, is in place, and sinking has been commenced.

## Inyo.

**SAN CARLOS MINE.**—*Independent*, Jan. 21: At the San Carlos mine recent developments are very favorable. An ore body was struck a few days ago in the tunnel the extent of which is not yet known. The vein is 3½ feet wide, and of this two feet is solid ore. On Wednesday one man took out a ton of this that is worth \$100. At the beginning of the tunnel the ground was very hard, but during the past month it has been much easier. Mr. Russell is pushing the work along as usual.

## Mono.

**BODIE.**—S. F. *Examiner*, Jan. 24: Ex-District Attorney Richard S. Miner of Mono county leaves for his home in Bodie to-day. Captain John Kelly, superintendent of the Lent shaft of the Bodie and Mono Co.'s, arrived yesterday. They report that the roads in and about Bodie are now open, and that work is progressing steadily on the aforesaid shaft, and on the Standard Co.'s property. A few other less noteworthy prospects are also being worked, and in all about 100 miners are working at Bodie. It is expected that the Lent shaft will reach a second contact, and if it does, a new impetus will be given to mining there, so they say, and the camp which in 1880 had nearly 9000 people, and which now has only about 700, will forge to the front rapidly. "One thing that is against working our low ores," said they last night, "is the high price of labor. Bodie and Virginia City are the only mining towns in this section of the coast that are paying \$4 a day. If we could get the work done for \$3 to \$3.50 a number of other mines would be worked. The Standard has recently paid a dividend of ten cents a share."

## Nevada.

**COLUMBIA HILL MINING DISTRICT.**—*Nevada Transcript*, Jan. 20: Mr. Bigelow, who is running 500 feet of tunnel for the Delbi Mining Co. on a contract made at \$10 a foot, had for some time found the ground very hard and the profits correspondingly small. Recently, however, soft ground was entered and the works are now going along swimmingly much to the gain and general satisfaction of the

contractor. At the El Dorado the contractors recently quit work on the tunnel by consent of the owners, the ground being so hard as to render the job a losing one at the specified rate. Three men who are paid day's wages are driving the tunnel, and it is estimated that they will reach the ledge within a distance of 80 feet from where they now are. A. E. Helm and G. Jones have relocated the claim called the Pittsburg and situated on the north bank of the Middle Yuba which was taken up last year by Messrs. Englebright, Beckwith & Co., of this city. The latter gentlemen did not perform \$100 worth of labor on it in 1887, but as they did not locate it till after January of that year they claim that it is not yet open to relocation. The old San Juan ditch on the Middle Yuba is said to be falling into decay so far as its flumes are concerned. It is reported that the Grant Mining Co., which has been depending upon it for water, will therefore build a dam in the river some distance above their claim and bring the water down in a private ditch which will give them ample power. The Nevada City gentlemen who own the south extension of the El Dorado have named their claim the Dictionary. They say they selected this title "because the dictionary is the only thing that contains health, happiness and prosperity." They expect to find health in taking frequent trips up to the mine, happiness in anticipating that it will prove the biggest bonanza in the county, and prosperity in the golden returns they will realize when they once get it developed.

**MAYBEST.**—*Cor. Nevada Transcript*, Jan. 20: During this extreme cold weather we have kept our hoist and pumping machinery running with a few hours stopping in the morning to cut ice out of flumes and bulkheads. Since the 14th inst. it has been too cold to run the mill. Water freezes in the feed pipes and in the silver plates. Here again we have an illustration of the superiority of the hurdy over the overshot water-wheel. The hurdy wheels are free and running, where overshots are froze solid until the next thaw relieves them or the dangerous work of cutting them loose is resorted to. The latter endangers life and machinery. The Eagle Bird Mining Company had been running only their pump for some time. Finally it ceased to do duty. Their aqueduct froze solid. The mines that have been crushing ore in this district have paid well up to the time Jack Frost shut them down. Some of the prospectors have suspended operations until warmer weather. Those that have tunnels to work can keep to work. I am informed that Tiernan has resumed work in his tunnel on Lindsey Hill. The Cressus Co. have been fitting up to sink a shaft on the pay chute in their tunnel. The expectation is that there will be mills running this coming season on the Cressus, Blue Jay, Rising Sun and Tiernan mines. John Grissel and Foster intend starting their mill to crushing ore from the old Champron or Governor Morton mine as soon as the weather permits. When the above mines, which are all proving valuable, get machinery erected and crews of men to work, then the South Yuba river will be one of the leading mining districts in the county of Nevada.

**NORTH BANNER MINE.**—*Grass Valley Union*, Jan. 21: Thursday, this reporter in company with Mr. George Fletcher, managed to make his way to the mine of the Consolidated Tunnel Company at Banner Hill. The tunnel is now in about 900 feet, and is being pushed ahead as rapidly as is necessary. About 100 feet from the face of the drift an upraise of about 48 feet has been made, uncovering a ledge of quartz which would be an excellent thing for any mine to hold within the confines of its treasure chambers. The ledge varies from two feet to three and one-half feet in thickness, displaying on its lower side rich ribbon rock, literally filled with sulphurets and galena, while the entire ore from the large ledge is considered No. 1 milling rock. In the face of the drift this same ledge is beginning to show itself, and no doubt but that a few feet further on the miners will run into it, disclosing its full size and beauty. The owners of the North Banner have reason to feel proud over their late developments, for every one who has seen the ore spoken of above unhesitatingly pronounces it of exceptionally good quality. Then the general surroundings are very flattering. The walls in many places show sulphurets of good quality. This "cap sulphurets" is considered to be the very best indication. The sulphurets from the ledge are very rich, in fact the ore itself is high grade, and much of it will be shipped to the smelting works, San Francisco, for treatment, as it contains a very large per cent of silver. With the employment of a comparatively small number of miners, ore enough to run a 20-stamp mill can be easily extracted from the Banner. There are now only five stamps in the mill at the mine, and they will be dropped as soon as the company can get water. Mr. Wm. May, an experienced millwright, has just finished the job of putting in two new Triumph concentrators, and the entire mill is now in readiness to run, with its ore station filled with as lively looking quartz as one would wish to see.

**RICH GRAVEL STRIKE.**—*Foothill Tidings*, Jan. 20: After running a tunnel and sinking three shafts, Alfred Jenkins, John Cunningham, Joseph Bartell and others have discovered a gravel channel near Rough and Ready. The bank is five feet thick and is of cement gravel which pays \$1 to the ordinary windlass tubful. One or two rich cleanups have been made, the cement being worked by the washing process. A whim is now to be erected and the channel prospected sufficiently to determine whether or not the construction of a mill will be warranted. Messrs. Jenkins & Co. have a lease of the claim with the privilege of purchasing. A recent organization styled the "Pet Gravel Mining Company" have bonded the extension of the claim operated by the parties named in the foregoing, and will commence work as soon as weather permits. It is very likely mining for gravel will shortly be very lively in the neighborhood of this strike, as indications lead to the belief that the tail end of the old Alta Hill lead has been found.

**PAY GRAVEL.**—*Foothill Tidings*, Jan. 18: Chas. Mill and a company of practical miners have been working the Old Jennie Lind gravel claim, situated back of Alta Hill, for several months past. A good-sized bank of cement gravel, which prospects exceedingly well, has been encountered, and now a 10-stamp mill is in course of erection, a sufficient indication that there's pay in sight.

## Placer.

**GOLD.**—*Placer Herald*, Jan. 21: Harold Power last Monday brought down 300 ounces of gold, the

December cleanup of the Hidden Treasure mine at Sunny South.

## San Diego.

**ELSINORE COAL.**—*Pasadena Union*, Jan. 21: A carload of Elsinore coal from the Cheney coal mine, in San Diego county, was side-tracked at South Pasadena Saturday evening, consigned to D. M. Graham, one of the owners of the mine, who resides at that point. This is the first carload of coal ever shipped from this mine, and is also the first carload ever mined in Southern California and shipped away from the mine. It is the initial car of many to follow and marks an important era as the beginning of a new industry in Southern California. The coal, while slightly inferior to the Australian coal, ignites readily and burns to a clear white ash. The Cheney coal mine is six miles from Elsinore station, but when at that distance the coal can be mined and placed on the cars and shipped to this city at one-half the present ruling prices. The Elsinore & Pomona railroad, now in course of construction, will run by the mine, and the coal can then be mined and shipped to this city and Los Angeles at a cost not to exceed \$4.50 per ton. Mr. Wm. Collin, one of the owners of the mine, was in this city Saturday and informed a *Union* reporter that they had lately opened up a ten-foot vein, and the farther in they drifted the better they found the coal. Too much importance cannot be attached to this item, as the scarcity of fuel and the cheapness with which this very desirable article can be obtained is something which will interest every citizen in Southern California.

## Sierra.

**TO BE REOPENED.**—*Foothill Tidings*, Jan. 20: The old Graphtine mine in Sierra county, a mile above the Plum Valley House, is to be reopened in the spring by a strong company. Eight years ago more or less work was done on the claim and a stamp-mill erected.

## NEVADA.

## Washoe District.

**CROWN POINT.**—*Virginia Enterprise*, Jan. 21: Are not taking out any ore now, on account of the lack of milling facilities, and will not until the expiration of the lease of the Mexican mill to the Savage and of the Vivian to the Hale and Norcross, but active prospecting work will be prosecuted.

**BEST AND BELCHER.**—On the 425 level west crosscut No. 2, opposite east crosscut No. 2, has been extended 23 feet; total, 358 feet. The formation continues in block porphyry. East crosscut No. 3, 400 level, 400 feet north of south line, has been extended 45 feet in vein porphyry and quartz. West crosscut No. 2, opposite east crosscut No. 1, has been extended 34 feet; total, 91 feet. This crosscut has passed through vein porphyry and has penetrated the footwall of the vein.

**OCCIDENTAL.**—No. 1 upraise in the upper tunnel of the north incline winze has been carried up 10 feet; total height, 49 feet. No. 2 upraise, 74 feet north of the north incline winze, has been carried up 12 feet; total height, 61 feet. At the top of the south winze connection on the 48 level, a south drift has been advanced 8 feet. From the openings have extracted 35 tons of fair-grade ore. Are re-remembering a portion of the lower tunnel and repairing the track.

**HALE AND NORCROSS.**—On the 400 level the north drift is advanced 45 feet and the south drift 48 feet. On the 700 level the ore development shows further improvement. From the top of the south upraise they have drifted north 25 feet, and all the drift continues in excellent ore. The south upraise is now 60 feet above the track floor and continues in fine ore. The severe cold and stormy weather has temporarily interrupted the reduction of ore at the mills.

**SAVAGE.**—On the 600 level the south drift was advanced 30 feet, and the face of this drift is entering ore of good grade. Are extracting ore from the several levels between the 400 and 900 stations. The freezing of the Carson river still prevents the usual shipment of ore to the Mexican mill.

**BELCHER.**—The 500 level south drift is in 73 feet in favorable-looking ground. The management will commence crosscutting immediately on the 400 level, 240 feet south of the line, but will not commence crosscutting on the 500 before two weeks, or until the 500 level south drift of the Crown Point reaches the line.

**YELLOW JACKET.**—The usual work is going on in the mine, and are shipping 230 tons of ore daily to the Brunswick mill, which is running on steam. As soon as the river thaws out they will run with water-power again. They have 500 tons of ore at the Santiago awaiting that mill to start up for reduction.

**UTAH.**—The east crosscut on the 422 level from the north drift from the end of west crosscut No. 6 has been extended 30 feet; total length, 80 feet. This crosscut has passed through the clay and quartz mentioned in last report, and the face is in hard porphyry.

**GOULD AND CURRY.**—Small drifts are being run in the old stopes on the 250 and 300 levels, and some good ore is found. The south drift on the 1300 level from the east crosscut has been extended 41 feet; total, 144. Formation, porphyry with streaks of quartz.

**CHOLLAR.**—The work of sinking the incline to the Suro tunnel level is progressing. General progress is reported in the several drifts throughout the mine. Are fitting up the other half of the mill to run according to the Logan process.

**SCORPION.**—The severe, cold, stormy weather has interrupted work at the mine since the last report. The usual work was resumed Tuesday. The north drift is advanced 60 feet and the south drift 52 feet.

**ANDES.**—Are running west on the 350 level, and drift now in porphyry. Running east on the 240 level and occasionally encounter quartz containing a little ore.

**WEST CON. VA. AND CAL.**—Good progress is made in sinking the shaft. Have had a little surface water to contend with during the week.

**SEGREGATEO BELCHER.**—The southwest drift from the raise is now in 60 feet. The ground run through shows no change for the week.

**ALTA.**—The past week have been thawing out

pipes preparatory to the resumption of the usual work at both the mine and mill.

**MONTEZUMA CON.**—The very severe weather of last week delayed operations, but are now doing work in the tunnel.

**BULLION.**—The shaft has now attained a depth of 450 feet and the work is progressing well.

**POTOSI.**—The stopes on the upper level are yielding their usual quantity and quality of ore.

## Columbus District.

**CANOE LARIA.**—*Walker Lake Bulletin*, Jan. 18: The Candelaria mill is running 20 stamps continuously upon ore from the Georgene mine. In this mine a large body of ore has been developed in the east drift from the second shaft level. The face is three feet wide and of good quality. The first level and the intermediate levels between the first shaft level and the tunnel level are producing high-grade ore. The third level shows low-grade ore in the face of the east drift. It is rumored in Candelaria that the Holmes mine is about to change hands and be worked by the Candelaria Co. Col. Sutherland was interrogated regarding the rumor and he refused to either admit or deny its truth, but the general appearances indicate that a change will soon take place, in which event work will be vigorously prosecuted and Candelaria will be again one of the most prosperous mining camps in Nevada.

## Dun Glen District.

**ANOTHER MINE SOLD IN THAT CAMP.**—*Silver State*, Jan. 18: Dun Glen is experiencing a mining boom and the prospects are fair for the camp becoming one of the liveliest in the State in the spring. Last week J. V. McCurdy purchased the Lang Syne mill and mine, and now Thomas G. Morgan has purchased the Golden Chariot mill and mine of Thomas & Hendra. Both purchasers are live men and experienced miners, and intend to increase the capacity of the old reduction works materially by the addition of Huntington crushers and concentrators to the present stamp-mills. Mr. Morgan was superintendent of the Pittsburg mine in Lander county up to the time it was sold to its present owners, and Mr. McCurdy is superintendent of the Paradise Valley Mining Company. The mines, which adjoin each other, are both gold-bearing and well-defined leads. A force of men will be put to work on each as soon as the weather will permit, the Lang Syne being under the superintendence of T. D. Soper, and the Golden Chariot under that of L. W. Getchell of Austin.

## Hawthorne District.

**LAPANTA.**—*Cor. Reno Journal*, Jan. 21: The first mine I visited was the Lapanta. This mine was discovered in 1886 by Mr. John T. Bradley and afterward passed into the hands of Messrs. Yerrington, Bliss, Senator Forbes, Tohey, Knapp and Laws and the Garfield Mill and Mining Company. The mine has produced over \$100,000, 25 per cent of which was divided among the owners. This amount was the result of one year's labor in 1886 and 1887. After that the mine was regularly incorporated and embraced the well-known claim now known as the Esmeralda, which is to-day the eastern extension of the Lapanta. When this incorporation was perfected the company immediately set about to develop the resources of the section in which both mines were located. Since that time they have spared neither time nor money to determine its value. The result of the last run of 135 tons made at the Kinkaid mill, nine miles north of the Lapanta and on the line of the C. & C. railroad, resulted in a total production of \$14,000. This speaks for itself, which I noticed, as I did in the Georgene and other mines in Candelaria, that they had large bodies of ore in sight. This mine is composed of free milling decomposed quartz and the average per ton of its productions can easily be determined by the above figures. The profits arising from this valuable property are not so much due to the intrinsic value of the ore as they are to its close proximity to the railroad and more especially to the fact that the mill is on its line. After completing my investigations in the Lapanta, I proceeded to the famous Pamlico mine and there I learned it was located in 1878 by its present management, Senator Forbes, H. M. Yerrington and D. L. Bliss. The mine is superintended by Mr. S. V. Hauger and is in splendid condition. It lies about one mile south of the Lapanta and employs quite a number of men. Since that time it has declared three dividends and is still being worked to great advantage. The last dividend declared netted the stockholders something over \$700 per share, while the ore taken from it, now being crushed at the Kinkaid mill, is as rich as any that has yet been taken from its recesses. The ore is of a similar character as that of the Lapanta, but is found in a different formation, being porphyry and talc, while that of the Lapanta is in limestone. This mine is one of many in the Hawthorne district that enables the Kinkaid mill, owned by Senator Forbes and S. A. Knapp, to be kept in constant operation. Capital is wanting here and prospects are numerous, while several properties are being worked successfully.

## Silver Peak District.

**MILL CLOSED.**—*Esmeralda News*, Jan. 21: Owing to the severity of the weather and the consequent freezing of water-pipes, the Silver Peak mill is closed. It will resume work in about ten days. The snow has not obstructed the road between Candelaria and Silver Peak. The stage makes its regular trips. The Shawmut Mining Co. continues to extract and ship large quantities of ore from its mines at Montezuma district to Candelaria.

## Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Jan. 21: East crosscut from west vein, 250-foot level, extended 4½ feet.

**NAVAJO QUEEN.**—Have sunk and timbered 7 feet during the week; total depth of shaft, 173 feet.

**PONDERE.**—Are making excellent progress with east crosscut, the ground working very favorably.

**FOUND TREASURE.**—Crosscut, 150-foot level, has been run 30 feet during the week. The gangway vein, which carries the same grade of ore at this point as it does in the gangway of old works, has been reached, and a drift started on it.

**NEVADA QUEEN.**—South drift on the 100-foot level has been advanced 15 feet; total, 61 feet. North drift, same level, has been extended 19 feet; total, 103 feet. 350-foot level, No. 2 crosscut, has been driven 17 feet. Strata of softer porphyry are en-

countered every few feet; looks favorable to soon get into better working rock.

**NAVAJO.**—South drift, west vein, 350 level, extended 4 feet; west crosscut No. 2, same level, extended 6 feet; face in both looking favorable.

**COMMONWEALTH.**—North drift on the 100-foot level has been advanced 12 feet, the ore being very regular, ranging from 3½ to 4 feet thick. Average assays of ore hoisted during the week, \$286 per ton.

**NORTH BELLE ISLE.**—North drift from No. 3 crosscut, 70-foot level, extended 8 feet, total length, 27 feet. Ore continues high grade. The stopes are looking well and continue to yield as usual.

**GRAND PRIZE.**—South intermediate drift from winze No. 1, extended 10 feet; total length, 41 feet; face of same still showing a strong ledge of high-grade ore. Stopes from winze and above the drift turning out well.

## ARIZONA.

**TURKEY CREEK DISTRICT.**—Prescott *Courier*, Jan. 18: Thomas Roach, of Turkey creek district, is stopping at the Pioneer hotel. He is an owner in a rich silver mine and has shipped a great deal of ore which has brought big money to this town and section. Mr. Roach is not a talking man, but we, nevertheless, coaxed from him the information that John Holmes has some very rich ore in his dumps; that Mr. Henszey has succeeded in his efforts, the result of which will be the addition of ten more stamps to the Morning Glory mill and the working of several gold properties, early next spring; that Capt. Brann has very rich ore in the Volunteer mine. F. M. Murphy has news of the finding of a very rich deposit of loose ore in the Congress mine, Martinez district. Ore is rich in gold and easily mined. T. W. Groves, a Colorado miner, has been in Big Bug district, and speaks in high terms of the Boggs mine and others. He will next visit Walnut Grove district; says that if several mines he has seen here in any part of Colorado, they would be worked and paying dividends.

**MILL WANTED.**—Clifton *Clarion*, Jan. 14: Clifton should have a custom-stamp mill by all means. It is probably the only way in which our claims can be developed and made salable. Shipping ore never proves satisfactory to mine-owners, but rather tends to discourage them on account of the large portion of the value of the ores being eaten up in transportation. That a custom-mill would pay in the district there is no doubt. It is estimated that there is gold ore enough on top of the ground in the district to keep a 10-stamp mill running a year at least at a good profit to both mill and mine-owners; and there is not a gold claim here that has been developed worth mentioning.

**SQUAW CREEK.**—Letters from well-known miners and others, at the Clarence-Ruby mine, in Squaw creek, contain good news. The mine is large and very rich in gold. The mill was erected under great difficulties, by Mr. Robert Cartmell of Prescott, who has made a success of it. It was started recently, and after a 24-hours' run \$400 in gold was caught on the plates. The concentrates contain about as much more. So the trial run was a success in every respect, and we are pleased to record the fact, for the sake of the county, the superintendent, N. Ellis, and the mill constructor and runner, Robert Cartmell. Frank Alters, just from the Catacino mine, informs us that a new body of ore recently found by him in the mine assays 450 ounces in silver and \$60 gold per ton.

**SILVER.**—Prescott *Courier*, Jan. 18: Jos. Howell has arrived from Riggs Lawler's great mine. It is four feet thick in the shaft and very rich in silver. Can't ship, owing to muddy roads. Thousands of tons of high-grade ore in sight. Experts who have examined the Lavler copper mines pronounce them the richest in the west. The Senator mine, Hassayampa district, which yielded half a million in gold, will be worked next spring. Not an inch less than 100 feet in width is Dan O'Boyle's Montgomery mine. It is gold bearing; can be concentrated very effectively. Sam Bright, who owns the richest piece of quartz that came from the Howard mine, has consented to place it in one of Kelly & Stephens' show-cases. It is about the size of a hen's egg and the owner would not take \$100 for it. Howard people are now taking out very rich ore. The Bank of Arizona had yesterday about \$10,000 worth of quartz and placer gold, which was taken out in the last week.

**ETTA.**—Prescott *Courier*, Jan. 21: The Etta gold mine is in Cherry district, about 35 miles east of Prescott. It was discovered and worked by Jack Hardy and others, who sold it to prominent business people of St. Louis, Mo. Their agent here, John J. Hawkins, contracted with two good miners, John S. Johnson and Thomas Reese, to sink the shaft deeper and run the tunnel to a connection with it. The work is completed. The shaft is in the neighborhood of 200 feet deep; tunnel 275 feet long, and the vein, which is rich in gold, is from four to six feet thick. More miners will soon be put at work in it, and, as the company own a ten-stamp mill on Verde river, about four miles from the mine, bullion, in large quantities, will soon be shipped from the Etta, which is, to-day, considered the best gold property in Arizona.

**HOWARD.**—The Howard gold mine, ten miles south of Prescott, is still in a very healthy condition. The small shaft is, as yet, scarce 30 feet deep, and yet about \$30,000 in gold has been taken out of it. W. W. Vanderbilt examined the property Thursday last, and yesterday stated that it was in splendid condition. One of its owners, Mr. Barrington, was in Prescott yesterday and confirmed what Mr. Vanderbilt said of it. They are now drifting north and south, getting rich pieces of quartz and plenty of ore that will pay well when pulverized in an arrastra. The owners run an arrastra by water-power.

## DAKOTA.

**GOOD ORE.**—Black Hills *Pioneer*, Jan. 14: Lessees of the Adelphi, Carbonate camp, are said to have struck some very good ore in the mine, which they are following, it increasing in size as their explorations continue. A bonus of several hundred dollars has been offered for the lease, which was promptly declined, the boys being confident they have a good thing, and willing to stick by it. M. R. Russell, on behalf of the National Gold Mining and Milling Co., Wednesday filed application in the

land office for patent on the Segregated I. N. L. claim, located in Poorman gulch. The property is well developed, shows a good body of free-milling ore, and is likely, after further development, to prove as valuable as any mine in Whitewood district. It was stated yesterday, by a man just in from Carbonate, that an excellent quality of ore is now being taken from the Wilkinson shaft. Ore shipments from the Spanish R. will be resumed early next week. There are at present on the dump some 25 tons ready for transportation to the Iron Hill smelter. A day and night shift is being worked with most encouraging results, not a few well acquainted with the property positively asserting that before the year is out this mine will rank second to none among silver-producing properties in the Black Hills.

**NIGGER HILL TIN.**—Deadwood *Pioneer*, Jan. 17: Charlie Finch, an old Bear gulch miner, reports the work done at that camp during the winter as being greater than any previous one for several years past, and with better results and prospects. Some 35 men have been constantly working on the several properties, and the result is that a feeling of confidence has deepened and strengthened with all that bodies of tin ore exist in larger extent than had formerly been thought. Orders have been received from Mr. O'Brien, in New York, to pump the water out of the Cleveland shaft, as the officers of the company would visit the property within a short time, with the intention of commencing operations in extending mining and constructing concentrating works. The Cleveland shaft is 150 feet deep with a crosscut at the 100-foot level 140 feet, all in tin ore. At the bottom of the shaft the ore body increases in quantity and quality.

**CUSTER CITY TIN.**—Samuel Cushman of Custer City says: "Mr. Tanlin, the former county treasurer, drove me out to the Tin Mountain Company's new concentration-mill, and on our return I had the pleasure of dining with him and his excellent wife. The mill had made a trial run and it was found, as might be expected, that some things could be changed to advantage, hence it was not running the day I was there. Mr. A. L. Sirger, the superintendent, gives every detail of the work his personal attention. He has tackled one of the most difficult problems in practical metallurgy, and one of the most hopeful signs that he will succeed is the fact that he is aware of it. He has satisfied himself and all who have investigated that his general scheme of concentration is all right, but that to do satisfactory work he may have to increase his power and modify some of his apparatus. The company at his back is a strong one, including such men as McCormack of reaper fame and millions, Bartlett of Spencer, Hubbard & Bartlett, and other successful men who have taken hold not as a flyer but to win. Confident, as is every one who has investigated, that there is plenty of tin ore and that they have a good mine, they have determined to head the column in finding how to utilize it. The property is about eight miles westerly from Custer and is part of a great group of tin locations, one of which was lately sold to the Harney Peak Company for \$40,000, they paying \$5,000 down. North from Custer is another large group of tin mines; also another in the vicinity of Hill City or Spring creek."

**HAYES.**—Deadwood *Pioneer*, Jan. 14: At the Hayes, work is being pushed on the second contact with most satisfactory results. The force is employed on ore, and that now extracted from the tunnel runs as high as 800 ounces silver per ton. It is principally carbonates and sulphurets, with occasional streaks of galena appearing. The Hester A. company is now pushing developments on the second contact, employing as large a force as can be worked there to advantage. Considerable high-grade ore has been extracted, of which two carloads will be shipped to Omaha next week.

## IDAHO.

**RUMORS.**—Wood River *Times*, Jan. 11: It is reported that 10 feet of solid galena ore was cut in to at the bottom of the Idahoan shaft, yesterday. The superintendent has been expecting ore for a few days, but hardly that width of it. If the report is true, the Idahoan will, ere long, resume her former place and rank as the banner mine of Idaho. Another rumor, which has been afloat for about one week, is that a vein of 1000-ounce ore was struck, during the holidays, on the Bullion tunnel level by the miners in Professor Jenney's employ. This, too, is not much of a surprise. In fact, it would have been much more surprising if the strike had not been made once operations were conducted to that end, in that direction. With the Idahoan resuming dividends, the Bullion-Ophir-Durango ditto, the Red Elephant building a concentrator, the Rising Sun running to connect with the Bullion-Durango tunnel, the Mayflower resuming work on a large scale—all this to be under way about March or April—Bullion ought to boom next summer.

**GRAHAM.**—Cor. *Inter-Idaho*, Jan. 11: The town of Graham is about 60 miles in a northeasterly direction from Idaho City, and is situated on the banks of the North Boise river, about 12 miles below its head. This river forms the boundary line of Boise and Alturas counties. The mines are located in the neighborhood of one mile and a half from the millsite, from which there will be a tramway built in the spring to convey the ore to the mill. The Julia is the principal mine of the district, and it is estimated that the body of ore already in sight in this mine is large enough to run a 20-stamp mill for several years. Besides the group of mines owned and worked by the company, there are several prospects which look very promising. Before leaving here Col. Matt Graham, one of the principal owners and general manager for the company, made all necessary arrangements for the construction of as much of the mill as possible this winter and to otherwise facilitate matters for spring. Mr. Mahan, the master mechanic, and Mr. McCarthy, foreman, have been as busy as beavers up to this time drafting and framing, notwithstanding the inclemency of the weather. It is calculated that there will be 200 to 300 men at work here on the mine, mill and tramway in the spring—a fact which gives a pleasant outlook to the future prospects of North Boise. It is useless for any one to attempt getting in here till spring, except on snowshoes, as there is 10 feet of snow on the summit between here and Idaho City, with frequent snowslides, which makes the trip extremely perilous.

**EAST FORK OF SALMON RIVER.**—Ketchum *Key-*

*stone*, Jan. 20: The Parnell mine, located in the Germania basin, reports say, is looking extremely well. The development work that is being done this winter is opening up large bodies of high-grade ore. Only two miners have been employed during the winter, and they are extracting two tons of high-grade ore per day with fine reserves in sight. The Bible-back mine is also located in the Germania basin, and owned by Chris. Johnson and others, who have great faith in making a mine of it at no distant day. The present developments are looking very favorable and encouraging.

**GALENA.**—The Alturas Consolidated Mining Co., having headquarters in New York City, owning an extensive group of mines at Galeña, are extending their tunnel to strike their Gladiator lode at a depth of from 400 to 500 feet. The tunnel has attained a distance of 700 feet in length, and according to survey must be nearing the ledge, unless the pitch has materially changed from its angle ascertained near the surface.

**WELLINGTON.**—The mine is now being worked under a lease with favorable results. A great deal of work has been done on the mine, and it has produced a considerable quantity of ore of a good grade for the past two years; no depth of any consequence has yet been reached.

**SMOKY.**—Reliable information received from Smoky states that a fine strike has recently been made in the Tyrannus mine, owned by J. M. Carter and others. We have not been able to learn full particulars of the development. The Fairview mine, owned by Messrs. Hughes, Nebbler and Kelly, located in Smoky, is said to be prospecting remarkably well.

## MONTANA.

**NEW REDUCTION WORKS.**—Butte *Miner*, Jan. 17: Mr. W. A. Clark is now negotiating a sale of his Colusa mine, concentrator and smelter, and his interests in the Mountain Chief and Piccolo, to the Boston Consolidated. The price to be paid is in accordance with the importance of the deal. This sale will enable Mr. Clark to concentrate his energies on the important works he now has in preparation. It was stated in the *Miner* some days ago that the matte furnaces of the Butte Reduction Works were being enlarged, and it can now be added that new reverberatory furnaces have been ordered and will soon be placed in position at the works. As soon as spring opens new concentrating works of large capacity will be erected. These works will be for treatment of copper ores from Mr. Clark's properties here and the Bell mines at Thompson Falls. If he can obtain reasonable rates from the Northern Pacific for the transportation of galena ores from the Cœur d'Alene, he will also erect large lead works, and it is not likely that the railroad will miss the large traffic that will thus be insured.

## NEW MEXICO.

**ORE.**—Silver City *Enterprise*, Jan. 20: The car of ore shipped from the Asiatic mine at Pinos Altos by the Ateste company turned out very well, and it demonstrates beyond any question the value of the property. The ore ran \$30 in gold and silver and 15 per cent lead, making it run all told about \$40. The ore was an average of the dump, and if anything, lower than what the ore now being taken out is.

**CONCENTRATES.**—A carload of concentrates will be shipped from the Key to-morrow. The last shipment of concentrates averaged \$200 per ton. About 170 ounces of gold retort will be shipped from the Key about the 25th instant.

**BANNER.**—Nick Rascom came in from the Banner last week and reports everything prosperous at the mine. If the Banner company would erect a mill it would have a good-paying property. Ore that will pay to haul 40 miles ought to be a regular bonanza.

**BOSS.**—Twelve sacks of ore are ready for shipment from the Boss mine near Georgetown, which is expected to net \$4000 or more. Some of the ore is worth from \$7000 to \$2000 per ton. Malcolm McGregor recently bought a one-third interest in the mine for \$1000, and this shipment will more than pay the money back.

**MOGOLLONS.**—Capt. M. Cooney came in from the Mogollons this week. He has now got his mill on the ground, and will soon be ready to start up. His mill is situated in a canyon between two of his mines, one of which will average four feet of \$50 ore. The vein has been uncovered at different places on top for 4500 feet. The Captain estimates that he can mine and dump his ore on the grizzlies at the mill for \$1 per ton, and be in confident that he has a world of it.

**UNFAVORABLE.**—People familiar with mines in Mogollons anticipated an unfavorable report on the Sheridan mine by John B. Farrish, and they were not mistaken. His report was a hard blow to the stockholders, many of whom even yet have confidence in the property. Mr. Farrish, after a careful sampling finds the ore taken out for treatment by Superintendent Harlan to be almost worthless. In substance he advises the stockholders to abandon the mine. Mr. Farrish has an excellent reputation in this section as an expert and general good practical mining man, and great weight is given his opinion notwithstanding his examination of the mine must have necessarily been very hurriedly made, as he spent but one day in the camp. His assays of ore are understood to have been from \$2 to \$10 per ton.

**VIRGINIA.**—Socorro *Bullion*, Jan. 14: The Virginia mine, located at Kingston, and formerly owned by Wallace, Parks & Evans, has been sold to the Templar Mining Co. for \$150,000. This camp is rapidly becoming noted for its rich mining properties and may prove a second Leadville. I. S. Lapham reports the Pinos Altos district in a prosperous condition, and says that the Silver City people place great confidence in the future of that camp. The Aztec Co., in which Col. Lapham is a prominent stockholder, controls ten claims, and it is the company's intention to sink the properties to depths ranging from 200 feet to 500 feet during the year. The ore bodies on some of these mines were but 15 inches when work was first commenced on them, but they are now five feet wide and steadily increasing. Among the mines now being worked are the following: The Mountain Key, in the hands of a St. Louis company in which Gen. Boyle is the principal

stockholder, is now down about 3000 feet, and the mineral increases in value as depth is attained. The mine produces gold ore which runs \$125 to the ton. The parties interested in this property are spending money freely in its development. Wm. Nourse, one of Hermosa's leading mining men, brought three carloads of ore from the Pelican-Eagle group to the Socorro smelter this week. This group consists of the Pelican, Vulture, Eagle and Albatross mines, all of which are rich-paying properties. The ore brought here runs \$152 and \$185 per ton. A lease for 250 feet has been let to Donald McRae and one for 300 feet to Wood and Read on these mines.

## OREGON.

**THE POCAHONTAS MINES.**—Cor. *Bedrock Democrat*, Jan. 20: I have noticed in recent issues reference to mines, placer and quartz, situated in Pocahontas mining district, and while you seem to be well informed regarding the district you have overlooked several mines worthy of mention. August Pulnoi is the owner of a valuable placer claim in this camp, and has, perhaps, produced larger nuggets than any claim in the district. J. H. Ingraham is also the owner of rich placers situated on Mill creek about 1½ miles from the celebrated Salmon creek purchased by Oakland, Cal., capitalists for the enormous sum of \$335,000. The Ingraham mine has a fair resemblance to the Salmon creek placers, and has every evidence of being just as extensive and valuable. The placers of Pocahontas district are evidently fed by a gold-bearing quartz range that overhangs the placers. The principal gold-supply vein is the Tom Payne mine, owned and worked for the past seven years with great success by Mr. G. L. Hayes. This mine is favorably situated for supplying the following placer mines with free gold: August Pulnoi's placers, on Crack Pan gulch, which gulch crosses the Tom Payne ledge only a few hundred feet above the placers; the next gulch supplied is the McCord gulch, one of the richest gulches ever worked in the camp. The Tom Payne ledge crosses this gulch about one-half mile above the mouth of the gulch. Every evidence tends to show that this ore vein is the feeder of these gulches, and the ledge can be traced to where it crosses the Salmon creek placers about one mile above the mines. I was talking the other day with the owner of the Tom Payne mine; he informed me he had found a prospect of \$5 to the pan, at a depth of 150 feet from the surface. Ed Hardy, Joseph Manaudas and J. H. Cavin own a valuable quartz mine only a few hundred feet south of the Tom Payne mine.

## UTAH.

**CRESCENT.**—Park *Record*, Jan. 16: Splendid progress is being made with developments in the Crescent, and the results are proving to be fully equal to the expectations of the most sanguine. The winze is now down 214 feet and a large station is being cut out of the ore body. As soon as the station is cut drilling on the vein northeasterly and southwesterly will be commenced. From the first station over 200 feet of drifts on each side of the mammoth incline shaft have been run, and large quantities of high-grade ore extracted from the contiguous stopes. As depth is attained on the vein it increases in size and richness.

**THE SAMPSON WORKINGS.**—About 35 men are employed at the Sampson, and developments are going ahead with great vigor. The stopes continue to look well, and whenever the condition of the road admits of it ore shipments will go to market. Drifting and stopping on the upper levels are being pushed, and by spring the vein will have been advantageously explored. Excellent drainage and good air circulation have been the rule and not the exception since connection was made from the old workings to the drain tunnel.

**AT THE ANCHOR TUNNEL.**—Work in the Anchor drain tunnel is going ahead again with all possible speed, and the usual rapid headway is being made. The disastrous snowslide on the 4th inst., however, caused a slight interruption in the progress of the work. Within a couple of months or so the connection with the intermediate shaft workings will have been made. The total distance reached so far is about 1900 feet.

**ONTARIO NO. 2 SHAFT.**—Sinking on No. 2 shaft of the Ontario is still being pushed and the 1200-foot level will soon be reached. After a station is cut and a large steam pump set to work, drifting on the course of the vein will be commenced.

## WASHINGTON.

**MINES OF SALMON RIVER.**—Ellensburg *Capital*, Jan. 20: The estimate made by parties familiar with the Salmon river mines, that fully 10,000 people would be attracted to that country this year, is by no means an exaggerated one. Prospectors have demonstrated that the country is extensive enough and the mines permanent and rich enough to support a large population. And yet the country has only been prospected. When it has been developed and the mines opened to a degree of productiveness requiring the establishment of mills, smelters and reduction works, no one can state the number of people Salmon river will support. The mines are in their infancy, the deepest scarcely attaining a depth of 100 feet, with but few levels or crosscuts; yet this small amount of development work has exposed bodies of rich ore sufficiently large and permanent in character to justify the erection of reduction works. There are hundreds of good prospects now being worked which will develop into large producing mines, and there are thousands of locations awaiting capital to develop them. It is a big country that will produce its millions of precious metals. Ellensburg is the nearest point from which to reach Salmon river and the mines, and by means of rapid stage, express and steamboat transportation the coming spring, this city, which already has a large trade with that country, can quadruple it and secure the lion's share of travel as well. The Ellensburg, Big Bend & Salmon River Transportation Co., with a capital of \$100,000, can accomplish great results this spring, and while benefiting the rich country to the north and east, can also greatly benefit Ellensburg and the cities of Puget Sound, which have hardly awakened to the magnitude of the country tributary to them. Seattle and Tacoma are live cities, it is true, but they are apparently ignorant of the resources of Central Washington.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

### Rock Breaker.

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.  
Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh. Our dry mills are the most economical ever built, and are extensively used with record of several years.

### FRISBEE-LUCOP MILL COMPANY,

GIDEON FRISBEE, Manager, 461 Howard St., San Francisco.  
HOOKER & LAWRENCE, Gen'l Ag'ts, 145 Broadway, New York.

## ENGINES and BOILERS

FROM 2 TO 100 H. P., ALWAYS IN STOCK

MILL SUPPLIES AND LUBRICATING OILS.

This cut represents our  
**IMPROVED  
HYDRAULIC  
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

Send for Circulars and Price List

HOSKIN & CO., Marysville, Cal.

## IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the **IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS**, with leve attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the **single-jointed Giants**.

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

JOSHUA HENDY MACHINE WORKS,

39 to 51 Fremont St., San Francisco, Cal.

## HOISTING ENGINES FOR MINES.

1, 2, or 4 Drums, with Reversible Link Motion or Pat. Improved Friction.

MADE ONLY BY THE

LIDGERWOOD M'FG COMPANY,  
96 Liberty St., New York.

PACIFIC COAST AGENTS,

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

JAMES LEFFEL & CO., Springfield, Ohio, or 110 Liberty St., New York.

FRASER & CHALMERS, General Agents, Chicago, Ill., and Denver, Col.

PARKE & LACY, General Agents, San Francisco, Cal.

## PELTON'S WATER WHEEL.

THIS WAS ONE OF THE FOUR WHEELS TESTED by the Idaho Company at Grass Valley, Cal., and gave 90 per cent., distancing all competitors. Send for Circulars and guaranteed estimates.

L. A. PELTON, Nevada City, Cal. AGENTS—PARKE & LACY, 21 and 23 Fremont Street San Francisco, Cal.

## WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day And upward.

ROOMS WITH OR WITHOUT BOARD. FREE COACH TO THE HOUSE J. POOLEY.

## A Treatise on the Horse and his Diseases

By B. J. KENDALL, M. D.

35 Fine Engravings showing the positions and actions of sick horses. Gives the cause, symptoms and best treatment of diseases. Has a table giving the doses, effects and antidotes of all the principal medicines used for the horse, and a few pages on the action and uses of medicines. Rules for telling the age of a horse, with a fine engraving showing the appearance of the teeth at each year. It is printed on fine paper and has nearly 100 pages, 7x5 inches. Price, only 25 cents, or five for \$1, on receipt of which we will send by mail to any address. DEWEY & CO., 220 Market St., S. F.

## THE GIANT POWDER COMPANY

Manufacture Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

GIANT POWDER or DYNAMITE, Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

JUDSON POWDER IMPROVED.

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

BANDMANN, NIELSEN & CO.,

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO CAL.

## THE DODGE PATENT "INDEPENDENCE"

Wood Separable or Split Pulleys POSSESS THE BEST BELT SURFACE.

—ARE THE—

Lightest, Strongest, Best Balanced and Most Convenient Pulleys made in the World. Entirely New and Original. Adapted to any Power Required.

COIN RETURNS ON ALL BULLION DEPOSITS IN 24 HOURS.

WORKING TESTS OF ORES BY ALL PROCESSES.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Metallurgy and Ores.

**SELBY SMELTING and LEAD CO.** 416 Montgomery St., San Francisco.

GOLD AND SILVER REFINERY And Assay Office.

Highest Prices Paid for Gold, Silver and Lead Ores and Sulphurets.

...MANUFACTURERS OF...  
BLUESTONE, LEAD PIPE, SHEET LEAD, SHOT, Etc., Etc.

ALSO MANUFACTURERS OF  
Standard Shot-Gun Cartridges, Under Chamberlin Patent.

## JOHN TAYLOR & CO.,

IMPORTERS AND DEALERS IN

ASSAYERS' MATERIALS, MINE AND MILL SUPPLIES,

CHEMICAL APPARATUS and CHEMICALS, DRUG GISTS' GLASSWARE and SUNDRIES, ETC.

114-118 Pine Street, - San Francisco.

We would call the attention of Assayers, Chemists Mining Companies, Milling Companies, Prospectors, etc. to our full stock of Balances, Furnaces, Muffles, Crucibles, Scorifiers, etc., including, also, a full stock of Chemicals.

Having been engaged in furnishing these supplies since the first discovery of mines on the Pacific Coast, we feel confident from our experience we can well suit the demand for these goods, both as to quality and price. Our New Illustrated Catalogue, with prices, will be sent on application.

Our Gold and Silver Tables, showing the value per ounce Troy at different degrees of fineness, and valuable tables for computation of assays in grains and grammes, will be sent free upon application. Agents for the Patent Plumbago Crucible Co., London, England. Also for E. G. DENNISTON'S Silver Plated Amalgam Plates. The plates of this well-known manufacturer are thoroughly reliable, and full weight of Silver guaranteed. Orders taken at his lowest prices.

JOHN TAYLOR & CO.

## Nevada Metallurgical Works.

NO. 23 STEVENSON STREET,

Near First and Market Streets, S. F.

C. A. LUCKHARDT, Manager. ESTABLISHED 1886

Ores worked by any Process. Ores Sampled. Assaying in all its Branches. Analyses of Ores, Minerals, Waters, etc. Working Tests (practical) Made. Plans and Specifications furnished for the most suitable Process for Working Ores. Special attention paid to Examinations Mines; Plans and Reports furnished. C. A. LUCKHARDT & CO., (Formerly Hubb & Luckhardt, Mining Engineers and Metallurgists.

J. KUSTEL. H. KUSTEL. **METALLURGICAL WORKS.** 318 Pine St. (Basement, Corner of Leidesdorff Street, - SAN FRANCISCO

Ores Sampled and Assayed, and Tests made by my Process. Assaying and Analysis of Ores, Minerals and Waters. Mines Examined and Reported on. Practical Instruction given Treating Ores by Improved processes. G. KUSTEL & CO., Mining Engineers and Metallurgists.

## GO TO American Exchange Hotel,

The above Hotel is situated in the midst of the Banking and Commercial Houses of the city, and is by far the most home-like and desirable Hotel to stop at. O.H.A.S. & WM. MONTGOMERY, Prop'rs.

## THE RUSSELL PROCESS COMP'Y.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY Room 709.

Rates \$1, \$1.25 & \$1.50 per day. Free Coach.

## Origin of Some Ancient Ditches.

EDITORS PRESS:—It appears from a recent statement in a San Bernardino paper that H. J. Stevenson, surveyor of the Palm Valley Water Co., while running a canal line south-easterly from the Agua Caliente Springs, came across what he supposed to be the remains of an ancient ditch, which he followed up for about a mile. The fact that large trees had grown up in this depression denoted for it a considerable age, the discoverer believing its origin to be pre-historic if not of antediluvian times. A little experience I once had in finds of that kind would cause me to accept this ditch theory with caution were I again to encounter that class of remains.

Returning in the summer of 1864 from Arizona, I came into California by way of the Mohave desert. Striking across and keeping along its southwestern border, I entered a long, narrow stretch of interval land known as Chicopolas valley. Traveling up this valley, which is separated from the Sahara by a low range of hills, I had the curiosity to ascend these hills in order to get a view of the country beyond. Striking along their westerly slope I noticed a singular depression, which, from its size and the regularity with which it held its course, running parallel with the longitudinal axis of the range, I concluded must be the remains of an ancient ditch. This trench, which on top varied in width from 10 to 30 feet, and in depth from 6 or 8 to 20 feet, held its course as far as could be seen.

While this seemed to be the work of human hands, and, if so, must have been intended for the conveyance of water, I could not see whence the water could have been obtained for filling it, there being no lakes or considerable streams in that section of country. Still, impressed with the idea that it must have been built for irrigating purposes, I kept a sharp lookout as I traveled up the valley for some evidence of former cultivation, but could find none. No mound, fragment of pottery or other relic tending to show that the place had ever been the abode of other than the present Indian race, could be seen. More than once during the day I ascended the hillside to see if the ditch was still there, as always I found it was.

By sundown I reached a ranch, where I tarried over night. Haunted by this ditch specter, I related to my host the discovery I had made, thinking it would be new to him, which, however, it was not. He knew all about it—knew when and how it was made—was, in fact, thoroughly posted as to its cause and genesis. "Seven or eight years ago," said he, "there occurred a very severe earthquake in this section of California. It opened a long and deep fissure in the earth, which, starting several miles to the west of this place, extended far to the southeast. Passing close by the house we are in, it shattered it badly, throwing down the upper story and killing one of the inmates, the wife of the owner. It was this rent you saw to-day and mistook for a ditch, as others have done before you." After what the man told me I abandoned this purpose I had formed of preparing for publication an article descriptive of my grand discovery and which I had fondly hoped would establish my reputation as an archaeologist.

As stated at the outset, this Chicopolas experience has taught me to go slow on the ancient ditch proposition, and had I been the finder of these Agua Caliente remains, knowing what a success the earthquake had shown itself to be as a ditch-digger, I would have been likely to attribute them to that rather than to human agency, looking about the while to see where in such excessively dry country enough water could have been obtained to fill so large a channel.

HENRY DEGRUIT.

San Francisco, Jan. 23, 1888.

## Coal Mine Explosion.

An explosion occurred in pit No. 5 of the Wellington colliery, British Columbia, on Tuesday, and sixty-eight miners were killed. The cause of the explosion has not yet been ascertained. A dense mass of smoke and dust was thrown from the shaft. Though a portion of the fanhouse had been destroyed, Manager Bryden immediately proceeded to the shaft and attention was first paid to repairing the fanhouse, which was quickly accomplished and the fan started again.

The shaft timbers were destroyed and the cages could not be used, but a pulley and rope were immediately prepared. Meanwhile the first man to come out of the pit had climbed by means of the cage wire cable through the shattered timbers to within 100 feet of the top, when a rope was lowered to him and he reached the surface in an exhausted condition. A second miner was also enabled to get by this perilous method to earth. It is reported that a third, when 50 feet from the top, loosed his hold and fell to certain death at the bottom of the shaft. Two men were then lowered as a search party and returned, stating that nothing could be heard but calls from below.

Fortunately the mine had not been fired, so danger from this source was averted. A temporary cage was made and lowered to a considerable depth, the miners reaching it by means of ladders, and at one o'clock, 103 of the 160 men in the mine had been rescued.

The explosion took place in the last level, and

in this 25 white miners were imprisoned, and fears that they were all killed were verified later, for at five o'clock all were carried to this surface dead and the work of taking out the Chinese began.

## Mining Share Market.

The fact that stocks still continue depressed and inactive does not seem to worry the mining community on the Comstock. Up there they do not pay so much attention to "stocks" as formerly, and pay more attention to mines.

The Virginia Enterprise makes the sensible statement that "so far as the business interests of our community and the welfare of our miners are concerned, things go on as well here under a depressed state of the stock market as under a booming condition of things, and so long as extensive hoards of pay ore exist in our mines, our own solidity and permanency are assured. Operators in San Francisco may contend for this or that point, and hull or bear this or that stock, but all we want here is to see the mines worked, ore taken out and the mills run.

"That this will be done for an indefinite period every assurance is given. The ore reserves in Con. Cal. and Virginia seem simply inexhaustible. Ophir bids fair to have a big slice of that business. Hale and Norcross is in every sense of the term a first-class mine. Savage has ore enough in sight to run for years. Chollar and Potosi have immense resources that can and will be made to yield a profit above expenses. Yellow Jacket, Confidence and Challenge are all first-rate paying properties and will soon forge to the front. Crown Point, Belcher and Segregated Belcher are far from exhausted properties and will soon open the eyes of speculators. Alta has plenty of good ore and a mill. The Silver City mines are all paying properties. Our milling facilities, owing to the heavy fall of snow this past winter, promise to be first class for the next 12 months, and there will be an immense amount of work done in that time. Finally, don't forget that there will be glorious opportunities to make money in stocks are long—and to lose it, too."

## Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

PAWL AND RATCHET MECHANISM.—Richard J. Ballew, Mgalia, Butte Co., assignor of one-third to Samuel Stevens and John W. Hall. No. 376,467. Dated Jan. 17, 1888. This invention relates to the class of steam-engines, and it consists of a novel connection between the piston-rod and the driving-shaft, whereby the dead center is obviated and the rotation of the shaft is continuous. The first claim of the patent is as follows: "In combination with a reciprocating piston-rod and a driving-shaft, a double-faced ratchet upon said shaft, the teeth on said faces being reversed. Oppositely-extending cranks pivoted upon the shaft and carrying pawls for engaging oppositely each face of the ratchet mechanism for moving said pawls so as to throw one set into engagement with one face of the ratchet, and the other set out of engagement with this other face of the ratchet, to reverse the motion of the driving-shaft and connecting-rods between the cranks and the head of the piston-rod."

CHIMNEYS.—Benjamin F. Hentzel, S. F. No. 376,478. Dated Jan. 17, 1888. This is an improved chimney of that class which are made of terra-cotta or other pipes having an exterior casing with an air space between the two. It consists of an improved construction of the interior sections and the manner of connecting them with the joint rings so as to hold them firmly and make tight joints, and in the elastic springs attached to said joint rings, whereby the space between the chimney proper and the outer surrounding tube is maintained, together with a means for making a joint between said tube and the base or cap.

## New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco: PACIFIC LIVE STOCK CO., Jan. 19. Capital stock \$1,000,000. Directors—N. H. A. Mason, J. Leroy Nickel, J. H. Bolton, Henry Miller and Chas. Z. Merritt.

WOODBURY OIL CO., Jan. 24. Object, to deal in oils, varnishes, and lubricants of all kinds. Capital stock \$100,000. Directors—Chas. J. Woodbury, Geo. J. Ainsworth, S. T. Alexander, Geo. T. Hawley, and N. W. Spaulding.

THE LOS ANGELES PAPERS announce that the "second payments" on lands bought on credit there last summer, which some correspondent of an Eastern paper predicted would knock the bottom out of the boom, have all been made, and the boom never felt the shock.

THE FIRST PAPER-MILL in the American colonies was built in 1690, by William Rittenhouse, at Germantown, Pa. Ten years later this mill was carried away by a freshet, and the stone mill erected in its stead soon after continued to manufacture paper until 1798.

## MINING SHAREHOLDERS' DIRECTORY.

## New York Metal Market.

Telegraphic advices dated Jan. 26th give the following New York prices:

BAR SILVER—90 3/4 per oz.	
BORAX—94 @ 95.	
COPPER-LAKE—\$16.40 @ 16 45.	
IRON—No. 1, \$22 00.	
LEAD—\$4 1/2 @.	
TIN—\$36.50.	

The following is the latest by mail from the "New York Metal Exchange Market Report":  
Copper—European, spot closing at \$16.90 @ 17.10. Transferable Notices (Lake) issued at \$16.90 @.

LEAD—Quiet at \$4.85 @ 4.95 spot. Transferable Notices issued at \$5.00.  
TIN—Weak at \$36.00 @ 37.10. Transferable notices issued at \$34.00.

MARBLE PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lich, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.50 @ 20.00; Grey Forge, \$17.00 @ 17.50; Hudson River, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.50 @ 20.00; Grey Forge, \$17.50 @ 18.00; Southern, Grade No. 1, \$20.00 @ 21.00; No. 2, \$19.50 @ 20.00; Grey Forge, \$17.00 @ 17.50.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$37.00 @ 37.50; Bliton Tin, \$37.00 @ 37.50; Banca Tin, \$37.00 @ 37.50; Baltimore Copper, \$14.00 @ 15.40; Orford Copper, \$15.25 @ 16.50; P. S. C. Copper, @ 16.00; Foreign Lead, \$5.40 @ 5.60; Foreign Spelter, \$6.10 @ 6.30; Antimony, \$11.75 @ 15.00.

## THE PIONEER MINERS.—The First Annual

Meeting of the Pioneer Miners' Association of California was held at rooms 37 and 39, Phelan building, last week, for the election of officers. The following-named gentlemen were elected officers for the year ensuing: Dr. I. S. Titus, president; vice-presidents—J. C. Broderick, C. P. Rutherford and W. T. Gibbs; J. G. Lawton, secretary; J. L. Halstead, treasurer; E. L. Willard, marshal; directors—J. C. Fruchey, T. C. Hoopes, S. A. West, T. R. Smith, J. Follansbee, G. E. Sherwood and I. S. Cannon. The time for holding the regular meetings for the transaction of business was changed from the first Monday to the first Thursday of each month.

THE PHOENIX Herald says: "There is no mistaking the richness of the placer diggings in the districts of La Paz and Ehrenberg, Arizona, on the Colorado river, but the scarcity of water renders the working of them almost an impossibility."

A BILL has been introduced in the Washington Territory Legislature to abolish the use of seals on legal documents.

A COOS BAY paper says ducks became so tame during the cold weather that there was no sport in shooting them.

## Sales at San Francisco

**THE FREIGHT BLOCKADE.**—Nearly 2000 freight cars are said to be blockaded on the lines of the Union and Central Pacific, and Denver & Rio Grande railroads. On Monday and Tuesday of this week about 250 freight-cars arrived here over the Central Pacific railroad, and that road is getting every engine it can obtain from other lines to move the enormous amount of merchandise which is reported to be pressing in at the farther end of the route in volume quite equal to that now discharging at San Francisco.

**ANTI-ADULTERATION.**—The National Board of Trade, at its recent conference in Washington, reaffirmed its action regarding the necessity of a judicious national anti-adulteration law. The question of spurious lard, submitted by the Chicago Board of Trade, was discussed, and a resolution was adopted petitioning Congress to enact a law providing that all packages containing impure or spurious lard shall be so plainly labeled as to avoid deception.

**TRUST ABUSES BEFORE CONGRESS.**—Mason's bill providing for the investigation of trusts and combinations was taken up by the House Committee on Manufactures Jan. 20th, and a favorable report was ordered. It is expected the report will be made early next week, and will recommend that a committee be authorized to investigate all trusts affecting coal, sugar, mining industries and other kindred subjects.

#### Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

#### Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOGAN—Santa Clara Co.  
JOHN G. H. LAMPADES—San Benito Co.  
G. W. INGALLS—Arizona Territory.  
WM. WILKINSON—San Joaquin and Stanislaus Co.'s.  
A. F. JEWETT—Tulare Co.  
E. H. SCHAEFFLE—El Dorado and Amador Co.'s.  
C. E. WILLIAMS—Yuba and Sutter Co.'s.  
R. G. HUSTON—Montana Territory.

#### Don't Fail to Write.

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to any one who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

JOHN BIDWELL has begun to make cans for packing the fruits from the Rancho Chico orchard this year. He intends to make 500,000 cans.

THERE are evidences of a mining revival in Arizona.

**WORKING ORE.**—Miners who want a quartz mill, large or small, at one-eighth the cost of stamps, should investigate the new Stiles pulverizer and concentrator, both fully tested, and which are going to get to the front and stay there. Address J. A. Johnson, 105 Stockton St., San Francisco.

**AN EASY BINDER.**—A. T. Dewey's Patent Elastic Binder, for periodicals, music and other printed sheets, is the handiest, best and cheapest of all economical and practical life binders. Newspapers are quickly placed in it and held neatly, as in a cloth-bound book. It is durable, and so simple a child can use it. Price, size of Mining and Scientific Press, Rural Press, Watchman, Fraternal Publishing Co.'s Journals, Harper's Weekly and Scientific American, 85 cents; postage 10 cents. Postpaid to subscribers of this paper, 50 cents. Send to this office for illustrated circular. Agents wanted.

**HORACE D. RANLETT,**  
Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.,  
NEWTON COPPER MINE, Amador Co.  
Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

#### QUARTZ MINES FOR SALE.

Under good hands, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

**THE H. H. H. Horse Liniment** puts new life into the Antagonized Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Burns of all characters. This H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all druggists.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 500 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorsey, 529 Commercial St., S. F.

#### 3000 Engravings for Sale.

We have 3000 or more duplicate Engravings and Electrotypes (which have appeared in this and other papers) for sale at very low prices when taken in considerable numbers. Address, DEWEY ENGRAVING CO., at the office of this paper.

## DEWEY & CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us to offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

## ATTENTION, GOLD MINERS!

WE ARE SELLING

## Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the Silver-plating, and in having much less Silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. SEND FOR CIRCULAR.

## ELECTRIC DEVELOPMENT COMPANY.

## Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trancars, Elevators, Signals and all kinds of Electrical Systems for lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

STEIGER & KERR,

JAS. W. KERR.

OCCIDENTAL FOUNDRY, 137 First St., San Francisco, Cal.

PATENT

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

JOHN TAYLOR & CO., Sole Agents, Cor. First and Mission Sts., San Francisco.

Send for Descriptive Circulars containing Testimonials of well known parties who are at present using them.

## THE ROLLER ORE FEEDER

[Patented May 28, 1892.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

**Golden State and Miners' Iron Works,**  
Sole Manufacture, 327 First Street, San Francisco, Cal.

### QUARTZ SCREENS

A speciality. Round, slot or burr slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

### Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, JR.

This now and important book is on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep places, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hardy-gurds, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

### "HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.

Experimental machinery and all kinds of metal, tin, copper and brass.

### GREAT REDUCTION!

## BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

### PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Mining and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all use.

Inventor and Manufacturer of the celebrated Slot-Cut or burr and Slot Punched Screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

**San Francisco Pioneer Screen Works,**  
21 & 223 First St., San Francisco, Cal.

### To Every Pump Maker,

Owner! Runner! Agent!

If there is ANY PRACTICAL QUESTION concerning ANY APPLICATION or ANY ADJUSTMENT of ANY KIND of a PUMP which is not answered in Mr. ROBERT GRIMSHAW'S PUMP CATECHISM,\* we would like to have it for answer in the next edition or volume.

The Author will answer any such question in our columns, if addressed in our care, by a regular mail subscriber to our paper. "Catch" questions invited, if they have a practical bearing.

\*Tells, for instance, how to put entirely together, set up, adjust, and run all the leading pumps in the market. This information can be had in no other shape or place. Price of the book, post-paid, only \$1, and worth \$5.

**DEWEY & CO.,**  
220 Market St., S. F.

# \$1,000 CHALLENGE!

PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS  
(\$575.00) F. O. B.

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1869; December 22, 1874; September 2, 1879; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

ADAMS & CARTER, Agents Frue Vanning Machine Co.,

THE FRUE ORE CONCENTRATOR  
OR VANNING MACHINE.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

THE  
"TRIUMPH" ORE CONCENTRATOR.

The present improved form of this celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE, placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Wall's Crushing Rolls.

We give on this page engravings of the "Cyclone Crusher," better known as the Wall Crushing Rolls, a device for crushing ore which is now attracting considerable attention from mining men by reason of the work it is accomplishing where in use. It is stated that the constant grinding and rubbing to which all material is subjected in being reduced by the common Cornish rolls and similar devices, and the consequent production of "slimes," is wholly avoided in this crusher. The application of a direct crushing force in this machine secures the material to any degree of fineness, producing a uniform granular pulp, which is essential to the successful treatment of ores by any process of concentration or lixiviation.

E. A. Wall, the patentee of the machine, says: "It differs from the Cornish and other roller crushers in common use, chiefly in the novel construction and arrangement of the crushing faces, which consist of series of parallel corrugations, extending across the face of the shells, either parallel or inclined to their axis, the corrugations being rounded or curved with such proportions, that when intermeshed and rotated, every portion of the surface of each will press equally upon the counterparts of the opposite roller, and being held firmly in position by suitable steel gear, skipping of the crushing faces upon each other, or upon the material being crushed, is rendered impossible.

"By reference to illustration, Fig. 2, it will be seen that the meeting or crushing faces, present at all times overlapping curved surfaces, between which the material is firmly held, and crushed by almost direct pressure, thus absolutely avoiding the 'grinding' or uneven and rapid wear of the face of the shell, and the consequent destruction of the ores by the production of refractory 'slimes,' such as result to a disastrous degree from the constant grinding or rubbing to which all material is subjected in being reduced by the common, plain-faced roll, attrition mills, and similar devices in common use.

"For pan or plate amalgamation, three pairs of these rolls will give a greater daily product than a battery of 40 stamps, requiring not to exceed one-fifth the driving power, and costing in original outlay less than one-fifth, while the cost in repair incident to unavoidable wear and tear will be but a mere fraction of the stamp battery.

"To illustrate more fully the difference in principle upon which this crusher operates, as compared with the common Cornish rolls, attrition-mills and like devices, and also to indicate the cause of the extraordinary power and durability of the machine, the fact is submitted that the crushing by this machine is the result of almost direct pressure, or, more strictly, a

direct blow, it being impossible for the ores to slip from the grasp of the machine, or for the crushing faces to slip upon themselves. The effect upon the crusher, as well as upon the ores, may appropriately be compared to the breaking of ores by hand with a hammer, as,

Fig. 2—THE WALL ROLLS.

grinding away a portion of the face of the rollers in the form of annular grooves, destroying utility as a crusher before one-fifth of the shell has been worn away.

At Silver Reef, Utah, with the sandstone ores the Wall rolls have been very successful.

Fig. 3—THE CORNISH ROLLS.

for instance, a hammer weighing four pounds, with careful usage, would probably serve to crush a hundred tons of hard quartz sufficiently fine to pass a 40-mesh screen, producing a gran-

ular pulp entirely free from refractory slimes, whereas a few hours' application of the same hammer to the face of a revolving grindstone would convert the entire hammer into a slime which would resist the most approved methods of concentration."

Fig. 1—THE CYCLONE QUARTZ CRUSHER.

Fig. 3 illustrates the application of crushing force in the common plain-faced or Cornish rolls. It will be seen that the pressure is applied at right-angles to a line drawn from the axis of the roller to the point of contact with the ore upon the periphery of the shell, or about 60 degrees from direct pressure, the inevitable result is the "grinding" of a portion of every piece of ore that passes these rollers into an impalpable slime, the ores at the same time

pass a 60-mesh, yet the finest particles are granular and absolutely free from slimes. It was found that the Wall rolls crushed five times as much ore as the Cornish rolls formerly in use, while requiring 40 per cent less steam.

The concentrating works at Milford, Utah, found the Wall rolls greatly superior to any other form of roller crushers. These rolls are also in use at the sampling works at Park City, Utah, and the sampling works at Salt Lake City, where they are giving satisfaction. Two sets have been sent to the tin concentrating plant of the Mount Eurowrie Iron Co., Barrier Ranges, New South Wales; two sets of the Barrier Ranges Concentrating Co's silver and

lead concentrator, N. S. W.; two sets to Tooth & Co., Maryborough, Queensland, for the Mount Perry gold mine. The ore in this last named mine is claimed to be of the same character as that of the celebrated Mount Morgan mine, near Rockhampton, Queensland. A set has also been purchased by the Australian Smelting and Reduction Co., Dry Creek, Adelaide, South Australia; and one by the Broken Hill Co., Broken Hill, N. S. W. There are numbers in use in Montana and Utah. Parke & Lacy are the Pacific Coast agents for this machine, and they report that the Wall rolls are being rapidly introduced in all directions in the mining regions.

## Capital in Mining.

In glancing over the mining-field of this country, it is perfectly apparent that those regions which have had the most assistance from capital of late years are the greatest producers. Take, for instance, Colorado and Montana,

which head the list now in the matter of bullion production.

They are both very prosperous from a mining point of view, and they are the two regions which have been best backed up by capital. Butte had the advantage of having very good men to give it a start, and very good mines, too, for that matter. But none of the mines were developed to any great degree until capital took hold of them. It takes money to make money in mining as in other thiogs.

Colorado, being comparatively near the Eastern centers of capital, has had great assistance, and its mines are doing wonderfully well.

Arizona, New Mexico, Oregon, Nevada, Washington and even California have not for a long time enjoyed the advent of any large capital for investments in mines. They have had to get along as best they can.

Of course in time all this will be remedied. Mining is now considered more of a legitimate business than formerly, when all mining investments were considered speculations. "Stock board" mining is in decadence in these days. People are going into

mining for the mines themselves, and it is a good thing to do, for there is plenty of room for investments of this kind.

DURING 1887 63 mining companies in the United States paid \$10,515,752 in dividends, which is a quarter of a million dollars more than was paid the previous year. The dividends paid in 1887 amount to \$2,050,084 more than were paid in 1885, and to \$1,210,029 more than were paid in 1884. The amount of dividends that will be paid in 1888 will be much greater than ever before in the history of mining in the United States. Reports in regard to the present condition of the leading mines on the Pacific Coast indicate this.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—EDS.

## Mines at Grass Valley.

## Advantage of Publishing Mining Information.

EDITORS PRESS:—There is no industry more deserving of encouragement than mining, and in view of this fact it is the duty of the local press in mining districts to devote more or less time and space to the legitimate and unexaggerated representation of all properties under development in localities where they are published. Frequently, when questioned in regard to this matter, publishers are inclined to the opinion that such action would simply be local and become in time monotonous to the readers of their paper. This idea is unjust and also ridiculous. Such articles in one sense are local, but they are not barricaded and kept within the limitations of a mineral district. They are carried from one journal to another, and in this manner are scattered broadcast over the land and never fail to come under the observation of mining men. In every mining camp properties are operated by poor men who are not able to give them that systematic development that usually brings success, or to air their operations before the world. Such men are benefited by

## Newspaper Representation

Of their mines; they appreciate the interest thus manifested in their affairs and are also encouraged by them. Districts that have been long worked are more likely to be neglected in this respect than new and booming camps, while in reality they are the very ones to encourage, particularly where merit can be found. In California, and indeed in every State and Territory in the Far West, many old but still valuable mining camps are passing out of notice, owing to the fact that no one takes sufficient interest in them to write them up.

There is no question in the world but that many promising mineral fields have been virtually ruined by inexperience and a total lack of mining ability, camps that should be prosperous and heavy bullion-producers to-day. In early days relationship was a superintendent's recommendation, and many of those who were induced at that time to enlist in mining have good reasons to regret that there was ever such a relation as nephew, son or uncle. Such failures were not only ruinous to parties directly interested, but disastrous to the section in which they were operating. Again, districts can be found that have been worked almost exclusively by miners whose only capital consisted of energy and confidence. Such districts are more frequently found in the gold belts along the Pacific Slope, and the properties only worked to a water level, or what would more naturally be termed, "surface worked."

Grass Valley is, without any doubt, one of the

## Oldest Gold-Bearing Quartz Camps

In California, and has long been noted for its heavy gold product, and also for the high grade of the precious metals extracted. This camp justly comes under the category of surface-worked mining districts, though it can boast of some of the deeper developed exclusively gold-producing quartz mines in the world. This camp affords the best illustration of the idea your correspondent desires to convey, and the past history of this fabulous gold-bearing section is only a repetition of that of other mineral districts that have passed through a long season of quietude, only to be brought to the front again as booming, dividend-paying mining fields. In early days, as was then the custom, all locations made in this district were square, and the veins having a heavy "dip" soon passed from the original location to the one adjoining, and the result was that after the original claim was worked out but little work was prosecuted in adjoining ground on account of water and the inability of miners, owing to impecuniosity, to purchase machinery requisite for draining purposes. Of course, in some instances the work of development was continued in the face of all difficulties, but these were exceptions and not the rule.

## A Large Number of Locations

Were made and universally by poor men who could continue delving as long as no capital but muscle was required; but the moment water was tapped operations were suspended never to be renewed until men of means could be induced to take hold of such properties and explore them. As a general thing all such claims were rich on the surface, and this portion of the ground was gonged and worked in any manner that would not incur a heavy expenditure, and after the surface body was extracted no effort was made by the operators to search for anything deeper in the ground. Grass Valley, though never considered at any time in its history as a worked-out camp, has passed under a cloud and witnessed for a time a steady decline, only to experience a spasmodic lease of life, and thus it exists to-day. Though the pick and drill have been employed here for more than a generation past, and acres of ground have been torn from the underground workings of the mines and millions of dollars dragged from the

rockbound coffers of the earth, Grass Valley is to-day, without any exaggeration, the

## Richest Gold Quartz District

On the Pacific Slope. The development of this great quartz-field is, comparatively speaking, only in its infancy. But very few compared with the large number of its promising prospects have ever received such development as would bring them under the classification of mines. Scientific surface-readers are not the kind of experts to judge mining districts. The hammer and drill, well backed, are the only experts on which we can safely rely. They do the work and do it satisfactorily. This is what this district requires and what it will ultimately receive. Such opportunities as are here presented to mining men may be ignored for a time, but the day will come when every one of them will be greedily sought after, and a general revival will take place all along the line. Those who have watched the ups and downs of the old camp have never lost confidence and are universal in the opinion that brighter days are in store for them.

## The Formation of the District

Is slate, and is generally considered fine breaking ground, though occasionally hard bars are encountered that retard progress, but such obstacles are not of long duration. The veins are not large, but are well defined, existing between smooth, handsome walls, and are assuredly permanent. Those who are familiar with the cost of extracting and milling the ores say that where water-power is employed, in both instances, rock yielding only \$5 per ton can be worked profitably, remarkably close work considering the size of the veins. The Idaho, North Star, Empire and other prominent mines are employing a large force of men and are all yielding well. Many other minor properties are being operated by local syndicates, all of which appear to be taking out their share of the precious stuff. Several new companies will be operating next season, and a number of transfers of property are pending. The closing down of the hydraulic mines was a severe blow to Grass Valley, as well as the mining interests of the State; but now that a reaction has taken place in quartz mining this section will be in a measure indemnified by the losses thus sustained.

## Prospecting is Going On

All over the district, and the prevailing opinion is that next season will be a very propitious one and the output of gold largely increased. Wet weather will retard for awhile the surface work on some of the properties, but this of course will be only temporary. The camp is on the line of the Nevada City Narrow Gauge railroad, in the very heart of a fine timber district, and water can be obtained on many locations for power purposes. Taken altogether, Grass Valley is most advantageously situated as a mining district, and those who are desirous of investing in gold-producing properties could not become identified with a richer or more promising mineral field. The climate, though perhaps a little rigorous, is extremely healthy, and snow never falls to a depth to interfere with teaming or other necessary outdoor work. Railroad tariff is light, and prices generally are low. Wages are three dollars per day in the mines and all other labor in proportion. The town of Grass Valley is substantially built, beautifully situated, and is a business place of some note. Religious and other public institutions are among the permanent features of the place, while a perfect, well-regulated school system is the proud boast of its people. In some future communication a more minute and explicit account of the mines will be given to your readers, coupled with the earlier history of this district, reminiscences, etc.

R. C. G.

## Los Angeles County Mines.

## San Gabriel Canyon.

EDITORS PRESS:—I have not noticed in any of your issues any reference to the mining operations now going on in the above canyon, so I herewith give you a few particulars. There is now an English company called the Victoria Mining Company, making large developments about five miles up the canyon and close to the old Zipata mines. This company commenced operations last September, and have now about 40 men employed. Already a tunnel has been run to a length of 250 feet. In this distance two large lodes of mineral have been cut through, giving exceedingly satisfactory assays varying from 67 to 191 ounces per ton. An air shaft has been sent to a depth of 50 feet, right on top of a large lode. The mineral obtained gives equally satisfactory results. This shaft is sunk with the intention of connecting with the tunnel. The water-wheel to drive the machinery is already in position.

It is intended to erect a 100-stamp mill in sections of 20 stamps. I was shown round the works by the resident engineer, W. E. Defty, a clever and courteous young Englishman, who pointed out the large outcroppings of immense width. Everything is going on in a most business-like manner, and there is every prospect of a large and successful development. The greatest surprise is that those large veins were not discovered and worked before.

It is anticipated that the mill will be in full operation within four months, although the rainy season is now somewhat stopping progress

of outside work. The operations of this company will no doubt lend a great impetus to the welfare of the district. It is to be wished every success.

Already some mining has been done up this canyon with poor results, owing to bad management. At the old Winston mine they actually cut through a large ledge of rich ore and left it behind them, although the outcroppings of this lead stand out most prominent. I am also given to understand that another English company is going to commence operations somewhere in the same canyon. T. L. K.

## Silver Creek Mining District.

EDITORS PRESS:—Situated in the heart of the Blue Mountain range in Eastern Oregon and on the headwaters of Powder and John Day's rivers, is the young and promising Silver Creek mining district. Of the mineral resources of this district little has been said or is known except by the few prospectors who are the original discoverers and explorers. The district is, in the near future, destined to become one among the leading gold and silver-producing centers of the Northwest. These few prospectors have for many years past been diligently and earnestly toiling away exploring the rivers that contain the treasure vaults of old mother earth until mines of great magnitude and richness have been exposed to view.

These prospects when discovered by the adventurous prospectors were found to be partially developed by the action of nature, leaving but little, comparatively speaking, to be done by the hand of man to prove the permanency and richness of further explorations. Now that these prospectors have discovered, explored and developed, and proven beyond a doubt the existence of strong, well-defined true fissure veins of ores containing the precious metals, they have done well their part. In fact they have done all that could be required of them. Now they await the willing hand of capital to assist them in extracting and converting the crude ore from the mine into bullion. Following is a brief description of an occasional one of the more developed of these properties, which will give to the reader a fair idea of the existing condition. Among the most thoroughly developed prospects might be mentioned the La Bellevue, Wide West, Ajax, Red Cloud, California, Imperial, Silver Star, Winchester, Grey Eagle, Silver Peak, Herculean, Excelsior, Eureka, and many others too numerous to mention, all of which have been opened up into mines of merit. The La Bellevue has been constantly worked by the Cahell Bros., who are the original discoverers. For several years from this mine nearly 150 tons of high-grade gold and silver ore has been shipped to Denver for treatment, yielding \$200 to \$330 per ton.

There is no scarcity of this ore, as the vein has been explored at various places and at considerable depth for the distance of 6000 feet, showing several chimneys of rich ore, from 50 to 250 feet in length, and 3 to 8 feet in width between walls. The largest and richest ore body yet encountered in this mine was struck only a few days ago. The La Bellevue promises to be a bonanza unequalled in the Western mining fields.

Three miles eastward from the above described mine is situated the Cable Cove group of mines. In this group are located as many as a dozen adjoining claims, which are now sufficiently developed to output immense quantities of rich gold and silver ore. Included within this group is the California mine, which has been developed by nearly 700 feet of levels, showing a continuous ore chimney, 800 feet in length, with an average width of 22 inches, the average assay value of which is \$45 per ton. This mine is capable of producing 75 tons of ore daily. Twelve tons of assorted ore, recently shipped to Denver for treatment, yielded \$107 per ton. Included in this group are several other similar mines with a considerable amount of exploring done on them. Among these may be mentioned the Herculean mine, which is a very large ledge of sulphureted quartz rich in gold. The choice of these mines described as being in the Cable Cove group can be purchased at prices ranging from \$4000 to \$20,000. I will venture to say that no better opportunity was ever offered for the investment of capital in a mining enterprise. As to facilities for working these properties and treating the ores, nothing is lacking. Forests of the choicest of timber abound everywhere, water-power is unlimited, a climate unequalled in any mountainous region, first-class roads, and everything desirable for successfully and profitably working the mines and treating the ores. As space will not admit of further description of the mines, facilities for working, etc., I will inform you further in the future. D. C. PROBASCO.

AN AMERICAN CUTLERY MANUFACTORY IN SHEFFIELD.—A singular instance of American business pluck is afforded by a St. Louis man, A. J. Jordan, who has established a large cutlery manufactory right under the nose of the most formidable rivals he could possibly have—in Sheffield, England. He declares his intention of producing wares of as fine a quality as any in the world, and is not daunted by the gloomy prophecies which are made regarding his venture. If he succeeds, it will be a notable triumph of Yankee audacity and technical skill.

## Pine Grove, Amador County.

EDITORS PRESS:—Considerable interest has been manifested in this section the past year. As it is not on the famous mother lode, it has been represented more than once as being worthless, being simply in granite, and the ledges small. Therefore, special attention was given in our visit to a number of mines. Located as it is about eight miles northeast of Jackson, it is in a part of the county abounding in timber and water, as both the Amador and McLaughlan canals pass through this section.

## Placer Mining

Is carried on to some extent, the largest claim being that owned by the McLaughlan estate, Mr. L. McLean, agent, which comprises about 500 acres. It is and has been in successful operation for some years. They employ a number of men, and though they have to buy their water to hydraulic, their cleanups are always satisfactory. Further up Grass Valley creek even richer ground is worked.

The Pine Grove placer mines are now ready for work and only stop work when short of sufficient water. All of these claims when worked systematically are satisfactory. This has been the case for the past three years or more. The mines do not come under the debris violation, as the industrious Italian catches the debris to make the richest of vegetable and garden land.

## Quartz.

The Vandermandt mine, running parallel with Grass Valley creek, is a very prosperous claim and deserves the attention of capital. The ledge is of good size. It assays as high as \$40, with eight per cent sulphurets of iron and galena, and carries some silver.

The Dane mine has been a successful mine and largely prospected. It owns a 10-stamp mill, with concentrators, which does custom work when not running on their own rock.

The Clough, formerly known as the Craft, has a large vein, carrying some free gold and a large percentage in sulphurets, it milling from \$6.50 up. It has a slate footwall with a good gouge that will pay to work.

The Manzanita, owned by Messrs. Wheeler & Bradshaw, has resumed work on the tunnel that cuts the ledge on which they will drift north-west and southeast. The tunnel is in 175 feet and strikes the ore body 80 feet below the surface. The ore mills about \$9.50.

The Climax, owned by Messrs. Reed and Askey, has, no doubt, the richest ore in the county and as rich as any in the State. A box on exhibition at the Lode fair showed jewelry quartz that would make Col. A. Andrews smile. In development a tunnel was run to cut the ledge 80 feet where the ledge is about six feet wide in granite and bird's-eye porphyry; then 130 feet south, the ore varying from two to six feet the whole distance. There are also two shafts on the ledge, 50 and 60 feet, with a drift of 150 feet in the north, from which very rich ore has been extracted.

Fully 150 tons of rock on the dump is ready for their five-stamp mill and will make a return of not less than \$23. With other prospecting this claim has been opened 900 feet and is a bonanza to own and work.

Extracting, milling, and hauling costs \$2.50, leaving a handsome result that can be increased by a mill on the ground.

Two other properties that should have the attention of persons who desire valuable investments are those owned by Eli Gardner, and formerly by San Francisco parties who became disgusted or dissatisfied in their partnership, commencing in a quarrel and ending by losing their property. The property has one shaft 260 feet with levels at the bottom. In the north drift, at about 80 feet from the shaft, the crosscut meets 22 feet in width of good milling rock, about seven feet of which is ribbon rock. There is another shaft 200 feet with drifts, and all in good shape to open with proper machinery. In a large number of pans of dirt there were very few but returned good results. The ledge can be traced for a distance in granite and porphyry. It carries a good percentage of galena and iron sulphurets which should be of high grade.

Some Italians in the same vicinity have finished crushing about 40 tons with very satisfactory results. Messrs. Ratto, Spagnoli and McKenzie Bros. have very prosperous prospects.

Besides mining, Pine Grove has its claims as

## An Agricultural Section.

The finest of fruits and in great variety is grown on the ranches of Gardner, McFarland, Griffin, M. M. Nichols, Renhart and Dan McKay. This past fall it was not unusual to see as many as 16 to 20 poles as props to keep the trees from breaking—apples, plums, peaches, prunes, cherries, berries of all kinds, grapes and even tropical fruits are grown.

The town is prettily situated and well named, the immediate population being about 150. There is a fine hotel kept by Mr. S. W. Emmons. During the summer months the town is a lively place, as the lumber and timber teams are passing all times of the day. Mr. I. T. Wheeler has a well-stocked general merchandise store where miner and logger can find supplies. There is also a good blacksmith-shop owned by Mr. I. I. Williams, who seldom has leisure even in winter.

This section should attract attention as a health resort of medium altitude, with the finest of scenery and water. INDEX.

## Calaveras County Mines.

## Murphys.

EDITORS PRESS:—The leading mines in this section are those operated by the Willard Mining Co., being galena and gray copper-bearing quartz in limestone formation. These mines have been worked by different companies for many years past, the rebellious character of the ore making their working a matter of great difficulty and expense. The present company deserve success for the outlay and persistence that have characterized their operations. Rumor has it that if the ore in the main shaft continues good to a reasonable depth, a tunnel will be driven to strike the leads at a considerable depth, and mining operations on an extensive scale will be inaugurated. On this same belt a mile further east Messrs. Stone & Moss have been quietly but energetically pushing developments on their mines. The veins average two feet in width, carrying gold and silver in a free state and in gray copper and galena. As the ores run from \$80 to \$150 a ton, they have every reason to stay by it. South of Murphys are the hydraulic mines of McCormick & Bisbee, being the old Central Hill claim. With the present low rate of mining labor, this abandoned claim is netting its owners more than it did its first locators in the fifties. West of the town the hills are riddled with gold-bearing quartz veins, the major portion of which have been opened to a depth of 10 to 50 feet by Murphys' most persistent and deserving prospector, Sublett. All of these locations could be tapped at a depth of 500 feet by a tunnel, and in consequence offer a field for capital seldom equaled, as the leads all show gold and are seldom more than 50 feet apart, with the rock running \$5 to \$15 a ton on the surface. At present Cory & Matheson are driving a tunnel to strike the Beatrice—a four-foot ledge, and will get in by spring. This ledge was abandoned by Sublett at 50 feet in depth, but the present company at 100 feet, struck ore assaying in the hundreds. Further west on the same lead, Sublett is driving a tunnel for capitalists, and will undoubtedly show up a valuable property. All this section wants is to be bottomed. All of the prospecting heretofore has been superficial in its character, and in consequence, unsatisfactory in results. Southeast lies the old placer town of

## Douglas Flat.

The bottoms and sidehills have been given up to agriculture, but the old miners stick to their old channels with a zeal worthy of success. To the east, Shannon has opened up a fine-looking lead of pay gravel, while west, Allen Thomas has reached the channel in his long tunnel and has every prospect of being well paid for his years of toil. Pray and Chase are working into the hill in the face of great difficulties; but should they combine with the Central Hill Co. will yet have a most valuable property. At Vallecito but little is being done. Capitalists have endeavored from time to time to secure the gravel deposits extending from this point to Murphys and tap bedrock by a tunnel; but the dog in the manger policy of some of the owners has thus far prevented it. Once this project is carried out, a property will be shown having few equals in the State, as the deposit is deep, several miles in length and rich in pay.

## Angala.

This town has passed the prospecting stage and entered into a permanent prosperous era. The ore bodies, at a depth of 200 feet, show both size and value. In consequence, this once abandoned camp is dotted over with new mills, all producing, and by their number supplying the extensive chlorination works of Messrs. Bland & Greyson, at this place, with a steady supply of concentrated sulphurets rich in gold. No camp in the county is as far advanced or safely anchored in quartz mining as Angala.

## Indian Creek.

North of Murphys, is enjoying a healthy mining experience. The Emmeralda is showing up very rich and other localities in the immediate vicinity promise equally well. Cunliff & Diver are working along steadily on their mines, proving their character and netting a good return for themselves. The mines of Mr. James Taylor in this vicinity are idle for want of capital, but will well repay the developer. On the north is the old Calaveras mine now under bond to Messrs. Haggin & Hearst. Their operations here are but a duplicate of everything they undertake. The Burleighs are boring away for the 500-foot level, while each 100 feet has its levels being driven; if it is a mine they will know it beyond a doubt, and once the fact is proven the Calaveras will be put in condition to be worked for all there is in it. The fact that the ore of this mine was rich from the surface and that Haggin & Hearst upon Mr. Hearst's examination are putting in a year's solid work on it, goes far to assure its being in the near future a good property. On the Stanislaus river, east of Murphys, Tom Goodwin (Genial Tom) is showing what luck and capital will do. All of the mines were abandoned or closed down in this section, the miners fearing to spoil them by further prospecting. Goodwin with his pluck and luck has by a small amount of work proved these veins to be both permanent and valuable, and his prospects look very flattering.

## Sheep Ranch.

This town is the child of the Sheep Ranch mine, owned by Mr. J. B. Haggis. Under the efficient superintendency of that practical

miner, Mr. W. H. Clary, the property has paid steadily year after year. The main shaft has just been retimbered and everything points to a still greater degree of success. As the shaft is now on its way to the 1100 foot level, there can be no doubt as to the permanency of the leads in this section.

## El Dorado.

Everything is quiet in quartz here, though one man has a number of fine prospects in the neighborhood which he proposes to develop. Railroad Flat is flat. The hydraulic claims are enjoined, and in quartz there is but little doing.

## West Point.

A new life has been infused into this old camp, which promises to outlive in size and permanency its former prosperity. The Lockwood, with its eight foot ledge of \$80 to \$800 rock, has forced itself upon the attention of mining men, and those that have thrown their prejudices aside and invested here have no reason to regret it. Messrs. Page, Rickett & Moore have secured a number of valuable properties which, at 200 feet, show a two-foot lead of ore running from \$40 up. The town wears an old-time aspect, with saloons predominating and a good hotel badly needed.

## Mokelumna Hill.

The principal mining operation in this section is the Tiger, owned by the Ilex Gold Mining Co., and superintended by Mr. Courties of Detroit. This English company has, through their efficient superintendent, erected a class of improvements seldom found on any mining property. The handsome residence of the superintendent, boarding-houses and dormitories for the employees are complete in every detail, and the fortunate miner can enjoy all the comforts of a first-class hotel at the cost of the ordinary kennel-like accommodations furnished by most mines. The work, however, is not confined to the surface, but for a depth of 300 feet and a length of 1200, the mine has been thoroughly prospected, and in consequence of the excellent showing, the necessary reduction works will soon be erected. The gold-bearing cement mines in this section are proving a bonanza to their fortunate owners.

## San Andrae.

The Union Gold Mining Co. is putting down its main shaft, and getting in shape to realize large returns. This—an English company—believes in doing what it undertakes thoroughly, realizing in the end much more than our dividends to-day, developments tomorrow, miners.

Taking Calaveras county as a whole, few counties offer as good a field for legitimate, practical, profitable quartz mining.

E. H. SCHAEFFLE.

## Sparta Mines, Oregon.

EDITORS PRESS:—General activity prevails in mining circles throughout this district, and the amount of ore hoisted gives confidence to those who are half inclined to doubt the existence of the rich quartz mines so numerous here. Until the past season, the only process of getting the values was by very imperfect assays, and the thousands of tons of ore worked at a profit is convincing evidence of the true value of these ores when properly treated, not only saving all the free gold, but the gold value in the sulphurets. The ten stamps at Hoggm are running day and night on good ore, and the result is very satisfactory to the owners. The 20 stamps on the Whitman at Cornucopia have shut down after a 26-days' run, showing a cleanup of \$65,480, or \$41.50 to the ton in gold. Large forces of men are at work on the Whitman and Red Jacket, and when the ore bins are full the mill will start for a 90-days' run. Al Waldran is working a force of men at the Gray Eagle, taking out a high-grade, free gold ore, which will be treated by the arrastra.

Major Wilkenson is working his Blue Gulch mine and is showing some very rich free gold ore, the gangue yielding as much as \$2.50 to the pan. Fate & Dennison are taking out very rich ore, the best being selected for shipment to Salt Lake City as soon as 20 tons are in sack.

The Sullivan mines, six miles north of Sparta, are likely to create a mining excitement at no distant day, as the report of Prof. Lewis shows 3,464,000 tons of ore in sight, and the result of 13 assays gives an average of \$17.81 to the ton, while the report says "more than 2,000,000 tons of the ore now in sight can be classed to run over \$40 to the ton in gold." The Sullivan mines are owned by parties here and in Chicago, and the company just organized with a capital of \$5,000,000 have placed 1,000,000 of its stock on the market, to be sold at 20 cents on the dollar, to secure capital to construct a 100-stamp mill, which will be run by water-power, the company owning the natural dam on Eagle creek, with an estimated 2000-horse power, situated less than half a mile from the center of the Sullivan group. The Arkansas Belle, owned by parties in Little Rock, Arkansas, is another big outcrop, and as these are smelting ores, it is believed the company will construct a smelter at an early day for the treatment of these ores. Reservoirs are being prepared and put in order for the free water, which promises to be more plentiful than for the past several years, and the owners of the many rich placers are getting ready for a big cleanup in the spring.

SILAS.

Sparta, Oregon, Jan. 10, 1888.

## A New Mining District in Montana.

[From our Correspondent, R. G. HESTON.]

The Orn Fino district in Deer Lodge county is just now attracting considerable attention, and justly, too. It is located on a direct line between the towns of Butte and Deer Lodge, and about equidistant, but will from natural causes be tributary to the latter place.

For several years more or less prospecting has been carried on here by Mose Menard, J. F. Fox, Franklin Stuart and others, but of a necessary development in this way was slow. Some two months ago Mose Menard, after investing about \$5000 in prospecting the Cottonwood, decided to incorporate it and let some of his neighbors in if it were a good thing, and if not, to let them bear part of the burden. This was done and a portion of the stock was laid aside for the payment of Menard for his claim, and a portion was floated for the purpose of development. Quite a fund for that purpose was raised. Mr. Menard had some very nice ore in his shaft, which was down 110 feet, and several crosscuts had been run, and in but a short time the whole of the stock for development was taken up by the residents of Deer Lodge and more was wanted.

Messrs. J. F. Fox and J. H. Mills at once supplied the want, and in the same manner placed the Mountain Lion on the market, and the development stock was placed within a few days. Active operations were commenced, with J. B. McMaster as a general manager for both prospects.

Cottonwood stock appreciated at once to three times its original cost, but it remained for the Mountain Lion to surprise them all.

A few days ago they out to the ledge in the tunnel and sent down some ore that was tested by Prof. Trshagen of the Montana College and H. S. Reid, and three tests went \$90, \$132 and \$787 per ton. Silver is predominant, but each assay showed gold. As a matter of fact, I presume all the stockholders in the Mountain Lion feel like prospective millionaires. The development is not extensive enough to determine the continuity of the ledge, but from the fact that it is traceable on the surface for a long distance and Messrs. Franklin & Co. have a shaft down on an extension and a tunnel run for some length on the vein and have good returns from assays made, it is certainly a promising outlook for the early opening of a lively camp.

There is quite a number of other locations near by. Messrs. Reed & Fox have the Banker lode, south of the Cottonwood mine. It is no uncommon thing for them to get 200 or 300 ounce ore. Ruby silver specimens are lying all over their dump. Nearly all the capital invested in the district is from Deer Lodge, and should it pan out in the future as it now gives fair promise to, it will lead to boom the old valley town.

Deer Lodge has been called upon to give up many of her leading citizens from time to time to build up and contribute to the prosperity of Butte and Anaconda. It is the hope of the writer that the tide may have reached the turning-point and that they may have to return the population again to the town that may be well called the educational center of Montana.

The mines are only eight miles from the Montana Union R. R. at Racetrack Station, and are located on Gospel mountain. Several gulches head up in this mountain that were placer-mined some 20 years ago. Among them were Independence and Boomerang. These, though both shallow, paid very handsomely in those times, but have long since been worked out and abandoned. With Mountain Lion shares at \$1 offered and no sellers, it shows the confidence the holders have in the outcome of their mine.

## Copper Smelting.

## Modern American Methode.

[Written for the PRESS.]

A work on copper smelting\* has recently been published which will be found a great use to mining engineers and copper miners. Copper mining in the United States has been developed along lines of progress quite widely divergent from those followed in Europe, until the treatment of copper ores here is as characteristically American as the treatment of gold ores.

No strikingly new principles of metallurgy have been developed in American copper smelting, but new and much improved methods of applying known principles have been discovered and worked out until American practice is in advance, and in some respects far in advance of the practice elsewhere, especially in application to American conditions of high cost of labor and material. And all that characterizes this advance is set forth by Dr. Peters in an unusually useful and available form.

The improvements have been made by a few able metallurgists, and among them and associated with them was Dr. Peters himself. The results of their work have heretofore been unheralded, and are here for the first time adequately presented.

No part of the treatise is taken up with geo-

\*Modern American Methods of Copper Smelting, by Edward D. Peters, M. E., M. D. Published by the Scientific Publishing Company, 37 Park Place, New York.

eral metallurgical principles such as belong to a work on general metallurgy; but it is packed full of available and helpful information, just such as a metallurgist needs when he turns to any particular branch of his profession, and much of this information applies to other branches than copper metallurgy.

Tables of costs, details of construction and manipulation and results of experience abound. In fact, the book consists of the notes of an able metallurgist, thoroughly trained in the general principles of his science and of large experience in the particular branch of which he treats.

That this is precisely the case the writer can state confidently, for on one occasion when it became necessary for him to learn the bearing of the very latest American improvements in treating copper ores upon the probable future cost of production at the great Butte copper lode, Dr. Peters, then in charge of the Parrott smelting works at Butte City, gave him all the required information out of the stores of his memory and his notes, and here in published form is almost the same presentation of the subject.

The information so liberally imparted from unpublished notes was very helpful and very warmly appreciated, and the same notes published will undoubtedly be widely and warmly welcomed and appreciated by metallurgists and others who take part in the great industry of copper production.

JAMES E. MILLS.

## Lead-Silver Smelting in Spain.

[Translated for the PRESS.]

In the *Berg und Huettenmaennische Zeitung* of 7th October is an article from the pen of A. Centner descriptive of the plant and operations of the "Compania Metalurgica," near Carthagena, from which the following is taken:

The greater part of the ore treated at these works is brought in by cart from the Fuensanta mine, the average monthly output being about 531 tons of galena, carrying 60 per cent lead and 21½ ounces silver per ton (2000 pounds). The gangue is quartzose and the lead contained in the ore is associated with arsenic and antimony. Fahlerz carrying 40 per cent lead and 54½ ounces silver is also received at the works from the Coto Fortuna, and other ores with from 40 to 50 per cent lead and from 9 to 145½ ounces silver per ton are brought in by water from the Sierra Almagrera. Spathe iron poor in silver brought from Parazuelos and the neighborhood of Carthagena is used for fluxing purposes. The fuel used comes from England. Most of these ores are cained before being sent to the blast furnaces, only a small proportion, those rich in silver and poor in lead, being charged in the raw state in small quantities. The lump ore is ground in a pulverizer before roasting.

The preparatory roasting is carried on in long, one-hearth reverberatory furnaces (fortebau-felungsoefen). Although the company have six of these, only three or four are in operation at the same time, the others being either held in reserve or undergoing repairs.

These calciners are 49' 3" long and 11' 5" broad, external measurements, and eight men put through about 7½ tons of ore in 24 hours, using 1½ tons of coal.

These calciners stand campaigns of from two to four months. The smelting plants proper consist of two round water-jacketed furnaces; height 10' 9"; width at tuyeres 4' 11", and eight tuyeres each. Only one of these furnaces is in use.

The smelting charge is made up as follows:

	Per cent
Roasted ore .....	33
Iron ore (30-40 per cent Fe) .....	12
Iron slag .....	6
Lead slag .....	38
Lime rock (carries some lead and silver) .....	6
Total .....	100

In addition to the above a little rich silver ore poor in lead is charged in amounts conforming with the supply on hand. The charge is made up so that the least bullion shall contain something over 64 ounces per ton in order to time the London market.

Five men are employed around each furnace, one of whom attends to the charging while the other four perform all the remainder of the work. The shifts are 12 hours.

About 15.43 tons of lead bullion are produced every 24 hours with a consumption of 6.6 tons of coke. The bullion is tapped from the crucible every five hours, while the slag runs continuously and carries from one-half to two per cent of lead. The bullion is shipped to London and sold as such.

A hydraulic lift built in between the two furnaces is employed to elevate charges to the feed floor. Two force pumps supply the necessary water pressure for the accumulator of this lift.

Blast is supplied by Root blowers. Two boilers each with two flues and a heating surface of from 969 to 1076 square feet supply the steam-power with a consumption of 1.06 tons of coal each in 24 hours. Only one boiler is used, the other serving as a reserve. Two engines, one of 60-horse power, the other of 30, furnish the motive power. The smaller is only occasionally used to run the pulverizer.

Two pumps raise the necessary water supply for water jackets, condensers, boiler, etc., into a masonry reservoir.

W. L. AUSTIN.

Toston, Montana, Jan., 1888.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**AMADOR.**—*Ledger*, Jan. 28: Sinking of the large shaft at the Amador gold mine has been suspended for the lack of large square timbers. It is not probable that these can be had before spring; or at any rate until the roads admit of their being hauled from the mountains. There are plenty cut, we understand, but they cannot be hauled until dry weather comes. Fifteen men have been discharged on this account. There are only 8 or 10 men now employed about the mine. The sinking operations at the Zelle have been finished, and the full force of miners are again at work. The shaft was sunk to feet deeper—only two sets instead of four as it was removed. The mill has been overhauled during the spell of idleness, and is now pounding away at its wonted gait again. It has been definitely decided to put up a 50-stamp mill at the New London mine in the spring. There is some talk of the Moore mill being started up at an early date, to clean up the ore piles on the dump and at the mill. It is reported that a 20-stamp mill is to be erected on the Chicago mine, near Plymouth. The two-stamp mill at the Live Oak,  $2\frac{1}{2}$  miles west of Jackson, is at work on ore from the new shaft.

**PLYMOUTH.**—*Cor. Amador Dispatch*, Jan. 28: The Plymouth Consolidated mine has a fire in some of the lower levels that, it is feared, will do considerable damage. We hear that all the shafts at the mine are covered up close with dirt to smother out the fire. The men were taken out of the mines shortly after noon to-day, 24th, and it may be as much as a month before the fire is put out, just owing to how much start the fire has got in the timbers. The New Chicago is running night and day. They are taking out a lot of good rock, and will start a mill in a short time. The mine is being sunk at a rapid rate, and it will not be long before the 1000-foot level will be started. The superintendent feels very sanguine of developing one of the best mines on the mother lode. Mr. H. P. Gordon is very busy running his tunnel to strike the lead on his claim on Indian creek, north of town. Geo. Lamb and Wickum are busy on their claim, the War Eagle, and have discovered a very fine ledge of quartz that they say will pay well.

#### Calaveras.

**MURPHYS.**—*Cor. Angels Record*, Jan. 26: The last few days of thawing weather have cleaned the flume of ice, and plenty of water for all purposes is coursing through it, starting along its journey mine and mill and gravel claims; and it is to be hoped that the mining industry will not suffer from another cold snap during the winter, thus insuring a long and we hope successful run in all mining industries. The depth of snow in the mountains, which fell early in the winter, will insure a large water supply during the heated months of summer, when mines can be more advantageously worked. Milling and mining will be in active operation here during the middle of the present week, with better prospects of remunerative returns than usual.

**SHUT DOWN.**—The Calaveras mine, at Indian creek, has shut down.

**RESUMED.**—Work was resumed in the Utica mine last Saturday, having lain idle a week, owing to the recent cold weather.

#### El Dorado.

**SUPERIOR.**—*Placerville Democrat*, Jan. 27: The Superior, or old Reid mine, located about three miles from this city, and owned and operated by Dickerhoff & Goyan, will hereafter be run by water-power. Albert Jones having completed his contract for the necessary 5000 feet of pipe. The main shaft has been sunk to a depth of 200 feet, which is tapped by the upper tunnel at a depth of something over 150 feet. The new hoisting machinery will be set up in this tunnel, and the ore taken out through the shaft, it being a much cheaper process than the one heretofore adopted of hauling the ore to the mill from the mouth of the lower tunnel. Just as soon as the pipes can be laid and water turned on, a full force of men will be put to work, and this valuable property worked for all there is in it.

#### Inyo.

**LOOKOUT MINES.**—*Independent*, Jan. 28: Fitzgerald & Gunn have leased the Minietta mine to Clinton & McGovern for a term of six months. The lessees have already opened up a fine body of ore in what is known as the Coburn cut in the mine. They will soon be included in the list of shippers. They have five men employed. That portion of the Hearst mine known as the 300-foot ore body, in the main tunnel, has been leased by Fitzgerald to John Curran. Fitzgerald has leased the Lava Beds mine to Frank Cox for five months. Cox is working three men besides himself in the mine. On the first Monday of the present month Fitzgerald began sinking on one of his claims called the Kentuck. Eight days afterward the men were taking out two tons of ore each day. Three eight-hour shifts are now working, and with but two men on each shift the yield is three and a half tons daily. The average value of the ore is 88 ounces silver per ton and 58 per cent lead. A patent hoisting windlass is being put up and a track laid for the ore cars; when these improvements are completed the ore shipments will average about 20 tons each week. The Kentuck is in a very rough country; it cost Mr. Fitzgerald \$470 to make a trail 890 feet long to the mouth of the shaft. All the indications are favorable for finding a big ore body in the Kentuck mine.

#### Nevada.

**DEER CREEK.**—*Nevada Herald*, Jan. 24: The Champion mine is in working order now with brand-new hoisting works and mill, and everything in apple-pie order. The power is supplied by two Pelton water wheels. Geo. G. Allan furnished the company with a model ten-stamp mill and appliances, and it has been so provided that five more stamps can at any time be added. Jay Parsons superintended the putting in of the hoisting works and contractor Onstoft the mill—both first-class mechanics. Mr. John Vincent is the superintendent. John O'Donnel and George Allen are at the helm in the hoisting works. John McLaughlin is foreman. With this force and a good hoisting and milling outfit, the Champion ought to make a good showing.

They now have 150 tons of ore on the dump which is being crushed at the mill. There are 26 men in all at present employed at the mine. At the Merrifield there are 14 tributaries now at work, and the number will be increased this week. The prospects are good here. The North Merrifield has a ledge which averages five feet in width, the average yield of which is \$7 per ton. A tunnel is in 150 feet from the face, and at that point the ledge is seven feet in width, with well-defined walls which are lined with a clay gouge. There are only 30 feet of backs, however. There have been mined about 1500 tons of rock. Last year Mr. McCoy, the owner, selected rock from a portion of the ledge three feet in width, for a crushing, which yielded \$18 per ton. A small quantity of rock from this ledge was taken out a few years ago which paid \$52 per ton. At present the underground work is flooded with water which cannot be handled for want of machinery. The showing is first-class here for a good and permanent mine with the investment of capital. The Spanish mine is owned by the Spanish Gold Mining Co. A. R. and A. S. Lord are the principal owners. Its area is 600 by 1500 feet, with the exception of two small pieces which were bonded to parties owning adjoining claims. The claim is on the extension of the North Merrifield—both of which are situated about one-half mile from Nevada City, near the main traveled road and a few hundred feet from the Nevada City mine. The locality is favorable for driving machinery with water-power. Both claims are on the same fissure vein as the Providence and Merrifield. There being no machinery on the Spanish mine, most of the work thus far done has been through a tunnel 230 feet in length. There is also a shaft down 76 feet and a winze down 60 feet. There has been about 1000 tons of rock taken out of the Spanish, parts of which have been worked at different mills at different times, and the average yield has been \$10 per ton. North from this point on the same ledge about 500 feet distant is another pay shoot, which was discovered last year by some Spaniards. The ore was oxidized above the water level and was evidently very rich. Before it was found out these men were working there and before they were ordered away they panned out several hundred dollars. Before leaving they caved large boulders into the hole where they were working and filled it up. Although the owners have not been able as yet to open up this point, they have done enough work to satisfy them there is a valuable deposit of ore there. The tunnel has been timbered this year and a crosscut run in the way of development. Up the creek about 600 feet east of the Mountaineer is the Julia claim. It is owned by Philip Dunn. There is a tunnel on the mine 400 feet in length, about 300 feet of which has been run the past year. The tunnel is being run to reach a pay shoot which is known to exist about 200 feet further ahead. The shoot was explored on the croppings and the rock taken out paid \$13 per ton. The ledge was 18 inches wide and the rock is heavily sulphureted. The tunnel will give about 300 feet backs when completed. The ledge runs parallel with the Mountaineer and is a very good prospect. The Chapman Ranch mine is owned by Dr. Chapman of this city. The claim is 300 feet in length and is on the same vein as the Nevada City mine. The ledge is of good size, incased on one side with a granite footwall and the hanging being slate. Parties worked the ledge some years ago and obtained very good results. It is thought mismanagement was the cause of shutting down the property. They got a mill before they arranged for works with which to pump and hoist, so when they reached water level they were up a stump and of course had to quit. The doctor has never worked the property himself, but expects to do so at no distant day, and expects to open up a good mine. The Rockdale is a claim owned by Michael Cone and is situated on Rush creek, near Red hill. A shaft is down 25 feet. The ledge is about a foot wide and pays \$8 per ton. It is a contact vein, being between slate and granite. Works are going to be put up this spring and developments made.

**RANDOLPH FLAT.**—*Foothill Tidings*, Jan. 27: The blue gravel strike in the Pet Mining Co.'s claim at Randolph Flat has caused a ripple of excitement in mining circles. Cunningham, Jenkins & Co.'s success induced the organization of the Pet Co. and the bonding from Messrs. Diamond & Eberlein of Rough and Ready of the claim in question—comprising a fraction over 21 acres. Three miners have been at work not more than a month and in that time have sunk one shaft a depth of something more than 70 feet, and in this shaft and at this depth was the gravel bed discovered. At the time of our visit the shaft was in gravel about  $2\frac{1}{2}$  feet, and the appearance of the lead bettered with every inch of depth. Before gravel was found 22 feet of cement sand was penetrated. Of course the first foot of the bed, the top if you will, is full of small boulders and good-sized rocks, but from this point on the true gravel is found. Washings of cement from the rocks and boulders were made in a primitive manner and in all cases more or less "colors" were found. Water is now retarding work and it may be three days before bedrock is attained. Then the importance of the strike can be in a measure estimated. A two-inch pump will then be put in. One of the best gravel miners on the coast is interested and working in the adjoining claim. This is John Cunningham, and he advances the opinion that the strike in the Pet will prove as rich as in his claim, where an average of over 50c is obtained to the small windlass tubful. And the gravel is washed, not crushed, as its cement character demands, that full returns may be had. Properly worked, 75c per tubful is the least value set upon the gravel. Mr. Cunningham further says the best gravel found in his claim is on the side adjoining the Pet. The gravel channel as now indicated is most advantageously located for working. A very short branch brings water from the Excelsior ditch to Cunningham & Co., and a pressure of 115 feet is obtained. One of the shafts sunk by this company is used as a pump-shaft, and on this is a four-inch pump operated by a Pelton wheel. Water for all purposes costs the company less than \$1 per day. Should the Pet Co.'s lead prove remunerative, a tunnel will be run in on it, and below the tunnel a mill will be built. This tunnel will drain the neighboring country and operations will be conducted through it. At the proposed point for the mill a water pressure of over 250 feet can be had. For systematic, economical working, unexcelled advantages are at hand. Mellich & Co. are and have been working a claim in the immediate vicinity of the above mentioned for

some time and we understand they are doing well. It is believed the old and marvelously rich Randolph Flat lead has again been found, and should these predictions prove correct that section will again witness its pristine glory and Grass Valley will take another step in the ladder of prosperity. But a short period will suffice to determine the facts.

**WORKING ORES.**—*Transcript*, Jan. 28: The reduction works on the lower road between this city and Town Talk, established in 1858 by Oscar Maltman, the present proprietor, and Mr. Deekin, have been from time to time since then improved by additions and alterations to the buildings and machinery until they are to-day the completest and most effective works of the kind on the coast. They are now to be still further improved by the addition of first-class smelting works as thoroughly equipped for treating all kinds of ores found hereabout as any on the coast. There will also be built a mill of recent invention, having a capacity of crushing 25 tons of ore a day by the dry process. There is one of the kind decided upon now in use in Calaveras county, and it is an unqualified success. The machinery for the mill will be made at Geo. G. Allan's foundry in this city. The crushing, chlorine and smelting works will when completed give employment to 18 or 20 men. Teamsters hauling freight to the upper country will on their return trips bring down loads of ores from various mines whose product cannot be made profitable without the smelting process which has not before been available without going to the expense of shipping the ores to San Francisco. The building of the new smelting and crushing works will be commenced by Mr. Maltman as soon as the winter storms are over.

**THE TRUE FIGURES.**—*North San Juan Times*, Jan. 27: We learn from an authoritative source that the cleanup at the Delhi mine for the month of December was \$24,000—\$17,000 from the mine proper and \$7000 from the sulphurets. The batteries were not cleaned. The usual dividend of \$10,000 was declared and paid. Owing to many causes there was not a full month's run. If there had been, and the batteries had been cleaned up, the company would have realized \$30,000 at least.

**THE GENERAL GRANT.**—During nearly the whole of the present month the mill connected with the above mine has been closed down for want of water to keep the stamps in motion. At the mine men have been employed the entire month getting out rock, constructing tramways and putting things in first-class order generally. As the ditches are now open and plenty of water can be had to run the machinery, the mill has been started up. Good results may be expected.

**RICH ROCK.**—The rock taken from the mining claim of Powell, Morris & Co., situated at the junction of the Middle and North Yubas, within a few miles of North San Juan, is wonderfully rich in gold and silver deposits, if the half we hear is to be believed, and we have no reason to doubt it. An ounce of the rock, so we are informed, produced silver bullion worth 20 cents. A fire test made of some of the rock indicates that it will yield in gold \$100 to the ton.

#### Placer.

**RED POINT.**—*Placer Republican*, Jan. 25: Anthony Clark has bonded the Big Channel and Peckham Hill claims at Spring Garden to the French Company of Red Point for two years. Mr. Clark will receive \$10,700 for the bond and \$20,000 more if the company purchases. The Spring Garden claim, owned by Bradley & Nash, is also bonded for \$20,000 to the same company, whose engineers are already making a survey for a tunnel.

#### Shasta.

**GOOD ORE.**—*Shasta Courier*, Jan. 25: The Durf & Gerry mine just north of town is a daisy. Four foot solid ore body and assaying up to the \$1000 notch. Durf and Deadwood Dick are lucky boys, and we are glad the tide has turned in their favor, for they are men who have often pulled hard against the down stream of not very good luck.

**UNCLE SAM.**—The Uncle Sam mine and mill, Squaw creek, was attached last week by McCormick, Saelzler & Co. and other parties for somewhere in the neighborhood of \$7000.

#### Sierra.

**BALD MOUNTAIN EXTENSION.**—*Mountain Messenger*, Jan. 28: At the annual meeting of the B. M. Ex. Co., H. T. Briggs, S. B. Davidson, H. H. Purdy, Robt. Forbes and J. W. Orer were elected directors for the ensuing year. The date of the annual meetings was changed to the third Monday in January of each year. The total gold receipts for the past year are \$122,777.60; labor expense, \$52,750.34; supplies, \$28,022.08; taxes, \$554.85; dividends, \$33,000. Supplies are laid in and paid for a year ahead, and, with 4 miles or more of the channel beyond up the Pliocene ridge, this company is assured of a prosperous future, under the able and economical management of Supt. Wm. Meikle, for whom was passed a vote of thanks. At a meeting of the board of directors, H. T. Briggs was elected President, and J. W. Orer, Secretary.

**YOUNG AMERICA.**—John Casserly came down on snow-shoes from the Young America quartz mine Sunday morning, and reported 15 stamps running. Mercury, Jan. 12th, about 7 A. M., was nine degrees below zero at the mill, over 6000 feet altitude. Average depth of snow, seven feet.

**CUPEL.**—*Mohave Miner*, Jan. 28: At Stockton Hill the Cupel mine was compelled to close down for the reason that too much water had been found in the bottom of the 100-foot shaft. Several loads of ore are now lying on the dump of this mine ready for shipment. The Prince George mine will soon be started up and large quantities of high-grade ore should be shipped during the early spring. A quantity of high-grade lead ore is now awaiting shipment on the dumps of the Star Spangled Banner. The C. O. D. mine has been compelled to lay off about 20 miners on account of the snow, teams not being able to haul ore, nor were the men able to assort ore. Now that the weather has moderated, a full force will again be put to work, and as large bodies of ore have been exposed in the 300-foot level, the output of this mine will be large for months and years to come. At Todd Basin the Oro Plata has, struck more water than can be handled by hand, and the mine will probably lie idle until spring, when fine hoisting works will be put up at the mine. It is also reported that a mill for working the ore will be built at an early day. At Layne Springs the snow blockade has been removed and a full force of men

are now at work on the Night Hawk, Alpha and Pixley. At Mineral Park the whim that had broken on the Rural has been repaired and a force of men are at work on the 165-foot level, taking out large quantities of pure silver and black sulphurets.

#### Trinity.

**NEW RIVER.**—*Cor. Trinity Journal*, Jan. 21: Clements & Ladd are working the Mountain Boomer and have about 200 tons of ore on the dump. F. Colgrove starts up the Excelsior mine this week. The Excelsior is one of the best mines in the camp and has plenty of ore in sight. Mr. Colgrove, the superintendent, deserves great credit for opening up this mine, as two years ago it was considered almost worthless. Geo. Dean, superintendent of the Ridgeway, showed me a specimen from that mine that showed free gold on all sides; the piece of quartz weighed about five pounds and is the finest ever shown in the camp. The Carrie Company are working night and day to connect the lower level with the upper so as to get air into the mine; when this is done they will commence stoping, and, as they have several hundred tons of ore in sight and a six-stamp mill ready to run, they will make things lively. Mr. Sherwood is taking out good ore which he will crush in his arastra. The Uncle Sam mine has produced considerable bullion this season, and has plenty of good ore in sight. Several other mines are showing up well and with the event of spring lively times are looked for. The season of uncertainty has passed and a feeling of security in the mines is here and has "come to stay." Every one has the fullest confidence in the future of the camp, and property here that could have been bought for a mere trifle a year ago is not for sale now at any price.

**THE SNOW-STORM LEDGE.**—*Trinity Journal*, Jan. 28: Just before the heavy snowfall of the first of this month, Krumpe, a quartz propector who worked on East Fork last fall, found a large ledge of partly decomposed quartz on the Hay Fork mountain, between Summit Creek and the foot of the mountain, in the Hay Fork mining district. The ledge is over 20 feet in width and is composed of a mixture of quartz and porphyry, about  $\frac{3}{4}$  of the vein matter being quartz. Two or three weeks ago, Mr. Jas. Trotter made three assays of ore from the ledge, and the rock went from \$8 to \$31 to the ton in free gold, besides carrying sulphurets, at least  $\frac{1}{4}$  the value of the rock being in sulphurets. The ledge was traced for some distance, but the bad weather of the past few weeks has prevented further prospecting. The location is owned by Messrs. Krumpe, Trotter, Suller and Scott.

#### Tuolumne.

**ONESTI MINE.**—*Union Democrat*, Jan. 24: Mr. M. Foot of Groveland informs us that the Kendall roller-mill is on the ground and the framework is all ready for erection. This mill is supposed to crush to tons per day of 24 hours, with four-horse power, and to ordinary fineness.

**BIG BASIN.**—A new and fine chute of ore has been discovered in the Big Basin mine. The miners had gone by it in the tunnel, as it presented small evidence of amounting to anything. However, Mr. Hamilton last week placed some men at work thereon and the work resulted in the finding of the above chute.

**EXPERIMENTAL MINE.**—This mine at Columbia is now in active operation, and the entire number of stamps, 10 in all, are doing large work. Heretofore this mine has had many disadvantages to overcome, but now it is in a fair way of producing good results. The Longfellow mine at Groveland is now being reopened by a New York company. It was never worked to any great depth, but as far as developed it gave fair results, and now after many years it has again become a gold-producer.

**THE KANAKA MINE AT GROVELAND.**—*Union Democrat*, Jan. 24: We learn that the mill on the Kanaka mine is in full and active operation, and at present the indications are very encouraging for big results. This mine is well developed with tunnels and drifts and large ore bodies in sight, and thus far the big end of the chutes is down instead of up, a fine element of future great prosperity. The aggregate length of tunnels is nearly 1200 feet. The yield of the quartz thus far crushed has been on an average \$12.50 per ton free gold and \$1.50 in sulphurets. This is a well-developed and splendid property. It is a contact lode, that is, its walls are of different formation, and the direction of the lode is northeast, and oblique across the country formation. This gentleman also has the management of some other very promising properties, but which as yet are undeveloped. There are the Young Tuolumne and Herbert Shaw mines, which by milling process have yielded \$35 and \$28 per ton. The Young Tuolumne mine is about 15 feet in width and the Herbert Shaw is about two feet in width. This spring and summer will undoubtedly witness important changes and a general prosperous condition of the Groveland community.

**SAN GUISEPPE.**—Mr. Fred Sutton is now pumping out the water from his mine, the San Guiseppe, and soon he will be ready to get out ore again and produce surprising results. The ore is submitted first to a roasting process and then treated in an arastra. The sulphurets are principally of iron, and arsenical pyrites, and even the roasting process is not entirely complete. The ore pays about \$50 per ton, although, as the desulphurizing process is incomplete, only about \$40 per ton is realized. The tailings after coming from the arastra assay well, and the gentleman intends ultimately to erect chlorination works.

**MORE STAMPS.**—Messrs. Seeber & Co. at Whisky Hill have placed six additional stamps in operation, making 15 in all, and now the entire number are running at the rate of 100 drops per minute and crushing 30 tons per day of 24 hours. The mine is about 14 feet wide, and everything is sent to the mill. The quartz is not at all refractory, and the gold amalgamates readily. Vigorous and economic management makes this mine a representative property.

**LONGFELLOW.**—*Cor. Tuolumne Independent*, Jan. 28: Col. W. C. Root of New York has bonded the Longfellow mine at this place (not Groveland, as a Sonora paper incorrectly stated last week). Machinery has been shipped from the East, and the superintendent, Mr. T. J. Quimby, has a force of men now employed starting a shaft and preparing to place the engine and pump as soon as they arrive. The Longfellow has always been considered

a good mine, having yielded largely in early days, and Col. Root stands an excellent chance of "striking it rich." There is nothing doing here at pocket or placer mining. Mr. J. T. Jackson expects to make a good cleanup on his claims south-east of here as soon as a thaw permits him to work. There is a report that Mr. J. H. Crystal has purchased the Armstrong & Co. mill at this place, and that he intends to use it in developing the Accident or some other mine in the vicinity. He bought a share in the Accident some time ago.

#### Yuba.

**RICH STRIKE AT SMARTSVILLE.**—Grass Valley Union, Feb. 1: A rich strike is reported in the Golden Gate gravel mine at Smartsville by Charles Compton & Co., who are working the ground on tribute. The prospects are as much as 25 cents to the pan, and the pay channel is both deep and wide. The tributaries have been at work since last season opening the ground, and their confidence in its value is now about to be rewarded by big cleanups. The Golden Gate claim is principally owned by Patrick Campbell, and for working it by the hydraulic process, he was so much harassed by injunctions, fines and arrests that he finally discontinued operations on the ground. He subsequently made a contract with Compton & Co. to work it by the drifting process, although that was considered a doubtful experiment by nearly all the miners of the district. If the pay channel proves as wide as it is believed, the strike is very important, as the Golden Gate embraces a large extent of ground.

#### NEVADA.

##### Como District.

**THE COMO-EUREKA.**—*Virginia Enterprise*, Jan. 24: The Symonds Bros., who last worked the Como-Eureka mine at Como, have interested a few Stockton capitalists in the mine to the extent of buying in the controlling interest in the stock and compromising with the creditors on a settlement based upon the payment of 50 per cent spot cash and the other half in the stock of the concern. This must be eminently satisfactory to the creditors, as the thing seemed hopelessly involved, and the fact that men are putting good money into the concern shows that work will surely be prosecuted and the stock made merchantable to nearly its face value, to say the least. Clayton Belknap and Colonel M. N. Stone held about a quarter interest in the mine, and they passed their holding over to these parties last Saturday on the above terms.

##### Washoe District.

**BELCHER.**—*Virginia Enterprise*, Jan. 28: Since the last report the 400 level south drift has advanced 12 feet; total length, 242 feet. The west crosscut which was started 230 feet in, is in 18 feet in low-grade quartz and porphyry. The 500 level south drift has advanced 27 feet; total distance run, 105 feet. The Sutoro tunnel drift is out 1115 feet.

**HALE AND NORCROSS.**—On the 400 level the north drift was advanced 65 feet and the south drift 60 feet. Both of these drifts are in a strong body of low-grade quartz. On the 700 level the development shows still further improvement. Work has been resumed at the top of the north upraise and raised two sets of timbers, making nine sets high, and the north drift from the top of this upraise is now advanced 55 feet, the last ten feet being in rich ore. The south upraise is now extended 80 feet above the track and continues in fine ore. Milling of the usual quantity of ore has been resumed at the Vivian mill on the Carson river.

**SAVAGE.**—On the 400 level the north drift has been advanced 19 feet and continues in ore of good grade. On the 500 level the upraise is now extended 105 feet. On the 600 level the south drift has been advanced 37 feet in fine ore. The face is in fair-grade ore. There is again sufficient water in the Carson river to run the mills, and are supplying the usual quantity of ore produced from the several levels from the 400 to the 900 stations. On the last-mentioned level, 150 feet west of the shaft, ore of good quality has been encountered since last report.

**JUSTICE.**—Are upraising to connect the 490 level with the 340, and are running drifts southeast and north. Are doing a good deal of prospecting work, and in a week or ten days will commence to extract from 20 to 25 tons of ore per day. The lack of milling facilities is sorely felt by this mine, as they have now over 1400 tons of ore on their dumps, and the mine is sufficiently explored to insure a continuous supply for a ten-stamp mill for an indefinite period.

**GOULD AND CURRY.**—On the 250 and 300 levels small drifts are being run in the old stopes. Are putting in a sill floor, chutes, etc., and expect to extract some ore during the coming week. On the 1300 level the south drift from the east drift has been extended 46 feet; total length, 190 feet. The formation is soft porphyry, with streaks of quartz.

**YELLOW JACKET.**—Extracting the usual quantity of ore and shipping the same at the 1100, 1200, 1300 and 1400 levels. The new find on the 1100 level near the Confidence line continues to improve as explorations are made and bids fair to turn out a veritable bonanza, though very little is definitely known of it yet.

**OCCIDENTAL.**—The south drift from the top of the south winze has been extended 11 feet; total length, 19 feet. Upraise No. 1 south of north incline winze has been raised up 13 feet; total raise, 62 feet. At the top of No. 2 upraise have drifted south 19 feet.

**CROWN POINT.**—The 500 level raise is now up 56 feet, and the ground is growing softer as they advance. The 600 level south drift is now out 55 feet, having made 32 feet during the week. The 500 south drift is exactly at the line of the Belcher.

**ALPHA, IMPERIAL AND EXCHEQUER.**—The work of exploration goes on in these properties with vigor. A fair prospect has been struck 25 feet east of the shaft 382 feet deep, but very little is yet known of its extent and value.

**CHOLLAR.**—Work on the incline to the Sutoro tunnel level continues, and the usual amount of ore is being extracted from the several levels, and exploring work is being vigorously prosecuted.

**UTAH.**—On the 470 level in the north drift 335 feet from the west crosscut No. 5 have advanced east crosscut No. 2, 48 feet. The formation is vein porphyry and clay, showing some water.

**SEGREGATED BELCHER.**—The south drift from

the upraise has advanced 26 feet during the week; total distance made, 86 feet. The ground consists of low-grade quartz.

**SCORPION.**—On the 300 level the north drift is advanced a total length of 74 feet and the south drift 60 feet. Both are in vein material.

**ALTA.**—The regular work and extraction of ore continues from the 1100 and 700 levels, but the mill is not yet running.

**BULLION.**—The shaft has reached the 500 level, and a station will be cut preparatory to drifting.

**ANDES.**—Are running west on the 350 in porphyry and east on the 240 level in quartz.

**BENTON.**—Drifting on the 725 level, and there is no change to report.

**POTOST.**—The stopes on the upper levels are yielding their usual quota of ore.

#### Eureka District.

**THE EUREKA CON.**—*Sentinel*, Jan. 21: The citizens of Eureka, Ruby Hill, and, in fact, the entire district, have felt greater encouragement during the week than at any time for the past two or three years. The reason for this, is that the talk about the new strike in the Eureka Con. mine is founded on fact. There is no secret about it, as no one who has expressed a desire to go into the mine has been prevented from doing so. About 250 tons of ore has been sent to the furnace since the last issue of the *Sentinel*, and it is known from those that have seen it that a drift has been run a distance of 45 feet, and a crosscut driven 20 feet, both entirely in ore, which continues on in each direction. The extent of the ore body is not yet known. The president of the company arrived here on Thursday from San Francisco, and went through the mine. On his return to town a *Sentinel* reporter interviewed him, but could get no particulars. He simply expressed satisfaction with the general outlook of the mine, and said: "It looks fully 200 per cent better than I expected." And as the new strike is situated in a part of the mine where there is room for a very large chamber of ore, its extent cannot be ascertained without further exploration.

**THE NEEDLE.**—Charles Dehman made a trial shipment of three lots of ore from the Needle mine to Salt Lake City a few weeks ago, and the returns were as follows: Lot one, 30 per cent lead, 446.30 ounces silver, and .170 ounces gold. Lot two, 20 per cent lead, 205 ounces silver, and .120 ounces gold. Lot three, 10 per cent lead, 61.60 ounces silver, and .050 ounces gold. The Needle mine is a valuable property, situated near the summit on the west side of Prospect mountain, a short distance southerly from the Grant mine.

#### Gillis District.

**THE BURNLEY.**—*Esmeralda News*, Jan. 28: The owners of the Burnley mine have struck it rich in their new shaft at the depth of 60 feet. The exact width is not yet known, but at present they have a six-inch streak of very rich rock, characteristic of the ore found in the old works. An ore shipment may be expected within a few weeks from this mine from which a big result is almost a certainty.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Jan. 27: The progress is slow in extending the crosscut east, 250-foot level. The rock continues very hard.

**NAVAJO QUEEN.**—Rock passed through in shaft this week is getting harder, and looks favorable for ore. Hope to cut the ledge in the next 50 feet.

**FOUND TREASURE.**—Drift, 150-foot level, has been extended 30 feet during the week. The ground is heavy and full of slips, which makes it necessary to timber the drift close up to the face as it advances.

**GRAND PRIZE.**—The stopes have yielded more ore than usual during the past week, and of a better grade. The mill was started last Monday; is running nicely and working the ore to a high percentage. Average battery assays \$201 per ton.

**NEVADA QUEEN.**—Crosscut to the east vein, 350-foot level, has been extended 29 feet; total, 163 feet. The face still shows seams of quartz. Have started a drift in the best portion of the vein, and will run south and connect with North Belle Isle. The ore is from four to six feet wide, and good grade.

**NAVAJO.**—South drift on west vein, 350-foot level, has been advanced 10 feet; total length, 242 feet. No. 2 crosscut from same is in 23 feet. South drift from No. 4 crosscut, east of the shaft, has been extended 11 feet; total length, 110 feet. The face is in favorable looking formation. North and south drifts from No. 1 upraise, east lateral vein, have each been extended 10 feet. In north drift the vein is small, but very high grade; in the south drift the vein is large, but low grade.

**COMMONWEALTH.**—The main shaft has been sunk and timbered 25 feet; total, 271 feet. The north drift, 100-foot level, has been advanced 11 feet. The ore continues the same high grade as heretofore, with a slight increase of water coming through the face.

**NORTH BELLE ISLE.**—North lateral gangway, 400-foot level, has been extended 150 feet. Better progress will be made in extending it the next 150 feet, at which point crosscutting can be commenced. In the face of the gangway the seams show faces of very high-grade ore, and considerable water.

#### Wild Rose District.

**PARADISE VALLEY M. Co.**—*Silver State*, Jan. 30: For the week ending January 23, 1888, ore produced and delivered to the mill, 130,500 pounds. Average assay value in ounces per ton—silver 13.11, gold 0.07. Produced 320 sacks of concentrates, 20,910 pounds, par value \$1245.88, which were shipped to the Selby Smelting & Lead Co., San Francisco, Cal. The north and south drifts on the Wild Goose vein from the west crosscut each show about 3½ feet of ore of slightly improved average value, the metal being more generally diffused through the quartz. Each drift now shows about the same quantity and value. The result of amalgamating the gold in the mills is quite satisfactory.

#### ARIZONA.

**THE HOWARD MINE.**—*Prescott Courier*, Jan. 24: Mr. Barrington, one of the owners of the Howard gold mine, drove his team into Prescott yesterday after provisions, ore sacks, etc. We met him on Montezuma street, and he freely gave us the following

information: The bottom of the shaft was, yesterday, about 33 feet below the surface. At this depth the vein is fully 12 inches thick; the ore is of a beautiful reddish-white color, honeycombed and heavily laden with small particles of gold. He had with him several specimens, and our ancient eyes beheld gold everywhere. Messrs. Hurlan and Barrington, owners of this famous property, are selling the richest pieces for "specimens," which are being sent all over the civilized world; sacking the poorest ore, and will get the gold out of it in their arrastra. They are now sinking, but may, ere long, drift on the vein. The amount taken out by them in a few days is about \$8000. Mr. Barrington further said that snow was quite deep around the mine, and that the whistle of the Standard Milling and Mining Co.'s mill on Groom creek was, for the first time, blown a couple of days ago. The Scotch Lassie mine, Turkey creek district, which belongs to our enterprising merchant, J. L. Fisher, and Mr. Dunkel, is a very rich silver property. It is well prospected by a shaft and tunnels. Its richest ore yields about 1200 ounces in silver; the poorest, 104 ounces. Average value of the ore, about 400 ounces. The richest ore vein is about 6 inches thick; a carload of the best is ready for shipment. The Oro Fino hydraulic company, Mr. Dolph, manager, commenced washing gravel a couple of days ago. Mr. D. started "the works" with 400 inches of water, which quantity is all the time increasing. He is in hopes of making a very large cleanup of gold in a short time.

**A MINER'S COMPANY.**—*Clifton Clarion*, Jan. 25: Sunday evening a meeting was held for the purpose of forming a joint mining stock company. The following mine-owners were present: A. D. McLean, Gordon McLean, J. H. Hovey, Marion Mitchell, Chas. B. Hogsett, Eugene Sherrin, Captain Ben H. Harveor and J. B. Jordan. A. D. McLean was called to preside pro tempore and P. J. Clark acted as secretary. The object of the meeting, as stated by Mr. McLean, was that the Coon mine, owned by Hovey & Co.; the Snowstorm Hovey; the Phenix and Gnat, Church and the McLean Bros.; Hardscrabble and Toughnut, Mitchell & Co., should be consolidated to constitute a group of mines, to be worked under the management of said joint stock company after organization shall have been effected. The first and foremost purpose of the company will be the erection of a five-stamp mill as soon as a sufficient amount of money is subscribed. The wagon-road to the Wonderful claim will be completed probably during the coming week. When finished the leasers will ship about 300 sacks of ore which they have on the dump. It is reported that a party of moneyed men from Silver City will shortly visit Clifton with a view of investing in a stamp-mill, providing the district will show enough ore to warrant the venture. Messrs. Campbell & Muir, who several weeks ago made a shipment of ore to San Francisco, have as yet received no returns. The delay is probably owing to the freight blockade on the Southern Pacific. The Arizona Copper Company are making a very satisfactory run from the three furnaces now in blast. They have already produced and shipped so far this month over 100,000 pounds of matte alone.

#### DAKOTA.

**GALENA SMELTER.**—*Deadwood Pioneer*, Jan. 26: For the past week or more, rumors have been afloat that three prominent mining companies, operating in Bear Butte district, were about making a proposition to directors of the Galena Smelting Co. for a lease of the plant belonging to the latter corporation. The mining companies proposing to form the combine can themselves supply sufficient ore to keep the works in constant and continuous operation for an indefinite period. Conversation with Secretary Seible, last evening, developed that while the smelting company has received no formal proposition for a lease, the subject has been broached. That his company is favorably disposed to the idea, and will therefore entertain any reasonable offer that may be made. It is not probable, however, that any contract will be entered into before the latter part of next month, and perhaps not even then; the enterprise hinging a good deal on the weather and the good or bad condition of the roads. In the event that the lease should not be made, the plant, if satisfactory arrangements can in the meanwhile be accomplished, will, however, be again blown in for custom work by the company owning it, on or about the 1st of April. The general dissatisfaction recently expressed with returns for ore shipped to Omaha will perhaps work a change of sentiment toward this home enterprise, and the former difficulty had in getting sufficient ore to make its conduct profitable, and necessitating its shutting down, thereby be obviated.

#### IDAHO.

**STRUCK THE LODE.**—*Idaho Avalanche*, Jan. 28: The Proustie Mining Company has struck the St. Johns lode with the crosscut from the Henrietta, the lode being about three feet wide of good ore, and well defined. When we say good ore, we do not mean to convey the idea that it is rich, like that in the Henrietta, but fair milling ore. This company, through its energetic superintendent, B. S. Howe, has demonstrated that the lodes at Wagon-town go down and are permanent, and more than that, the ore is rich at considerable depth. A depth of 300 feet has been attained in the Henrietta and St. Johns, which is lower by about 600 feet than the mines on the mountain above. Truly Wagon-town never presented so good an outlook as at the present time.

**BULLION.**—The Phillips & Sullivan mine turned out five large bars of bullion, valued at over \$11,400, as a result of the first run. The ore is not high grade, working only about \$32 per ton, but the vein is so large and the quartz so easily extracted that at these moderate figures there is a handsome margin of profit. The mine will now be opened up and worked systematically, when it is hoped and believed that it will keep at least one mill busy reducing ore, and pay handsomely.

**MILLER.**—We learn that the Miller mine, War Eagle mountain, is looking well, and that a rich body of ore is now in sight. Mr. Miller feels sanguine that he has a bonanza, and proposes to open it up in good shape.

**FOURTH OF JULY.**—*Ketchum Keystone*, Jan. 28: The Fourth of July mine is situated at the head of

Little Smoky, and within two miles of all the producing mines of the district. All the surface ground of the location contains two parallel lodes within its boundaries, about 150 feet apart; and designated as lodes No. 1 and No. 2. No. 1 has several cuts and shafts along the lode, showing ore in every place, and a strong lode from three to six feet wide. No. 2 is prospected by a tunnel driven on the lode a distance of 50 feet, showing a two-foot ledge of ore almost the entire length of it. The ore averages from 15 to 50 per cent lead, from 30 to 60 ounces in silver, and \$20 in gold per ton. The Fairview and Phoenix comprise two locations adjoining each other on the same lode. The exploitation work being done on this property is commenced by a tunnel on the Fairview claim running directly in on the vein. The claims are so advantageously located that as the tunnel gains in length it also gains in depth on the lode from the surface. The tunnel now being driven is constantly developing these important prospects, owing to their natural situation for easy and economical working. Reports lately received from the mine state that as the tunnel advances into the center of the hill and depth constantly gained, the quality of the ore is improving in grade and the vein increasing in width.

#### MONTANA.

**WILL SINK TO THE EIGHT HUNDRED.**—*Inter-Mountain*, Jan. 23: It has been decided by the Gagnon to sink still another 100 feet, making the total depth of the shaft 800 feet. The work will commence as soon as the station at the 700-foot level is completed (to which depth they have just finished sinking) and the drifts started. The shaft below the 600-foot level is three compartment. They will also sink 100 feet deeper on the Independent. The present depth is 200 feet. This work will commence as soon as the tank is put in at the 200-foot station to take up the water.

**A TEMPORARY SHUT-DOWN.**—Saturday evening the mines of the Chambers syndicate—the High Ore, Wake-Up-Jim, Modoc, Bell, and one or two others—were closed down and the miners laid off. The cause of the shut-down is not made public, but it is understood it was for the reason that so much ore was on hand that it was necessary to stop the output until the works at Anaconda shall reduce the supply, thus making room for further production, and that the shut-down is only temporary. The mines were never looking better nor the output so great.

**SILVER MINE SOLD.**—*Inter-Mountain*, Jan. 25: It is currently reported that Mr. Sweeney, owner of the Big Bonanza mine, west of Walkerville, has sold the same to local parties (whose names have not been learned) for \$35,000. The mine is regarded by those who are acquainted with it to be cheap at that figure. It is pretty well developed and shows plenty of ore of a fair grade, and there has been some exceptionally rich ore taken out lately. Some that has been shipped went as high as 500 ounces to the ton. The Big Bonanza was originally the Plover and was formerly owned by other parties who by making a mistake of a day in the calendar lost the property. They had made all arrangements for patenting, but let the 1st of January pass, when it became jumpable and was relocated by other parties and held by them. It promises from the present development to show that it is clearly entitled to the name which it bears.

**THE ANACONDA.**—*Review*, Jan. 26: Reports are being circulated and different stories published about what the Anaconda Co. have done, what the Chambers syndicate are doing and that the Anaconda smelter has shut down, till the poor public hardly know what to believe. The *Review* will say that the new concentrator of the Anaconda Co. has shut down, and that for reasons best known to the management. The mill was stopped last Friday afternoon. The stoppage as a matter of course is only temporary, and as the mill was stopped the Chambers syndicate mines at Butte, which furnish the silver ore for the mill, were also shut down. The outside work of the company is being pushed forward with renewed activity; the superstructure for the new smelter building is all up in place and by Saturday evening the buildings will all be inclosed. A large force of men are at work excavating for the foundation for the addition to this smelter building. There is nothing in the world that begins to approach the gigantic scale upon which these works are being constructed, and we are told they are but in their infancy.

#### NEW MEXICO.

**HORN SILVER.**—*Kingston Shaft*, Jan. 24: A fine vein of horn silver and sulphide has been struck on the Charm, adjoining the Sweepstakes by Hume. C. Dumm from Danville, North Percha, was in town 1 Thursday. He reports the North Star looking well and full of ore, but as yet mostly low grade. John W. Honsinger has uncovered ore in the drift now being run in the Leonoclast for over 40 feet. It looks like Temp' ore and assays like it, 175-ounce ore is good. Chas. D. Eckstein has been in town this week, from a long siege of work on some mining property of which he is principal owner, viz.: the Esmeralda and the Nip & Luck. These claims lie west of and adjoin the Solitaire, Homestake and Turtle, and are about four miles north of the Lady Franklin. Marble, Stillman, St. George and Call have struck water on the Silent Friend. Chris Martin has found some fine ore on the Homestake, on Mineral creek. A large amount of ore has been shipped this week from the Brushback lease; the Brandon teams took out 3½ tons at one load.

#### UTAH.

**REVIEW.**—*Salt Lake Tribune*, Jan. 28: The week has seen the break-up of the severe cold weather which prevailed such an unusual long time for this region. Still, the receiving of ore has been light. The receipts of the metals in this city for the week ending the 25th instant, inclusive, were to the value of \$80,000.78, of which \$63,130.01 was in bullion and \$16,870.77 in ore. The week previous the receipts amounted to \$208,924.92, of which \$83,418 was ore and \$125,506.92 was bullion. The product of the Ontario for the week was of bullion, 17,085.66 fine ounces; no ore sales. The Daily output for the week was six bars of bullion, 9872.71 fine ounces; no sales of ore. Fine bar receipts for the week amounted to \$26,957; base bullion, \$8500.

## MECHANICAL PROGRESS.

## Duties of a Shop Foreman.

J. T. Langdon, in the *Wood-Worker*, gives his opinion of what a shop foreman should be in the following words:

We should say in the first place that he ought to be a man of strictly temperate habits. You may say I am drawing the lines close here, but it is, nevertheless, true to the letter, and I emphasize it very emphatically. No man having charge of men or machines should ever step over the line of strictly temperate habits. Here is the base and foundation upon which they should stand solid and firm. One reason for this is, he wants a clear head at all times, no matter what the difficulty is; even if there is no trouble, he wants his head *always* level and clear.

Granted that we have got that, the next thing we want is that he should understand perfectly the mechanical part of his business. He should not only be able to do well every part of the work, but should be able intelligently to impart this knowledge to others in such a way that when he is not able to attend personally to any particular work he wants done, he will know that when he puts any of his men to work it will be done right. He should also know every part of his machine in detail, so that when any part is broken he shall be able to make a free-hand sketch of it, instead of sending the broken part to the concern that made the machine; he can send a sketch of it, which will be all that is necessary.

Sometimes, of course, a new machine is introduced into the works, and for a time he may know only the general principles of it, but just as soon as possible he should post himself up on every identical piece and know its value and use. Here is where many a foreman is lacking, and I very much doubt if there is one foreman in five throughout the country, who, if their machines were pulled to pieces and thrown into a pile promiscuously, could go to work and pick out each piece and tell what part of the machine it belonged to. A great many times from this cause, a machine may run badly, and he not knowing just where to locate the trouble, has to do as hundreds of our M. D.'s do, guess what's the matter and try a dose of this and a dose of that, till perhaps by accident he hits the right place. This is a poor way to get along. The machine doctor should be able to diagnose the case at once and apply the proper remedy then and there, without delay. Ofttimes a break-down occurs, and by a quick foresight the foreman can fix it up for the time till the hurry is over or perhaps run till shutting-down time, when the broken parts can be repaired so you can start up on time the next morning.

We should not expect everything of a foreman. He may be a good manager and understand his work to a nicety, and yet not be able to go to the forge and weld and hammer iron or make bolts or cutters, or run a lathe to turn up shafting, or fit up machinery. This is the blacksmith's part, and every concern which has its own power should have an engineer who is a practical mechanic and able to do all this kind of machine-work. A foreman's time is generally more valuable about the keeping things in order and pushing the work along than in acting the part of machinist and foreman, too. When too many iron are in the hands of them are pretty sure to get burned.

The main point is to keep things moving, and he should have the tact and energy, understanding and judgment to, as the saying is, "take the bull by the horns." It certainly is no objection to have a man who can go to the forge (and certainly no mill, however small it may be, should ever do without a forge and anvil and a few pairs of tongs) and do a good job; but, as I have remarked, it costs more than it comes to generally.

**MANUFACTURE OF ALUMINUM.**—Constant improvements are being reported in the production of aluminum whereby the cost of its manufacture has already been very much reduced. The indications are that still further improvements will be made until the metal will become so cheap that it will be made to enter into the manufacture of a vast number of household and other articles for which it is most admirably fitted. The latest improvement in the production of aluminum has recently been patented in France. The work of manufacture is divided into two parts, in the first of which 10 parts by weight of powdered alumina are mixed with four of lampblack, a sufficient quantity of tar being added to form a thick paste. This is then placed in a suitable receptacle and calcined at a red heat till the oil or tar is completely decomposed, leaving a brittle solid, which is then broken into small lumps and subjected in a closed vessel to the action of an atmosphere of carbon bisulphide, a current of which is kept constantly flowing through the vessel. On raising the temperature it is said that this agent decomposes the carboniferous mixture with the production of carbonic acid gas and a sulphide of aluminum, from which the pure metal is afterward obtained with the aid of hydrogen.

**IRREGULARITY IN MECHANICAL DEVICES.**—It has always been more or less of a puzzle, says the *American Mechanist*, to account for the reason of certain mechanical devices working satisfactorily in one locality and not in another. There is a variety of packing for

steam engines, for example, and in one part of the country one kind will be found in common use, giving excellent satisfaction, while in another place the same kind of packing will not seem to work at all. The reason is probably almost entirely one of education, not necessarily perhaps in the use of packing, but in analogous directions. In some parts of the country a certain class of machinery will be sold, and will be used with the best satisfaction. In other localities this same kind of machinery cannot be sold, or, if sold, its use will not give satisfaction. This is generally laid to prejudice, but it is more likely that education has much more to do with it. Shrewd salesmen understand this, and they understand that it is practically useless to undertake the slow process of educating people to buy what they have not already learned to like and use. They find it more profitable to sell what there is a demand for, letting the demand for something else grow up by the usual slow process.

## Blistered Boiler Plates.

Many boiler plates, which appear all right on being placed in a new boiler, are often soon found to be blistered after short use. The *Locomotive*, in alluding to this fact, says that a laminated plate only needs the application of a little heat to blister it, and this two may be considered one and the same thing. Lamination, which leads to blistering, is due to imperfect welding of the different layers of which iron plates are made up, and is never found in steel plates. The very best iron plates sometimes blister, even those made of the best material, and which have been made with the utmost care. This is due to the fact that in rolling plates, as in every other kind of work where iron has to be welded, an imperfect weld will sometimes result, in spite of any amount of care and skill. Where the lamination exists at the edge of a plate, it should always be seen during the construction of the boiler, and if of considerable extent the plate should be rejected. But unfortunately this is not always the case. The lamination is more apt to be somewhere away from the edge of the plate than anywhere else, and then its detection is difficult and in most cases impossible, until it begins to blister under the influence of heat. The treatment of a blister depends entirely upon its character and size. In the majority of cases judicious trimming at the proper time will be the only thing necessary. In other cases the lamination is so deep, and extends over so large a surface, that the entire sheet has to be removed.

**MACHINERY AND LABOR.**—Occasionally the members of one or another trade are stirred to a sense of the supposed injury that improved machinery and processes are working toward them. They claim that improvements have encroached upon their business, until they do not get as much work as formerly. Looking back 25 or 30 years, few will be inclined to dispute this, as then the day's work of this class of workmen began anywhere from four to six in the morning and continued till nine in the evening. Now they work ten hours. As to improved machinery and new means of accomplishing ends affecting the blacksmith, it is probably true that it saves him a good deal in the way of hard work and drudgery, and enables him to live much better on the product of fewer hours' work. The skilled workman will always be indispensable in almost every mechanical or manufacturing industry and in every locality. There are too many things in his trade that require the exercise of judgment and thought to allow a machine to supplant him, and it may be added that it is a difficult matter to make a satisfactory machine of a blacksmith.

**THE SHAVING PIPE.**—When the planer man has to stop about every day to clear out the shaving pipe which leads from his machine, it is a pretty good sign that something is too small. Two men and a planer stopped 10 minutes at a time to shove a pole into the shaving pipe is misapplied labor. Better get a bigger pipe. Then it would be necessary to get a larger blower, and that thought sticks right in the owner's pocket. He had half a mind to get a big one when he fitted up the shop, but he found he could save \$10 by getting this small one, so he bought it.

**JACKETING WITH EXHAUST STEAM.**—The *Railroad Gazette* points out what it assumes is a glaring defect in the design of the cylinder of stationary engines, viz., jacketing the cylinder with exhaust steam. We remember that there was a little—not much—of this practice about 20 years ago, but the error was at once pointed out, and we should be surprised to know that it was practiced by any reputable builder of the present time.

**STEEL SHIPS.**—The orders for steel ships in England are rapidly increasing and the steel-makers are anticipating a busy season in consequence. It is now considered quite certain that steel will hold the field for ship-building purposes, and iron ships will soon be as obsolete as wooden vessels.

**A PILOT ENGINE.**—Austrian engineers speak favorably of Gieszl's pilot engine for preventing railway collisions. It is worked by electricity, under the control of the engineer, and is run at any desired distance in front of the train, which it stops automatically on encountering any obstacle.

## SCIENTIFIC PROGRESS.

## The Formation of Coal.

In a paper recently read at a meeting of the Geological Society of London, by Mr. W. S. Gresley, entitled "Notes on the Formation of Coal Seams," which he says was suggested by evidence collected in Leicestershire and South Derbyshire, the author adduced evidence against the theory that coal seams were formed from vegetation growing on the spot. During an extended experience he has only once or twice detected stems passing into a bed of coal, and connected with the stigmaria roots in the underley. If, as was generally said, the stigmaria were the roots of the trees that formed the coal, such instances should be common. Not only are they rare, but the abundance of the stigmaria is extremely variable, and these roots, instead of becoming more thickly matted together in the upper part of the underley, as they should be if they were roots of the coal forests, are generally distributed throughout the clay in a manner that shows them to have been, in all probability, independent organisms.

Stigmaria roots, when found connected with a stem, are more often on the top of a coal seam than at the bottom. Other reasons assigned for rejecting the hypothesis that coal seams were formed of plants that grew upon the spot are the occasional absence of underclays, the sharp divisions between the coal seams themselves, and the beds above and below them, the distinct lamination of every seam and its division into layers of different mineral character that are persistent over large areas; the presence of similar foreign bodies in the underclay, and especially of pebbles and boulders transported from a distance; the presence of similar foreign bodies in the coal itself, and the circumstance that many coal seams are impregnated with salts, and are associated with salts containing marine fossils.

**THE OCEAN BEDS.**—Although geologists are accustomed to deal with considerable alterations of level as one of the causes operating to bring about profound changes in the topography of many regions, it has always seemed difficult to conceive that the vast depressions in the face of the earth now occupied by the oceans could ever have been subject to such tremendous changes as would be necessary to convert them into land. Many geologists, appreciating this difficulty, are inclined to believe in the general permanences during all time of the great oceanic beds, and of the continental areas. To account for the origin of the oceanic basins, Mr. Fisher, in the *Geological Magazine* proceeding from the theory of Professor Darwin, that the moon broke away from the earth more than 50,000,000 years ago, he thinks the ocean basins may be the scar left by the breaking off of the moon's mass, and that the basement rocks of the continents are fragments of the crust which had already solidified, and which were left behind.

**CHANGES IN MILK PRODUCED BY FREEZING.**—Two samples were experimented with by a Government chemist. One was frozen slowly, the other quickly, and afterward partially thawed. In the former case, the ice contained the greater part of the fat and the fluid portion most of the casein, milk-sugar and salts. In the quickly frozen and partially thawed samples, the fat was equally distributed between the solid and fluid portions. The author explains this by the fat globules rising to the top when the process of freezing is gradual. They thus become imbedded in the flakes of ice, while in quickly frozen samples this cannot take place, and the fat is more evenly distributed. If a dealer whose milk has been frozen pours off the clear fluid which underlies the ice, he is liable to the suspicion of adulteration on the one hand or will deliver milk above the standard on the other. Milk which has been frozen should be well thawed and shaken up and not sold while any ice is visible.

**INSECT REPRODUCTION.**—Perhaps no more striking illustration of the wonderful reproductive power of certain insects could be given than that contained in a work recently published by Theodore Wood, an English entomologist. It is assumed, first, that 100 aphides weigh no more, collectively, than a single grain; and, second, that only a very stout man can weigh as much as 2,000,000 grains. Then it is found that if multiplication were entirely unchecked, the tenth brood alone of the descendants of a single aphid would be equivalent, in point of actual matter, to more than 500,000,000 very stout men, or one-third of the human population of the globe, enposing each person to weigh 280 pounds.

**A GERMINATING SCIENCE.**—According to Dr. Horatio Hale, ethnology, or "the science of the races of man," will become a true science only when the tribes are grouped by the evidences of language. A scientific treatise on ethnology will commence like a treatise on chemistry, with the primary elements, which are the linguistic stocks. It will determine, as far as possible, the mother tongue and the original geographical center of each stock. It will describe the moral and intellectual traits and the physical characteristics of the people. It will ascertain their mythology, their social system, their industries and their arts. It will trace their migrations, their interminglings with other stocks and the moral and physical changes caused by

these wanderings and mixtures and by climate, soil, food, manner of life and all other influences. And finally, from ascertaining what has been, it will seek to determine what is to come and to show us something of the future which the human species, in its various divisions, may expect to attain.

**A NEW USE FOR DYNAMITE.**—*Nature* describes a new way of utilizing dynamite, lately devised by Mr. Bonnetond, a French military engineer, who uses the expansive force to drive out, for a brief period, the water from portions of wet ground in which foundations are to be made. The method is now in practice in the construction of a fortified enceinte at Lyons. A hole is first bored 10 feet or 12 feet deep, and about 1½ inches wide, in the wet ground. Into this is passed a string of cartridges or dynamite, which is then exploded. The water is thus driven far out beyond the sides of the cavity, over a yard wide, which is produced, and it does not reappear till after half an hour at least. The workmen thus have time to clear the cavity and introduce quickly setting concrete. When the water returns it cannot injure the foundation. A rapid rate of progress is realized by this method.

**THE FOUR ELEMENTS.**—The evolution of chaos into earth, air, fire and water can be represented in the following manner: In a narrow vial or glass tube, pour mercury to the height of one-fourth of its capacity; for the next fourth, add a saturated solution of subcarbonates of potash; next fourth, methylated or pure spirits of wine, tinted blue; and lastly, turpentine, tinted red. On shaking this mixture together, you will have a representation of chaos; but soon, on resting, the elements will separate themselves, and the mercury will represent earth, the blue spirit air, the red turpentine fire, and the colorless potash solution water.

**ELECTRICITY IN DELICATE WEIGHING SCALES.** M. Wurtzbourg, having noticed some incomprehensible differences in the weights of equivalent quantities, undertook investigations, which showed that balances of precision are often influenced by the electric state of the glass case which surrounds them, and this electricity influences the "riders" which slide on the beam of the balance. The error resulting from this influence may amount to 600 milligrams when the case is strongly charged, and two hours afterward there may still be an error of 10 milligrams.

**THE ELEMENTARY SUBSTANCES** now number 70. In 1837 they were 53. The size of an atom of oxygen or nitrogen is said to have a diameter of one ten-millionth part of a centimeter. They are supposed to be in a state of constant motion at the rate of 70 miles a minute, knocking against adjoining ones as much as 18,000,000 times a minute. To make them visible the present highest known magnifying power of the microscope would have to be increased nearly a thousand fold.

**SLAVE DEPENDENT INSECTS.**—The curious fact has been demonstrated by Sir John Lubbock that certain kinds of ants are unable to exist without keeping other ants as slaves, though why this is so, he has not found out. On removing the slaves from a nest of 50 slave-holding ants, he found that the latter immediately commenced to die off and were speedily reduced in numbers to six, when the slaves were returned and the mortality ceased.

**THE EARTH'S FUTURE.**—Some scientific writers predict a time when the heat of the earth will fall to a degree incompatible with organic life; others love to speak of the time when the English coal mines will be exhausted, and still others delight in figuring to show that the timber resources of the United States will be entirely exhausted in an uncertain period of time.

**THE BONES OF THE AGED.**—An English chemist has shown that the brittleness of the bones of the aged is not due, as is generally supposed, to an increase of the proportion of mineral salts with advancing years. From a section of the femur of 50 subjects of different ages no differences in the proportion of ash could be determined.

**THE TARANTULA'S ENEMY.**—The California tarantula has a deadly enemy, something like a wasp, only much larger, which attacks the monster spider whenever it sees him. Almost invariably these wasps sting the tarantula to death in a short time, and then tear the body in pieces and carry it away.

**IF THE EARTH WERE STEEL.**—and fully magnetized, its power would be about 7000 times as great as now. If the earth were of soft iron and magnetized by a sufficient amount of current, it would be about 15,000 times as strong a magnet as it is now.

**OUTWARD SWINING DOGS, ETC.**—The Wisconsin Senate has concurred in a bill to provide for the punishment of any architect, by a fine of not over \$100, who shall design any public building or factory and neglect to design outward swinging doors or fire-escapes.

**LIGHTING MINES BY ELECTRICITY.**—It has been found that mines can be lighted by electricity for one-half what it costs to light them by the old system of oil and candles. Besides, there is in electricity comparative immunity from fire.

## USEFUL INFORMATION.

## Modern Architecture.

Styles of architecture, both exterior and interior, as well as finish and decoration, are constantly changing. Architects on this coast have heretofore, as a general thing, been quite behind the times in this respect. The recent rapid increase of building in Southern California, and the advent there of many architects from various portions of the Eastern States, has introduced into Los Angeles county better and more varied styles of villa architecture than are to be found in the vicinity of either San Francisco or Oakland.

The architects of the Eastern States keep themselves more fully informed of what is going on in the way of improvement in European cities than do those of the Pacific States. To do this, however, it is necessary that competent men shall go every year to Europe to study style, finish and decoration. It is true, as a cotemporary has said, that a partial record of their improvements is furnished by the various magazines and journals, but no adequate idea of them can be obtained without personal investigation. A visitor from California in the Eastern cities is at once struck with the elegant and symmetrical simplicity of architecture, and a surprise is felt that so pleasing an effect is produced by such simple means. Just how this is done is a subject which requires much study and personal investigation.

By reference to an article under the head of "S. F. Institute of Architects" it will be seen that a new departure has recently been taken among the architects here by which the knowledge, skill and experience gained by any one member is freely thrown open for the benefit of all. The move is one in the right direction and is highly creditable to the architects on this coast, and will no doubt add much to the architectural ornamentation of San Francisco and Oakland during the boom in building upon which we are now just entering.

## Redwood Shingles.

"I desire to refer one or two questions about California redwood shingles to the readers of *Carpentry and Building*. I have seen redwood shingles that when first put on the walls and oiled looked very well, but after a few days or weeks, however, dark-colored shingles began to appear among them, and accordingly the sides of the building looked very bad indeed. I desire to inquire if there is any way by which this difficulty can be overcome."—A. W. H., Westfield.

In answer to the above, it may be stated that, to insure equality and uniformity of color, redwood shingles intended for oiling should be selected. The texture of the California production varies greatly, some being fine-grained, light-colored, soft woods, and other trees producing hard and brash kinds, down to what is known as black-heart redwood; consequently the yield in shingles from the respective classes must vary greatly as to color under treatment. Before exposure to the weather this difference is not so marked, nor even when used in ordinary roofs and painted, or the natural surface exposed to the weather. But it must be apparent that where soft, porous, and hard-grained, brashy shingles are laid indiscriminately in same connection, and oiled, the oil penetrates the one and disappears and remains on the surface of the other, producing widely different results in a little while.

Again, sappy redwood shingles should never be used, as the sappy parts have no lasting quality anywhere, and if used in shingles and oiled the sappy portions will speedily show contrast.—*Cal. Architect*.

## An Irish Invention in Glass-Blowing.

Ireland has long been famous for its whisky, and now bids fair to become as famous for its manufacture of bottles as it has hitherto been for their use as whisky conveyors. The new invention consists of a device by which compressed air regulated by machinery is made to do duty in glass-blowing, instead of air forced from human beings. It is claimed that a workman can turn out nearly three times as many bottles by the aid of this device as can be produced by the old method. The device is said to be very cheap, can be attached to the ordinary blow-pipe, and, unlike many previous attempts in the same direction, is a practical success. Glass-blowing is a very destructive work for the lungs—those who practice it seldom live much over 40 years.

The bottle industry is a very large one, the quantity produced per day in the respective countries being estimated as follows:

Great Britain and Ireland, 6206 gross; Sweden, 960; Norway, 600; Denmark, 360; Germany and Belgium, 30,039; Austria, 7000; France, 100; United States, 840; Canada, 120; Australia, 207; total, 46,432 gross.

With 300 working days this gives no less than 13,929,600 gross per year. The Germans, by means of cheaper labor and more care in producing a symmetrical bottle, absorb the great proportion of the trade at present, but this bit of Irish ingenuity may change the aspect of affairs.

**BURMESE PETROLEUM.**—Burmah has been known for ages to be rich in earth oil, and that material, raw and unrefined, has been ex-

ported in large jars or jugs thence to the ports of India long before petroleum was exported from America, but was used more for medical than other purposes by the natives. A few years ago some parties in Burmah started the business of refining petroleum on a small scale, but the enterprise has not proved growing, and their refined product must have been consumed at home, since it has not interfered with American petroleum in the least. But now that the British have annexed all Burmah, it remains to be seen whether efforts will be made to make the petroleum industry a success. That country is reported to be rich in petroleum.

**THE LONDON WOOL EXCHANGE.**—There are probably very few that have any adequate idea of the amount of business annually conducted at the London Wool Exchange. "About 1,000,000 bales of wool are sold during the year. This wool is all colonial; home produce and European wools are sold at Liverpool. The value of a year's sales is about \$100,000,000. The largest quantity of the wool comes from the Australian colonies, and it is also of the finest quality. Some idea of the industry there may be obtained when one knows that a single sheep yields about ten pounds of wool. A million bales would weigh 300,000,000 pounds, and this would take 30,000,000 sheep to produce it. The sheep are driven about the country in big droves, and they feed where they can. Sometimes, when there is a drought and the grass dries up, the farmers will pay a shilling to any one to take away a sheep and kill it. They die then by thousands. The shearing season commences in August, and the first wool of the new season's clip arrives in London in time for the November sales. Some years ago, when it was brought over in sailing ships, it did not arrive until May. The cost of freight is 2½ cents a pound. There are hundreds of vessels employed in this service alone."

**NEVADA WOOL,** it is said, commands better prices than any other clips. Justice, Bateman & Co., wool commission merchants of Philadelphia, in their circular under date of January 2d, give the following facts regarding Nevada wool: "Notwithstanding the lack of demand for other Territorial wools, the fine clips of Nevada, which are particularly suited to the present wants of manufacturers in this market, owing to their softness of finish, are inquired for to-day, and command relatively better prices than other Territorial wools. The market has been cleared of these qualities, and much more could be placed immediately at full quotations."

## GOOD HEALTH.

## Smallpox.

The picture of two Boards of Health contending for such position and advantages as may accrue from their appointment; the picture of a hospital ill adapted to the requirements of a first-class veterinary surgeon, much less of a doctor of medicine; the picture of constipated men and women crowding to the vaccination depots, must tend to excite the indignation of even the most indifferent. In the first place, a manly and courteous deference to the Governor's wishes and the public weal should obtain. In the second, a city of 300,000 inhabitants, the only seaport of large commerce on the Pacific Coast, and thus liable at any time to the introduction of zymotic disease, should have a hospital on land or water suitable in every appointment for the care of those suffering from epidemic disease. In the third, an insistence on proper vaccination within three months after birth, should the infant be in fit condition, and of revaccination within three days of all who land upon our shores from foreign countries with the view of taking up a residence among us. This latter could be done by the service of a notice on each emigrant by the ship's captain or some authorized person, which notice, unless produced with the signature of a qualified vaccinator within one week of landing, would entail a prosecution at the county's hands. Infant vaccination, as in England, could readily be made compulsory, and be easily accomplished. The extent and peculiar situation of America with regard to the influx of foreign peoples should lead our Government to take immediate and radical steps in this direction. So simple, sure and easy of accomplishment is revaccination that all objections to our proposal fade into insignificance. Surely the liberty of the citizen is not held in hand by laws preventive of such a disease as smallpox.

And now a word with regard to the precautions necessary to be observed during an epidemic such as the present. First of all, total destruction by fire of every article of clothing and of bed clothing which had been in contact with the patient, this to be followed by a thorough fumigation of the room by chlorine gas, which can be done in the following manner: In the center of the room set a vessel, containing water, which is large enough to contain another of porcelain, in which is placed one pound of chloride of lime. Having closed the windows, fireplace and all crevices, pour upon the chloride of lime half a pound of hydrochloric acid; immediately leave the room and lock the door for 24 hours. The paper should be removed from the walls; this can be done by placing in the room a boiler, and arranging it so that steam shall thoroughly fill the room

and loosen the paper. It comes off very easily when this has been done.

Should the patient not be in a fit condition for removal to a hospital, as was the melancholy case with the late Dr. Terrill, perfect isolation of patient and attendant is all that should be insisted upon. A sheet hung on the outside of the door and sprinkled occasionally with a solution of chloride of lime is to be strongly recommended, also the removal of the carpet (this applies to every sickroom) and the sprinkling of sawdust on the floor; this is easily brushed up and burned. Place the bed in the middle of the room with its back to the window; the light which is necessary for the patient's welfare can then be freely admitted without causing him annoyance. A fire should be constantly kept going for the purpose of aiding ventilation; this applies in both hot and cold weather. Smallpox, however, is more prevalent in cold spells, generally from January till June.

Are we to sacrifice the life of a patient by injudicious removal to protect those who ought to be able to protect themselves, or who rely upon the aid of efficacious ignorance? Every precaution should be taken in this early stage of the epidemic; misrepresentation of the state of the city's health only tends to treble injury in the long run. A quick, searching and intelligent method should be pursued by all. Health officers should be possessed of capacity, energy and experience. They should assist the people ably, and be assisted willingly by them in return. Confidence and courteousness should prevail, then the waving of a yellow flag would no longer be a source of aggravation, annoyance or ill-will. It behooves each and all to take warning while yet there is time—167 cases and 23 deaths for the first three weeks of the new year speak for themselves more strongly than can a few paragraphs in a newspaper.

## The Cancer Discussion.

The sad death, at the early age of 34, of Dr. Francis H. Terrill, graduate of the old and honored University of Virginia, deserves more than a passing notice in these columns. He many times expressed his conviction that the knife and fire were no cure for cancer, and was one of the few physicians interested in the effort to ascertain the truth of those claims made for the new method of treatment in this city.

A kind, courteous and skillful physician, his claims were universally acknowledged, as was evinced by a large and increasing practice. He came to San Francisco in the year 1883, previous to which he had been for five years surgeon in the American Navy. His appointment as surgeon on Colonel Dickenson's staff with the rank of Major was alone due to his gentlemanly bearing and merit. In this, as well as all other relations of life, he maintained the "honor and dignity of the profession" in the true sense of this much-heard phrase.

On being reprimanded by Dr. Plummer, secretary of the Medical Society of San Francisco, who asserted that his principles did not allow him to consult with any practitioner outside of the regular profession, Dr. Terrill answered: "My principles are those of liberality and independence in the practice of my profession." He further proceeded to inform the doctor that he had been a gentleman before entering the profession of medicine, and he was resolved to continue such while in it. Further, he declined, he said, to be dictated to by any clique or body of men, and he had some time before resigned his professorship at the Toland Medical college and membership of the society, in order to be a free man. The occasion of this reprimand was the having given much aid to, and held much confidence in, Dr. Hertzstein, an eclectic practitioner of this city. Practitioners of medicine: The words uttered by Dr. Terrill, who has been so early and so sadly taken from our midst, deserve to be engraved upon his tombstone. Let them be also your motto, and perchance you may achieve as bloodless and fair a fame as Dr. Francis Heath Terrill.

**VALUE OF HYGIENE.**—A medical professor of Munich, named Pettenkofer, has recently been advocating the necessity for more compulsory instruction in hygiene in all universities and technical schools. He insists that there are four classes of men who especially need a full knowledge of this science; they are physicians, architects, engineers and military men. As an illustration of the value of this knowledge, Prof. Pettenkofer cites some figures gathered from statistics of the Crimean and Franco-Prussian wars. In the former, he says, the proportion of French soldiers who died of wounds received at the hands of the enemy to those who died of disease was 100 to 375; while in the latter named war, 15 years later, the corresponding proportion in the German army was 100 to 43—a gain of 332 per cent. More than 70,000 German soldiers suffering from the typhoid fever and more than 30,000 prostrated with dysentery were transported across the French frontier home without any increase of the prevalence of these maladies among the country's civil population. All this the professor attributes to the advanced knowledge in hygienic laws. In London during the 17th century, when the population was only 1,000,000, the mortality rate amounted to 42 in every thousand, while now, with a population of nearly 5,000,000, the mortality only amounts to 21 for every thousand. The English people, their engineers and architects, have been studying hygiene.

## Mohave County Mines, Arizona.

**EDITORS PRESS:**—Mohave county, Arizona, has made more substantial progress, in the development of her mining resources, during the past year, than since the organization of the county. While Mohave has, for the past 15 years, been a steady producer of exceptionally high-grade ore, never, until within the last two years, have facilities been offered for the handling of comparatively low-grade ore with a profit, i. e., from \$60 to \$70 ore; and never before has the production been one-half what it was in 1887. Nearly \$1,000,000 worth of gold, silver and lead have been shipped from Kingman during the 12 months ending December 31st.

The C. O. D. mine has been converted from a mere prospect into a bonanza of wonderful richness and extent. The chloride ore, having been worked out to water level by chloriders, and the ore becoming low grade at that depth, a shaft was sunk to a depth of 300 feet, after erecting expensive hoisting works and pumping machinery. At 200 feet the ore began to improve, and has continued to do so, and also to increase in amount as depth is attained, until now there is in the bottom of the shaft and extending the entire length of the levels, over four feet of ore that works from \$350 to \$450 per ton by the carload. The Rural mine has been developed from a mere surface prospect of two or three inches of chloride ore to a bonanza two feet wide at 200 feet deep of ore averaging \$2000 per ton, and in many places the entire lead is more than half native silver. To see the glittering metal coming upon the surface reminds one of the Silver King in its palmy days.

The Juno mine has produced 500 tons of chloride ore, some of it working 700 ounces in silver per ton. The Juno belongs to a prominent merchant of San Francisco, and had lain idle for a long time until some miners obtained a lease on it, and proved it to be a good paying mine.

The Elkhart, a lead mine that was supposed to be worthless, has developed a four-foot vein of pure white carbonate and galena ore that carries gold and silver enough to net \$45 per ton, after paying shipping, hauling and smelting charges of \$35 per ton.

The Altola mine has produced several carloads of ore ranging from 100 to 125 ounces of silver and 25 per cent of copper. The Minnesota, after lying idle for 10 these many years, was leased and developed into an 18-inch vein of 600 ounce ore. The Ora Plata has been sunk 50 feet deeper, and a big body of 150-ounce ore struck below water level, but water runs the miners out, and now a pump and hoisting works are ordered.

The Night Hawk has been tapped by a tunnel below water level, and a foot of 350-ounce ore is the result. The American Flag is producing more ore, and even richer ore, than ever before, the last carload sampling 624 ounces per ton at the Pueblo works. I might keep on enumerating new strikes on old supposed worthless claims and improvements on some of the "old standbys" until it would fill many pages of the PRESS, but these few examples are enough to show something of the new life which has seized the mining men of this county and what good results are following it. When I say that, with only one or two exceptions, these new developments have all been made after passing through the base ore that underlies the chloride, and just below water level, it will be perceived what I mean by substantial development. Heretofore the miners, when they had extracted all the chloride ore from the surface, were compelled to abandon further development on account of water and the increased cost of sinking; but after some had managed to get through the iron belt at and below water level, others were encouraged to try, and in nearly every case success far beyond their most sanguine hopes has rewarded their labor and perseverance, and thus it is that old Mohave is rapidly coming to the front as a bullion-producer.

There are many other new developments in old claims within this county that are equally deserving of mention as those spoken of, but it would not be fair to intrude further upon your space.

HENRY P. EWING.

Chloride, Mohave Co., Ariz., Jan. 16, 1888.

**USE GOOD MATERIAL.**—In building machinery, no matter for what purpose or to what uses it may be applied, there is nothing in the experience of those who have devoted years to the business so prominent as their faith in the use of good material. The curse of many an establishment is to be found in what is termed "cheap" material. There is never any economy in substituting cheap for good. There is never anything gained by employing a cheap thing simply because it is cheap. For instance, never use brass when your judgment recommends gun metal. Whatever in your judgment is best, is the proper material to use.

**BUILDING TO SUIT THE FURNITURE AND CARPETS.**—In arranging the openings of a room, it is well not to forget the wall spaces. It is sometimes advisable to build a house to suit the furniture. Carpets are generally of certain uniform widths, and it would also be well when feasible to so regulate the width of the rooms as to have the carpets fit with as little waste as possible. The tenant will bless the architect who takes these matters into consideration in planning his dwelling houses.

## Passing Events.

Abundant rain has fallen all over the State, greatly to the benefit of miner and farmer. All fears of a dry season have long since passed away. There is a heavy supply of snow on the mountains, insuring a good water season.

The completion of the great Merced canal is an important event. It is 27 miles long, cost \$1,750,000, and its completion will permit the irrigation of 600,000 acres of land. The canal is 10 feet deep, 100 feet wide at top and 70 feet at bottom. The lake or reservoir covers 640 acres; average depth of 30 feet.

There is great scarcity of coal at this port, which inconveniences manufacturers and domestic consumers. Prices of all kinds of coal are very high at present, and even at the high prices only small quantities can be purchased. The fire at the Wellington mines has decreased the already low supply.

We devote considerable space this week to a general review of precious-metal mining on this coast for the year 1887. The mining industry shows marked advancement all over the coast.

The Union Iron Works have removed their down-town office from 216 Market street to the northeast corner of Mission and First streets.

A GREAT soda manufacturing enterprise is to be started at Owen's lake.

The San Francisco foundries used 13,350 tons of pig iron last year.

## MINING OPERATIONS IN 1887.

Four Decades Since the Great Marshall Gold Find in California.

It is now just 40 years since the grand discovery of gold was made at Sutter's Mill in California, that event having occurred, as now seems probable, on the 24th day of January, 1848, and not on the 19th day of that month, as has heretofore generally been supposed. This change of date, in so far as it may be said to have been effected, is due to an entry made in a diary kept by Azariah Smith, who was at work on the mill at the time gold was found by James W. Marshall, this date finding some corroboration from an entry made about the same time by Henry W. Bigler in a diary kept by him, also Bigler having been a fellow-workman with Smith on the mill. We speak of Marshall's as being the grand discovery to distinguish it from other discoveries of gold that had occurred in California long before. But the deposits previously found were unimportant, having been comparatively poor and of limited extent. The first gold found in this State was discovered in 1775 at a place now known as Carga Muchacho, 14 miles west of Fort Yuma, on the Colorado river. Fifty-three years afterward another find occurred at San Isidro, in the western part of San Diego county. In 1838 placers were struck in San Francisco canyon, in the northwestern part of Los Angeles county, and were worked in a small way for the next 10 years. These were all placer deposits, though there is a tradition that some attempts were made in the interim at working gold-bearing quartz. All the gold gathered in California prior to 1848 did not probably exceed \$200,000, and may not have reached half that amount.

Much more might, and no doubt would have been collected, had not the Catholic priests, who were well aware of the auriferous character of the country, discouraged the business of mining as being inimical to their missionary labors. That the early Spanish settlers did not explore the interior in search of gold is explained by the fact that the back country was infested by hostile Indians, nor had these settlers any reason to suppose that these interior regions were especially rich in gold.

## The Year 1887.

Though not distinguished by the occurrence of any great mineral discovery or other specially notable event, the past year has, nevertheless, been one of the most satisfactory in the history of mining on this coast. In the first place the product of bullion has been the largest ever made. On this product the profits have been fair, and but for the extremely low prices ruling throughout most of the year for copper, silver and lead, these profits would have been unusually large. The year has seen fewer financial failures and, what is almost equally gratifying, fewer illegitimate schemes perfected than any of its predecessors, and this simply because the investors in mines are observing now more discretion and business sense than formerly.

Besides such exemptions from financial loss, the year has witnessed fewer grave accidents in the mines than usual, none notably disastrous to life or property having occurred. This exemption from serious casualties has been due mainly to the greater precautions taken by employers to guard against their occurrence, and in part to a growing prudence among the miners themselves. The new year, however, opens with a very holocaust, no less than 69 miners having on January 24th lost their lives by an explosion of firedamp in the Wellington coal-pit, British Columbia. But this calamity, though painful in the extreme, can hardly be attributed to carelessness, as no one suspected the presence of the deadly gas in this pit, which was by all considered the safest in the whole group of mines. Whether or not the accident might have been guarded against remains to be demonstrated. As yet no charge of neglect has been made against the management.

Speculation in mining shares, once a potent factor of mischief, has so far subsided that it may be said to have been practically eliminated from the business, operations of this kind being now confined mostly to regular dealers in stocks and to that class of gamblers who are bound to spend their spare money in this or some other game of hazard. Much of the investment now made in mining shares is with a view to long holding rather than making a quick turn or taking chances on a fluctuating market.

As in the past, a great deal of preliminary expenditure continues to be made throughout our mining regions. Much of this preparatory work is, however, now beginning to tell on the product of bullion, as denoted by its growth during the past few years. And this gains so made, it may confidently be predicted, are destined not only to be kept up but to undergo steady and it may be very rapid enlargement in the future. To our mineral deposits there is no limit; and if we keep on opening up and outfitting new mines, and improving our machinery and methods, a corresponding increment of bullion cannot fail to ensue.

## Freedom from Labor Troubles.

Of all our great industries none have been so little disturbed by labor troubles as mining for the precious metals. Strikes, whether for shorter hours, higher wages or other cause, have been comparatively infrequent and of short duration. The wages of miners have not been much diminished for the past ten or fifteen years. Varying with locality and the kind of work to be done, miners receive now from \$2.50 to \$4 per day of ten hours. The daily wages of good drifters and most underground hands are \$3 in California and \$4 elsewhere west of the Rocky mountains, the rate being somewhat less in countries further to the east. In the deep workings on the Comstock range, where the heat is great, and generally in other places where the ground is extremely wet or the ventilation bad, the miners are not required to labor more than six or eight hours per day or on two shifts of three or four hours each. Where miners work by the day they generally board and lodge themselves. Where they engage by the month, as sometimes happens, they receive from \$50 to \$75 per month, board and lodging included. When first introduced, the miners in most localities strongly opposed the use of giant powder and the single hand drill. But this opposition was not kept up very long, nor did it cause any serious trouble while it lasted.

## Quartz Mining

Continues to be the principal branch of gold-mining practiced in California, fully 65 per cent of the gold bullion produced in the State being obtained from the auriferous ores. Great improvements have been made of late in this branch of mining, ores that only a few years since were rejected as worthless, being now worked with profit. It is probably the case that we are able to handle as low-grade ore as can be done in any other part of the world.

If so, this establishes for our machinery and methods a manifest superiority over all others, inasmuch as labor and some of the other factors of production are much dearer here than in any other country, not even Australia excepted. As regards the item of labor, it is more than twice as costly here as in most European countries. If with such high-priced labor we can utilize ore of as low, or nearly as low, grade as can be done anywhere else, then our mechanisms and processes must be a long way ahead of those in use by any other people. This conclusion seems to us inevitable.

In no country do these new helps to mining so multiply as on the Pacific Coast, and more especially here in California. Not a month passes but some novel and really useful invention claims the attention of the mining public, to say nothing of the many that are neither new nor useful. One day the candidate for popular favor is of a mechanical and the next of a metallurgical character. Now it is a labor economizing and then a money or a metal-saving device, these contrivances coming in the shape of water-wheels, engines and hoilers; roasters and smelters; rock-breakers, ore-feeders and crushers; screens, amalgamators, concentrators, aprons, riffles, plates, and other gold-savers; nozzles and sluices; pumps, machine-drills, safety-cages and air-compressors, together with an infinity of explosives, all fearfully potent, and metallurgical processes without number. While many of these inventions possess little or no merit, a large percentage are really valuable and are not long in gaining acceptance on the part of the mining community.

With so much that is helpful we find it remunerative to mine and mill auriferous quartz in California that yields a total of not more than one dollar per ton. Where this is done all the conditions are, of course, exceptionally favorable: the ore is free milling, abundant, and easily extracted; the mine and mill are

close to each other, and the machinery is driven by water-power. The bulk of the quartz worked in this State yields from eight to ten dollars per ton, while the cost of mining and milling ranges from three to five dollars per ton.

Nevada and Amador remain the leading quartz-mining counties of the State, with Sierra not far behind. In these counties the largest production has been made, and there the greatest expansion of the business has taken place during the past year. In a dozen other counties, however, a marked progress has been made in this department of mining.

## Drift Mining.

Except in California, placer mining is not now extensively practiced in any of the Pacific States or in the Territories. In Alaska 90 per cent of the gold taken out is the product of vein mining. In British Columbia, while placer is about the only kind of gold mining much pursued, it does not nor has it ever reached there large dimensions. In Arizona, Oregon, Idaho, Montana and Colorado, where placer operations were at one time very extensive, they have now dwindled to comparatively small proportions. In neither Nevada, Utah, New Mexico, Dakota nor Washington Territory has much placer mining ever been done, the product of gold from this source being larger in California than in all these other counties combined.

The greater portion of the placer gold now obtained in California comes from the drift mines which are here worked on an extensive scale. The business has, in fact, been steadily growing for a number of years past, it having received a considerable impetus through the partial cessation of hydraulic washing. Much ground formerly worked by the latter method is now operated by drifting, though the profits realized are not now so large as they were before, owing to the much greater number of men that have to be employed. Here, again, California is the only country in which this style of mining is much practiced, because here, only, do we find the Pliocene system of channels much developed; it being along these that all the large drift operations are conducted. But for her "dead rivers" drift mining even in California would cut but a poor figure. Very little gold is taken out by drifting in either the extreme northern or the southerly lying counties of the State, because these extinct rivers are entirely absent or show there in only a feeble way.

The Forest Hill Divide, Placer county, Liberty Hill and vicinity, Nevada county, Little and Big Butte creeks and the Megalia ridge, in Butte county, and Forest City and Slate Creek Basin, Sierra county, continue the sites of the principal drift operations in this State, though some drifting is done in a majority of the other mining counties. The larger companies engaged in this business employ from 100 to 150 men, their annual output of gold ranging from \$100,000 to \$300,000. The net profits on this output, once the mine is opened and equipped with plant, vary from 40 to 60 per cent, the results in this kind of mining, so long as the deposits last, being comparatively free from contingencies. Neither drouth, frost nor storms affect drift operations. These being mainly carried on under ground, neither the heat nor the cold, however intense, is much felt, while there is always water enough in the course of the year, even in the driest season, for washing the gravel taken from the drift mines. Last fall many of the quartz miners in the central districts of this State lost fully a month owing to an insufficiency of water to drive their machinery, but none of the drift companies were through lack of water, precluded from washing the stock of gravel they had taken out during the summer, though a few of them were delayed with this work beyond the usual time.

Wherever an opportunity offers to locate any drift ground it is at once taken up and properly secured, and thus the area of these operations is every year enlarged or the foundation laid for its extension. During the past summer a large tract of land on the ridge between the north and the south forks of the middle fork of the American river was taken up, surveyed and put in shape for perfecting title under the general mining laws. This tract covers the upper sections of the rich and extensive Pliocene channels that traverse the Forest Hill divide, notoriously the most productive in

the State. During the course of the present year it is expected that this ridge will become the scene of active and profitable drift operations, as the "Dead River" here wherever prospected or eroded by the modern streams show themselves strong and prolific in gold. The locators are experienced drift miners and possess themselves means ample for exploiting their claims and working them in an effective way. With the companies operating at Damascus, Sunny South, Bath, Forest Hill and other old and well known drift camps further down the divide, the past has been an exceedingly prosperous year, the outlook with the most of them being at the same time highly encouraging.

Going north, we find drift mining being resumed in the vicinity of Dutch Flat, Liberty Hill, and about Nevada City, where this class of operations had for a long time been much curtailed, or wholly suspended. At the Darheo mine, a little further on, near North Bloomfield, the year has also been a good one. The Bald Mountain Extension Company at Forest City have for several years past been dividing large profits, as have also the North America Company, operating at Whisky Diggings, in the Slate Creek basin, not to mention a score or more of smaller companies owning and working drift claims in that portion of Sierra county. On the west side of Slate creek a strong company have located and are preparing to open by means of extensive tunneling nearly the whole country reaching from La Porte to Gibsonville, a stretch of eight miles, and which in the early day was occupied by hundreds of miners, who worked their small claims through vertical shafts. The auriferous channels here, though not generally large, are rich and very numerous. The probabilities are that this company will achieve a great success.

After an interruption of several years, owing to litigation, gravel is again being taken from the Pershaker drift mine on the Megalia ridge, Butte county. The auriferous channel covered by this claim, though narrow, has yielded as much perhaps to the area worked as any other in the State. Now that work has been resumed there, new life seems likely to be infused into drift operations along the entire gravel range, here very extensive. Owing to the extent of these buried channels and the success that has latterly attended their development, drift mining is destined to see a long life in California, not one-tenth probably of the original drift deposits having yet been exhausted. How far they reach under the lava flow that covers so much of the westerly slope of the Sierra Nevada can, however, only be determined by actual exploitation.

#### Hydraulic Operations.

By reason of adverse legal proceedings, have for the past ten years been undergoing steady contraction in California, until now they have ceased entirely in the central and more active hydraulic districts of the State. Only in a few of the more northern counties is the business any longer pursued; Trinity river, in Trinity county, the Salmon and the Klamath rivers, in Siskiyou county, and Smith river, in Del Norte county, including the confluents of these several streams, being the principal localities where hydraulic washing is now carried on. There being in these counties no farming lands along the outletting streams, nor yet any other properties or interests exposed to be injured by the hydraulic debris, this branch of mining has not there been interfered with, nor, for the reason stated, is it ever likely to be. Enjoying such exemption from judicial restraint, the business in these several counties has undergone gradual but steady expansion, its growth having been somewhat accelerated in consequence of its suppression elsewhere. In several instances, the enjoined miners from the middle districts have sought these northern fields, and, carrying there their enterprise and large experience, have re-established themselves successfully in the business, the facilities for prosecuting it being in most cases extremely good. Along the Klamath river the conditions for carrying on this branch of mining are especially favorable, the auriferous gravel deposits being extensive and the material of good grade; water abundant and capable of being brought on the mines under all needed pressure, and at small cost, while the fall below them is almost everywhere sufficient to prevent any troublesome accumulation of tailings.

The climate is also excellent and timber

plentiful, the greatest drawback being the cost of freighting in machinery and supplies, the most of which have to be carried for a considerable distance on pack-animals. This trouble is, however, being steadily diminished, and may be expected in the course of a few years to disappear altogether through the construction of wagon-roads and railways. As a good deal of capital is now being embarked in hydraulic mining in that region, the business there may be expected to undergo such enlargement in the course of a few years as will in some measure make good the falling off that has taken place in the districts farther south, though it can in no event wholly repair such falling off.

Like the drift, the hydraulic deposits of California are so very extensive that neither this nor the next generation will see them exhausted, even though the present injunctions were raised and unrestricted washing enforced to go on.

Outside of California no very extensive hydraulic operations are to be seen, the deposits being comparatively small, and the plant used in washing them of corresponding capacity. Although the business has nowhere else been suppressed by the courts, in none of the other Pacific States or Territories has it attained anything like the dimensions reached in this State, either as regards the apparatus employed or the production made.

#### The River-Bed Miners.

Favored by a long-continued stage of low water, were enabled to gather a rich harvest of gold the past autumn, some of the cleanups made along the Scott, Salmon and Klamath rivers, the sites of the largest operations in this line, having been especially large. This branch of mining, after suffering a decadence that reached through many years, has in recent times undergone some revival, the miners having, in some instances, sought new fields of labor, while in others they have returned and worked over the beds of the streams worked long ago. That it has been possible for them to repeat this task has been due to the extent to which this class of deposits has, through the influx of all kinds of mining debris, been able to renew themselves. As the life of river-bed mining will be co-existent with this reproductive process, it is destined to reach through a long period, though it must, after the original deposits are used up, necessarily undergo some declension. At present it is a prosperous industry, and such it will, very likely, long remain.

#### Bullion Output.

The product of bullion for the year 1887, amounted, according to the following report of J. J. Valentine, to \$104,645,959, being an increase of \$1,634,195 over the product of 1886. Comparing the product of the two years by States and Territories, the following are the losses and gains made during 1887 as established by Mr. Valentine's reports for these two years respectively: California, Nevada, Washington Territory, Idaho, Utah, Colorado, Arizona, West Coast Mexico and British Columbia, all show some falling off; while Oregon, Alaska, Montana, Dakota and New Mexico have made more or less gains, the greatest gain, \$4,643,275, having been in Montana, where it was due to the large output of copper made last year.

John J. Valentine, vice president and general manager Wells, Fargo & Co., has kindly furnished us with the following statement of precious metals produced in 1887:

The following is a copy of our annual statement of precious metals produced in the States and Territories west of the Missouri river (including British Columbia and receipts by express from the West Coast States of Mexico) during 1887, which shows aggregate products as follows: Gold, \$33,074,022; silver, \$51,678,113; copper, \$10,362,746; lead, \$9,631,073; total gross result, \$104,645,959.

As stated repeatedly, the facilities afforded for the transportation of bullion, ores and base metals, by the extension of railroads into mining districts, increase the difficulty of verifying the reports of the products from several important localities. Especially is this the case in the reports from Colorado and Montana. The general tendency is to exaggeration when the actual values are not obtainable from authentic sources; but the aggregate result, as shown herein, we think may be relied on

with reasonable confidence as approximately correct.

#### Annual Products of Lead, Copper, Silver and Gold in the States and Territories West of the Missouri River, 1870-1887.

Year.	Gold.	Silver.	Copper.	Lead.
1870	\$1,000,000	\$1,000,000	\$1,000,000	\$1,000,000
1871	1,200,000	1,200,000	1,200,000	1,200,000
1872	1,500,000	1,500,000	1,500,000	1,500,000
1873	1,800,000	1,800,000	1,800,000	1,800,000
1874	2,100,000	2,100,000	2,100,000	2,100,000
1875	2,400,000	2,400,000	2,400,000	2,400,000
1876	2,700,000	2,700,000	2,700,000	2,700,000
1877	3,000,000	3,000,000	3,000,000	3,000,000
1878	3,300,000	3,300,000	3,300,000	3,300,000
1879	3,600,000	3,600,000	3,600,000	3,600,000
1880	3,900,000	3,900,000	3,900,000	3,900,000
1881	4,200,000	4,200,000	4,200,000	4,200,000
1882	4,500,000	4,500,000	4,500,000	4,500,000
1883	4,800,000	4,800,000	4,800,000	4,800,000
1884	5,100,000	5,100,000	5,100,000	5,100,000
1885	5,400,000	5,400,000	5,400,000	5,400,000
1886	5,700,000	5,700,000	5,700,000	5,700,000
1887	6,000,000	6,000,000	6,000,000	6,000,000

STATES AND TERRITORIES.	Gold Dust and Bullion b3 Express.	Gold Dust and Bullion b3 vessels.	Silver Bul- lion by Ex- press.	Copper Bul- lion by Ex- press.	Lead and Zinc Bul- lion by Ex- press.

with the most scanty means and little assisted by others, developed and outfitted the property and brought it to its present large and profitably productive condition, and this under circumstances especially adverse, the mine being far from the railroad and located in a region but ill supplied with either wood or water.

Several of the mines in the Tuscarora district, 60 miles north of Elko, have shown steady, and one or two of them notable improvement during the year, this being one of the liveliest and most promising mining camps in the northern part of the State. The country lying along and adjacent to the Carson & Colorado railroad extending from Walker lake south over 100 miles into Inyo Co., Cal., has also become the site of numerous active and profitable mining enterprises since the completion of that road. This halt of country abounds with deposits of gold, silver and copper, but nothing could be done with them notwithstanding their known richness prior to the advent of the railroad.

The whole of eastern and southeastern Nevada, a section of the States abounding in like manner with valuable mineral deposits, remains practically an unpeopled desert, owing to a lack of cheap transportation facilities; and is destined so to remain till these are furnished, as they are likely soon to be through the construction of the projected Salt Lake and Los Angeles railroad, which as surveyed will traverse this region centrally. As this road when finished will connect with the Southern Pacific system, the benefits likely to arise from the development of that extensive country will be largely shared by San Francisco and the agricultural districts of eastern and southern California. Such being the case, it is much to be desired that this road will be early begun and rapidly pushed to completion.

### ALASKA.

Although there is thus far only one great paying quartz mine in the Territory of Alaska, the future of quartz mining there is very promising. What ledges have been found are generally of very great size, and although the ore is of low grade its abundance is such that plenty of money should be made. The great mine on Douglas island has yielded over two millions of dollars already, and this coming season will have 240 stamps at work constantly. The mill is one of the most complete in the United States, and is the largest of any. The ore may be said to be quarried out, so wide is the ledge. Preparations are now being made to open other deposits of ore of like character on the mainland and the outlying islands of the Territory.

The discoveries of gold on the Yukon and Stewart rivers have attracted the attention of miners during the past year, and considerable placer gold has been obtained. Gold has been found in many places. The long duration of the winters and the severity of the climate away from the ocean are drawbacks to working the mines. Moreover, there are no roads anywhere, and the nature of the country makes it a difficult one to prospect in the summer months. Those who have been to the country advise no one to go there who is not well supplied with money. It is a poor country for a poor man.

On the mainland, across the channel from the Douglas island mine, six miles back from the shore, is the Silver Bow Basin, where more or less mining is carried on. The altitude is so great that the winters are very long. These mines are tributary to Juneau.

Both coal and copper have been found, though little work has been done in any of these mines.

Numbers of miners went to Alaska in 1887, attracted by the success of the Douglas island mine and the reports of rich placers on the Yukon and Stewart rivers. Many of these returned to Portland or San Francisco to winter, and will go back to Alaska this spring. But a goodly number remained in the Territory during the winter, so as to be on hand early in the season.

The cost and difficulty of getting to the placer-fields, wet though they may be, will deter any great number of men from going there. But as it is well understood that the country has scarcely been prospected at all, and there are plenty of chances for good placer or quartz stakes, it will be a favorite field for prospectors for some years to come. What placers have been found are wet; but as before stated, no man should go to the region without a good supply of money, as there is very little chance for employment in case of "going broke."

### ARIZONA.

Arizona has not made a very satisfactory record during the past year. The long continued low price of copper caused the closing down of some of her best mines for months, thus reducing the value of the total mineral products of the Territory. These have again been started up, however, since the rise in price of copper. The Tombstone mines have been comparatively inactive. There have been few developments which call for special mention. The opening of the rich Howard mine has been the principal mining sensation. The details of this find have been published in the PRESS. The vein was not a new strike, but an old location with ores worth about \$25 per ton. In doing the annual assessment work the owners struck a wonderfully rich chimney of gold ore, and more has since been found.

Arizona badly needs capital for its mining development. It has never had any such chance

ss Montana and Colorado in this respect. It is not likely, however, that this state of things will continue much longer. The Prescott *Courier* says: The mining industry was very much depressed last year, and yet our miners added about \$7,000,000 to the metallic wealth of this world, raised the reputation of our mining-fields, until now capitalists and good miners are coming by the score to help in the development of our rich resources.

The new-comers are more than pleased with the mines and the country, and wonder why so few miners have, in the face of so many drawbacks, accomplished so much. They find fine mines in the midst of plenty of timber and are more than surprised to see for themselves that water is far from being scarce in what has been slanderously put down as a desert.

Their only objections are to owners of patented claims who, they say, do not care to work or lease them, and to so many prospectors holding valuable mines they will not or cannot work. These objections can and will be removed. Our districts are, we may say, unprospected, and richer ledges than any now known will yet be discovered. Our placer mines are unworked, and remain to reward capital and labor. Up to the present the *Courier* has not advised prospectors and miners to come here, but our winter is now almost over, and such people may "pack up" right away and come to Northern Arizona. If they cannot prospect in the elevated districts for a month or more to come they can prospect and work in several foothill districts. There was a time when, we confess, we were discouraged in regard to our mines; this was after the failure of many self-styled mill men to work our ores with profit. Most of these came here not to work ores for profit, but to work the pockets of those who sent them here, and hilk our people. The building of the railroad led to the starting of sampling works in Prescott. Both institutions have worked honestly and faithfully for mining success, which is happily achieved. Croakers have said that after the old dumps were exhausted there would be an end to the shipping of ore. They prophesied wrongly. The mines continue to yield more rich ore than can be transported, and so the good work goes bravely on.

In speaking of mining, the Governor of the Territory in a recent report says:

Taken in the aggregate the mining industries of the Territory are on a safe and promising basis. The speculative characteristics which too long marked this especial industry are fast disappearing, and that stable, economical, sound business prudence, which alone brings success, is taking its place. Mining for precious metals is just as legitimate a business as that of any other branch of industry, but it requires the same amount of care, judgment and intelligence, and when these essential requirements are ignored, failure and disappointment inevitably follow, to the general detriment of this, one of the most important and growing industries of the country. Owing to a lack of railroad facilities to cheapen the cost of transportation, very many of the most valuable mining properties of the Territory, of necessity, have not been worked. This is especially true of many of the mines of Northern Arizona, which produce a heavy percentage of base ore, and cannot be treated by milling process, and, therefore, need cheap transportation to be profitably shipped to remote points for treatment. Sampling works have been erected at Kingman, on the line of the Atlantic and Pacific railroad, and at Prescott, at the terminus of the Prescott and Arizona railroad, and at Tucson, on the line of the Southern Pacific road. Miners are now having their ores crushed, assayed and purchased at these points. This facility has given renewed impetus to mining in these localities, and is a healthful sign. Most of the mining claims are owned by hard-working, honest prospectors, whose only capital is strong arms and indomitable will. Now they can procure a "grub stake," work their claims, take out ore and pack it to the sampling works, receive payment and return to their work, ready to extract more. Not waiting for capitalists to come to their aid, they manfully labor, develop their own property and enjoy the profits.

This system must prove a new epoch in the mining history of Arizona. It insures the certain development of that great metalliferous wealth which lies hidden in every mountain range in Arizona, from its northern line at Utah to the southern boundary of Sonora. Arizona as yet is practically a virgin soil to the miner; her surface has only been scratched. Over \$15,000,000 of silver were produced by the three mines in the Tombstone district, at a depth of 600 feet and above water level. The famous Silver King mine, of Pinal county, yielded, as estimated, over \$7,500,000 in the past 11 years, and still promises better returns. The great Vulture gold mine, of Maricopa county, which is estimated to have produced some \$5,000,000 within a depth of 500 feet, for years past, has fed and is now feeding an eighty-stamp mill, and is worked day and night. These especially enumerated cases prove that while the "pay streak" of her mines may start at "grass roots," yet her grand ore hodies go down to the howels of the earth. Nature has indeed been lavish with Arizona in the distribution of her mineral wealth, and the day is not far distant when she will lead in her "output" of precious metals. Arizona is also rich in copper, and in 1884 ranked as a third producer of this valuable metal. Three thousand miles removed from the eastern seaboard, she has successfully com-

peted with lake copper. Her ore hodies are larger, and rich, averaging from 4 to 25 per cent, often carrying also a high percentage of silver. With increased facilities of railroad communication, cheapening of coke and transportation, and a fair price for copper, this especial industry must assume large proportions, giving employment to thousands of miners, and adding greatly to the wealth of the Territory.

### COLORADO.

Colorado still keeps the lead of all the mining States and Territories in amount of bullion production, although Montana is now beginning to "crowd" the Centennial State. In addition to its precious metals, Colorado produces plenty of coal and iron. The Denver *Republican* has compiled careful statistics of the production of the State, and we quote from an article in that paper:

The total value of the production for the year is placed at \$24,576,043.79, which is a little more than \$2,000,000 less than the amount reported last year. The value of the different metals produced was as follows in round numbers: Gold, \$5,000,000; silver, \$14,000,000; lead, \$5,400,000; and copper, \$240,000.

The average prices of silver and lead during the year 1886 were \$1.01½ per ounce for silver, and \$4 67½ per hundred for lead. During the past year the average prices have been 97 cents and \$4.50 respectively, and these prices have reduced the value of the product over \$1,000,000 below what it would have been at the quotations of the preceding year.

The production in detail, as reported by the different establishments, which gave their consent to a publication of their production, separate from the aggregate, and from all other sources, was as follows:

#### The Omaha and Grant Works, Denver.

Lead, 35,299,293 pounds at \$4.50.....	\$1,588,468 18
Copper, 726,400 pounds at 12c.....	87,168 00
Silver, 4,825,809 ounces at 97c.....	4,681,034 73
Gold, 58,965 ounces at \$20.67.....	1,218,808 20
Total.....	\$7,575,479 11

#### The Holden Works, Denver.

Silver, 2,181,683 ounces at 95c.....	\$2,072,551 54
Gold, 12,820 ounces at \$20.....	256,400 00
Lead, 19,481,577 pounds at \$4.50.....	876,296 54
Copper, 10,635 pounds at 10c.....	1,063 50
Total.....	\$3,226,298 58

#### Boston and Colorado Works, Denver.

Silver, 2,181,683 ounces at 97c.....	\$2,634,305 00
Gold, 36,235 ounces at \$20.67.....	748,386 00
Copper, 3,203,391 pounds at 12c.....	384,400 00
Total.....	\$3,767,091 00

#### Pueblo Smelting and Refining Co., Pueblo.

Silver, 1,701,190 ounces at 97c.....	\$1,650,154 30
Gold, 10,280 ounces at \$20.67.....	132,487 00
Lead, 11,589,306 pounds at \$4.50.....	521,518 77
Copper, 73,950 pounds at 12c.....	8,871 60
Total.....	\$2,294,032 27

#### Colorado Smelting Co., Pueblo.

Silver, 1,152,381 ounces at 97c.....	\$1,117,809 57
Gold, 5,002 ounces at \$20.67.....	112,010 00
Lead, 17,936,376 pounds at \$4.50.....	781,136 82
Total.....	\$2,010,956 39

#### Arkansas Valley Smelter, Leadville.

Silver, 1,222,419 ounces at 97c.....	\$1,185,746 43
Gold, 4,419 ounces at \$20.67.....	91,340 73
Lead, 15,002,000 pounds at \$4.50.....	675,090 00
Total.....	\$1,979,177 16

#### American Smelting Company, Leadville and Canyon City.

Silver, 1,159,202 ounces at 97c.....	\$1,124,475 94
Gold, 3,761 ounces at \$20.67.....	77,759 87
Lead, 16,836,541 pounds at \$4.50.....	825,144 34
Total.....	\$2,027,380 15

#### Harrison Reduction Works, Leadville.

Silver, 1,007,455 ounces at 97c.....	\$ 977,231 35
Gold, 6,771 ounces at \$20.67.....	139,956 57
Lead, 10,856,521 pounds at \$4.50.....	488,543 44
Total.....	\$1,605,731 36

#### Manville Smelting Works, Leadville.

Silver, 368,672 ounces at 97c.....	\$ 356,611 84
Gold, 2,824 ounces at \$20.67.....	58,372 08
Lead, 5,095,130 pounds at \$4.50.....	229,325 85
Total.....	\$ 644,309 77

Product of other smelters in the State.....	\$ 3,000,000 00
Yield of Colorado stamp-mills.....	1,100,000 00
Product of placers in Colorado.....	400,000 00
Sold to manufacturers.....	75,000 00
Sent to other places.....	325,000 00
Total.....	\$90,031,056 79

Amount produced from other States and Territories.....	\$5,194,073 00
Amount duplicated in smelter returns.....	260,940 00
Deducted from total.....	\$5,455,013 00
Colorado's production, 1887.....	\$24,576,043 79

Probably the most noticeable feature in connection with the year's progress in mining is the introduction of economical mining methods. The prices of lead and silver have compelled mine managers to adopt all possible means of economizing, and the result must be of marked benefit to the industry. There is much more yet to be done in this way, for the tenderfoot and incompetent mine manager is not yet a rarity.

Leadville still retains its leading position, as was to be expected, as the chief ore-producer. The total production of the camp during the year is placed at 350,000 tons of ore, including the silver-bearing iron ore. None of its larger mines have been exhausted, while several new producers have been added to the list, and the amount of ore reserved developed, awaiting extraction, is larger than one year ago.

Chaffee county shows great progress, especially in the Chalk Creek district, embracing the Murphy group of mines. Monarch district

of this county held its position as the second largest ore-producing region in the State until the railroad reached Aspen, and shipments began from that point in November. Monarch now stands as the third producing district in the State. The Madonna of this camp has during the past year shipped less than 15,000 tons of ore, against 40,000 during the preceding year, but the Eclipse of the same camp has increased from a small production to 36,000 tons.

Pitkin county, embracing the Aspen mines, has more than fulfilled all that was reasonably expected of it in the way of development. Immense bodies of ore have been disclosed on Aspen and Smuggler mountains which are awaiting the completion of work necessary for their most economical development or the settlement of litigation involving the ownership of the properties in which they are found. The extent of country containing large hodies of ore is found to be considerably larger than was known to be the case one year ago, and the end is not yet reached. Since the commencement of ore shipments by rail from this camp on Nov. 2d they have averaged over 180 tons daily. This amount has been taken mostly from reserves that lay upon the dumps and from ore hodies which have been disclosed during the past few months and were not known one year ago. The vast reserves standing in the great mines of Aspen mountain have not been touched.

The Battle Mountain district of Eagle county shows more ore than one year ago, though no effort is made to push production. The principal mine of the mountain, whose ore in sight is estimated at from \$2,000,000 to \$4,000,000, has lain practically idle awaiting a sale. It has just begun shipping, and the daily product of the camp averages about 60 tons.

The peculiar ore deposits in quartzite show no signs of exhaustion, and are, if possible, more of a puzzle to geologists than they have ever been. Development indicates that the ore-bearing horizon there is more extensive than was supposed.

Boulder county has exhibited more life than for many years. The Caribou mine has been started up after a long period of idleness and that silver camp is in a prosperous condition. Ward district, which is a gold-bearing region, is doing more and producing more profit than it has produced for years. The same can be said of every portion of the county.

Gilpin has disclosed some rich and profitable ore hodies in regions which have been devoted exclusively to growing oats and potatoes for 20 years past. Old mines have been started up for systematic production and new ones are undergoing development. It has been an unusually prosperous year for this pioneer gold district.

Summit county on account of its gold deposits in the neighborhood of Breckenridge has been unusually active, and has increased its output as well as opened the way for a larger increase during the coming year.

Gunnison county has got pretty well out of the feverish stage incident to a great boom and its mines are passing into the hands of men who are able and willing to work them for the profits obtained in legitimate mining. The Sylvanite mine near Gothic is the present noted property in the county on account of a large production of native silver. At White Pine, on the Tomichi, the May contact has passed into new control and will again become a noted producer. The Eureka of the same camp is undergoing development and showing large reserves, while other properties in the same region are coming out from a long sleep. On Rock Creek very important developments have been made, insuring a large production from this region in the not distant future.

The San Juan country, except in Ouray and San Miguel counties, has shown no marked improvement. Shipments from Silverton have fallen off about 2000 tons.

There are now in blast in the State about 50 water-jacket silver-lead stacks, having a daily capacity of about 2000 tons, in addition to the six or seven reverberatory furnaces at Argo. In addition there are about 35 calcining furnaces constantly in use. Some decidedly important improvements in furnaces have been made during the year which mark a long step in advance in the science of smelting.

Great advances have been made in this method of treating ore during the year. At Leadville some immense mills have been erected, all using jigs and slime-helms, with various kinds of sizing appliances. The capacity of the mills now working in Leadville is about 800 tons daily.

During the year a great advance has been made in the method of concentrating the tailings from stamp-mills. A simple and cheap machine has almost universally taken the place of the various kinds of helms, huddles and tables lately in use, and the increased saving reported varies from 5 to 25 per cent.

Altogether, the year was one of substantial progress in all that relates to the well-being of the mining industry, while the new year is ushered in with promise of increased production.

### IDAHO.

Idaho is making good progress in mineral development. It is an extensive mineral region probably not half prospected yet. Its most important section is that of Wood River, which embraces an area of some 75 miles in length and of the same width. There are several good mines and many undeveloped prospects. Only high-grade ores are being worked, high freight

rates keeping mines with low-grade ore in the background. A summing up of the mining industry of that section was lately presented to the Hailey Board of Trade as follows: The undersigned, your Committee on Mines and Manufactures, beg leave to submit the following report: During the year ending December 31, 1887, there were shipped from the city of Bellevue 17,823,954 pounds of ore, and from the town of Hailey 7,031,859 pounds, making the ore shipments from Hailey and Bellevue, in the aggregate, 24,855,813 pounds, or 12,429 tons, and from the Ketchum sampler, not including the Philadelphia & Idaho Company's works, 1528 tons, making a total of 13,957 tons (exclusive of the Philadelphia & Idaho Company's works). Taking 13,957 tons at an average of \$150 a ton, the amount reaches \$2,093,550 gross; from this sum there was paid to the Union Pacific Railroad Co. \$20 a ton for freight, amounting to \$279,140, and to the different smelting and refining companies which purchased the same, \$14 per ton, amounting to \$190,398.

The Salt Lake Tribune says: While the production of the great Wood River country for the past year was not so great as its mine-owners anticipated at the beginning of the season, it was large, and considering the circumstances of high waters in the spring and other retarding influences, the output was rather satisfactory. The work of the three samplers, Bellevue, Hailey and Ketchum, show 24,861,049 pounds of ore handled the first 11 months of the year. December was a light month, but would add enough to bring the grand total up to 26,000,000 pounds, aggregating 13,000 tons of ore. The amount of metals in this ore could not be ascertained, but taking what is understood to be the average value of Wood River ore, and it would make about 6000 tons of lead and 1,400,000 ounces silver. Besides this, the Philadelphia & Idaho Co. smelted large quantities of ore at their Ketchum plant, of which figures were not given. While the country has its divisions into various camps, the district as operated really embraces Bellevue, Hailey, Ketchum, Bullion, Gold Belt, Smoky, Boulder, Sawtooth, and a number of other localities, the names of which are common in speaking of mining affairs.

Prior to the starting of sampling work at Bellevue over one year ago, all the sampling for that immediate locality was done at Hailey. Since then it is done at Bellevue, and the ore is also shipped from there, but it is reported through the head office at the Hailey sampler, the two belonging to the same owners, and yet the Bellevue sampler did the greater portion of the sampling.

It was impossible to get full reports of the ore sampled by these two mills for the entire year, but their work for the first 11 months reaches a near approximation, as during December the shipments were very light. Some of the mines named sent portions of their ore to the Ketchum smelter, hence to get their actual output in pounds the two reports require consolidation in some particular cases. Only such mines as produced a number of tons any one month are named among the 33 in the list, while the smaller ones are hulked at the end. Following is a list of ore sampled at Hailey and Bellevue from Jan. 1 to Dec. 1, 1887:

Name of mine.	Pounds ore.
Mine Moore.	11,019,888
Ore of the Hills.	4,222,748
Idahoan.	3,748,215
Tyrannus.	250,652
Carrie Leonard.	244,619
Light (lease).	141,782
Mayflower.	357,759
Stormy Galore.	158,991
Nettie (lease).	156,665
Snow Fly.	150,374
Emery.	149,083
Nay Aug.	132,895
King of the Hills.	122,187
Overland.	107,748
Idaho Democrat.	98,911
Relief.	86,569
Narrow Gauge.	81,151
Jumbo.	81,083
Red Cloud.	81,083
King of the West.	49,033
Yankee Blade.	47,768
Bay State.	44,070
Abbie.	43,905
O. K. (lease).	43,716
Mountain View.	39,625
Elkhorn.	40,374
Bullion (lease).	33,298
Amicus.	32,474
Colorado.	32,474
Montana.	19,186
Argent.	9,199
Oriental.	6,404
Parker.	439,318
Small properties.	22,329,877

Total. 11,414 tons and 1877 pounds. The value of these ores was probably about \$1,400,000.

#### Ketchum Sampler.

During the past year the Ketchum Sampler handled ore from a large number of small mines scattered over the Wood River, Smoky, and other districts. Its business is represented by the following figures:

	Pounds.
Carrie Leonard.	1,006,000
Elkhorn.	478,000
Sundry mines.	1,572,000
Total.	3,056,000

Or 1528 tons of ore.  
Little Wood River, or Muldoon, has been neglected of late, the smelter lying idle. Smoky district made a decided advance. The King of the West yielded \$70,000. The Silver Star, Carrie Leonard, Tyrannus, Stormy Galore and Dollarhide are the principal mines. Considerable work was done at Sawtooth, but the closing down of the Vienna had a depressing effect. The Salmon River country embraces Chablis, Bay Horse, Clayton, Custer and Bo-

naaz. The Boardley, Ruinstorm and Skylark are prominent mines. The Yankee Fork country made more progress the past year than is generally known. The past history of the Gen. Custer mill and the mines belonging to that company is one of steady productiveness during the eight years since the company began operations. The Custer mine was a marvelous deposit on the surface, like a wart on the mountain, from which millions in value was quarried off before getting beneath the surface. The slide rock from this mine was the first to send ore out on pack animals, and led to the erection of the 20-stamp mill, which has since been increased to 30. That mill since February, 1881, has produced bullion to the value of nearly \$4,000,000, most of which came from the mines belonging to the company in the following rotation: Custer, \$2,700,000; Unknown and Summit, \$700,000; Badger, \$250,000; Lucky Boy, \$200,000; and other properties bringing the product up to about the sum stated. The mill is now shipping bullion to the value of about \$30,000 per month, and when their late purchase—the Continental—is fully opened this amount will be increased materially. The past summer ample preparations were made by the company to continue work right along and add much to the output.

The Charles Dickens, Washington, Paradise, Hidden Treasure, Fraction and other mines are prominent.

The old camp of Rocky Bar made a good record as a gold-producer during the last five months of the year. The Alturas Gold, Limited, Company, a London corporation, started their fifty-stamp mill in December, 1886, but up to June of the past year did not get down to good work. About that time there was a change in management and the property has been placed on a paying basis since then.

At the Boise City Assay Office \$920,933 were deposited in gold in 1887.

The Inter Idaho says: Everything looks favorable for such an increase in population, wealth and general development in Idaho next year as she has never before seen in a single season. Her mining districts have all made a great stride forward during 1887. The phenomenal growth of Wood River shows no signs of diminishing. On the contrary, it looks probable that what has been done is but a small beginning of what the next few years will bring us. The new lead belt, near Era, is already attracting wide attention, and next year may show that it is a second Leadville. Sheep Mountain gives promise of making a great stir next year. There are those who believe it will create an excitement not far behind that of the Cœur d'Alene country. Still others think that next year's greatest boom will be in the region about Salmon City. It would take a column to enumerate the districts throughout Southern and Northern Idaho whose developments during the past year have been very flattering.

In the Cœur d'Alene country developments on lode claims have gone on steadily. The Bunker Hill-Sullivan mines yielded \$567,000 for last year in lead, and silver, \$256,500. The Sierra Nevada yielded \$40,000. On the upper south fork there is a very large number of producing mines. The mines of the north fork of the Cœur d'Alene have by no means kept pace in development with those of the south fork. The placer yield of the Pritchard, Tiel, Beaver and the tributary streams and the old wash is reckoned to amount to \$150,000 for the year.

Of the developed quartz mines, the best known are those belonging to the Idaho, Golden Chest and Golden King Companies, all Eastern organizations, with the Occident, Treasure Box and Mother lode claims, which are owned by residents. The three former have mills, the three latter are stratas. The former are not paying, while the latter are. It is impossible in the brief space at disposal to even mention the names of the mines and claims of this region, the wealth of which is only now becoming properly recognized.

#### MONTANA.

No mining region has made such great strides within the past few years as Montana, and this has been principally due to the wonderful productiveness of the mines of Butte. That camp contains the most remarkably productive group of mines in the United States. After the exhaustion of the famous placer mines in Alder gulch, Montana attracted comparatively little attention from mining men. It was sparsely settled, there were no railroads, and little capital was invested in its mines. Since the discovery of Butte, however, all this has changed. Capital has been attracted to the country, railroads have been built, and rich mines opened and developed. The mines of Butte employ a great number of men. Miners' wages are \$3 50 per day, laborers and top-men receiving \$3, and timbermen, engineers and other skilled workmen from \$4 to \$6. The average wages paid by the mining companies, therefore, is \$100 per month. Following is a list of the employing companies and the amount of their pay-rolls per month:

Company.	Men Employed.	Average Pay-roll.
Anaconda (smelter included).	1500	\$150,000
Alice.	350	35,500
Lexington.	300	30,000
Moulton.	100	10,000
Bluebird.	300	30,000
Silver Bow.	250	25,000
Colorado.	300	30,000
Boston Con.	200	20,000
Butte Reduction Works.	50	5,000
Clark Properties.	250	25,000

Chambers' Syndicate.	300	30,000
St. Louis Company.	75	7,500
On Leased Mines.	200	20,000
Cora.	25	2,500
Miscellaneous.	500	50,000
Totals.	1700	\$170,000

The above figures we take from the Butte Inter-Mountain holiday edition, a splendid number, devoted to the interests of that camp. We quote extensively from sundry articles published in that paper. Following is the amount of the precious and base metal output of Butte for the year 1887, as nearly as it can be ascertained from official and semi-official sources. It will be seen that the increase as compared with the product of 1886 is almost \$3,000,000:

Silver by Union Pacific Express.	\$5,720,000
Anaconda, \$2,000,000 pounds copper at 10c.	5,000,000
Parrot, 10,000,000 pounds copper at 10c.	1,000,000
Clark's Colusa, 7,200,000 pounds copper at 10c.	720,000
Clark's Colusa, gold and silver.	600,000
Colorado, copper and silver.	83,000
Boston Con., 1,500,000 pounds copper at 10c.	150,000
Boston Con. silver.	42,500
Butte Reduction Works.	432,000
Butte Sampling Works, silver and gold.	300,000
Silver in matte (estimated).	1,000,000
Total.	\$16,143,500

The number of stamps now in operation in Butte by the several mining and milling companies is as follows:

Bluebird.	60 stamps
Lexington.	50 "
Moulton.	40 "
Alice.	80 "
Silver Bow.	40 "
Baxter.	10 "
Baltimore.	15 "
Old Lexington.	10 "
Total.	340 stamps

These 340 stamps crush an average of one and a half tons of ore per day, per stamp, depending somewhat on the hardness of the quartz. Altogether this amount of silver ore treated by the milling process in Butte per day exceeds 500 tons, or 15,000 tons per month. During the year 1887 10 stamps have been added to the Silver Bow mill and 20 to the Bluebird mill.

In addition to the above list of stamp-mills in operation in Butte may be mentioned the following mills in running order in other parts of the Territory:

LOCATION.	COMPANY.	STAMPS.
Deer Lodge County, Granite Mountain.		70
" "	Hope.	10
" "	Anaconda.	60
" "	Black Pine.	10
" "	Cab's.	30
" "	Pyreness.	10
Lewis and Clark Co., Drummond.		10
" "	Jay Gould.	10
" "	Empire.	75
" "	Gloster.	80
" "	Sterling.	10
Jefferson Co., Elkhorn.	20, Belmont.	50
Madison County, five gold-mills, total.		50
Miscellaneous.		50
Total.		635
Add stamps in Butte.		340
Grand total in Territory.		975

In addition to the stamp-mills above enumerated, there are in operation in Montana the following great smelting plants:

LOCATION.	COMPANY.	CAPACITY TONS.
Silver Bow County, Colorado.		25
" "	Clark's Colusa.	150
" "	Parrot.	350
" "	Boston Con. (old works).	150
" "	Butte Reduction works.	100
Deer Lodge County, Anaconda (when completed).		3,000
Beaverhead County, Hecla.		200
" "	Tascara.	25
Jefferson County, Helena M. & R. Co.		30
Gall, in County, Minneapolis & Co.		40
" "	Republic Mfg. Co.	40
Total capacity.		4,430

Many of the mills and smelters above enumerated have had their capacity greatly enlarged during the past year, and others are contemplating many improvements during the year to come. The Boston Con. will probably build an entire new plant; the lower works at Anaconda, designed to treat silver and lead as well as copper ores, will be completed; the Wickes works will either be enlarged or torn down and rebuilt, and a number of other big reduction enterprises now under consideration will soon be perfected.

The famous Alice mine, after running continuously since 1876, hung up its stamps in September last, on account of the Union Pacific R. Co. refusing to reduce the cost of transportation of milling salt to \$7.50 per ton. The account of these differences has been given in the PRESS. In addition to the Alice and Magna Charta mines the company owns several others. During the past year the company kept its mills in operation for nine months, reducing 28,000 tons of ore, against 39,870 in 1876. The total ore production during the past six years is 200,000 tons of ore, while 440,000 tons of waste have been hoisted. The bullion production of this company during the nine months of operation was \$632,277.23. The Moulton mine, a dividend-payer, produced some \$500,000 last year. The Lexington produced from \$60,000 to \$70,000 per month, partly from custom ore. The dividend received of this mine is \$565,000. The Mountain View, Colusa and West Colusa, with other properties of less prominence, have been consolidated into the Boston Cons. Co. An extensive concentrating and smelting plant has been determined on.

The plant of the Anaconda mine is as complete as enterprise and money could make it. The upper or main smelting works consist of four large buildings from 300 to 500 feet long and 100 to 200 feet wide. These are the concentrators, two smelters and matte-house. In these buildings they treated 1200 tons of copper ore per day in 1887. There are 26 furnaces, the combined product of which in matte is 140 tons, carrying uniformly 65 per cent copper. The new works, one mile below, will have 32

matting furnaces, or 56 in all. It is said the company will this year discard the usual ore-crushing appliances and use ten Ball steam-stamps, each with a capacity of 250 tons per day.

The copper product of the Anaconda Co. for the year 1887 from the upper works is stated by the company's chief representative to be 26,000 tons, or 52,000,000 pounds. This is about double the product of last year. It is within 3,000,000 pounds of the total product of the camp of Butte for 1886. It is estimated that the product of the new works will be limited to 8000 tons of fine copper per annum, making the total annual production of the company hereafter 34,000 tons, or 68,000,000 pounds. This will exceed the production of any copper region on the globe with the single exception of Spain.

During 1887 the company used 73,000 tons of coal and 48,000 cords of wood. The former comes from the Union Pacific mines in Wyoming, and the latter is flumed from the contiguous timber districts to the railroad, and thence hauled to this smelter. The contract under which this wood is being delivered calls for 300,000 cords.

The matte shipments of the company are about 140 tons per day, mainly to Baltimore and Liverpool. The company pays the railroads for freight on ore, matte, fuel and supplies \$75,000 per month, or \$900,000 per annum. It is estimated that the Anaconda Co. will furnish in 1888 65 per cent of the entire tonnage of the Union Pacific, Northern Pacific, and Montana Central to and from the cities of Butte and Anaconda.

This great property is owned mainly by Mr. J. B. Haggins of San Francisco, Cal., and Marcus Daly is general manager.

Among the great mining and smelting enterprises of Butte, the Parrot ranks second only to the Anaconda. The average amount of ore treated is 250 tons daily. Its plant is the most perfect in Montana, and its product is pig copper assaying 98 per cent, produced by the Manhes or Bessemerizing process. The Parrot mine is 600 feet deep and in a splendid state of development, having a productive capacity of 500 tons daily. Clark's Colusa concentrator and smelter has a total capacity of 200 tons daily. It has two blast and two reverberatory furnaces, and has worked continuously during the year on copper, silver and gold ore. The Butte reduction works is a comparatively new enterprise, with one 100-hp furnace which has made a splendid record for the year.

The great mineral-fields of Montana are located in the Rocky mountains, which cross the Territory from north to south near its western end. Thus the counties of Madison, Beaverhead, Silver Bow, Deer Lodge, Missoula, Jefferson and Lewis & Clarke contain the mighty deposits of ore which have made Montana so famous as a mining region. The northern and eastern counties are noted chiefly for their agricultural and stock-growing resources.

The Drummond is one of the famous mines of Montana. We recently gave in the PRESS a full account of the condition of this mine, and of its remarkable bullion yield, so that it is not necessary to again refer to it. In 1887 it earned dividends of \$1,500,000 out of a total product of \$2,500,000. The ore carries silver-gold.

The famous Granite Mountain, which pays \$200,000 a month in dividends, is a silver mine. The Drummond, Granite Mountain and Anaconda are the three most famous mines of Montana. There are hundreds of lesser mines in the Territory which, for the amount of money necessary to operate them, are equally pre-eminent to their class, and which are yielding a fully proportionate product. Among these may be mentioned the great Bluebird, the Beton consolidated properties, the Parrot, the Moulton, Lexington, Chambers syndicate properties, the Pollock, Gagnon, Silver Bow Company's mines in Butte, and the Hecla mines at Glendale, the Alta at Wickes, the Cahle mine in Deer Lodge county, the Jay Gould, and many others which could be named, each of which is a great treasure-vent. Such mines are self-developing. They pay a continuous profit and they are not for sale. But there are many thousands of mines in the Territory of equal promise, though less development, which are for sale. They are mines in which the work requires expensive machinery; or where the ore will not stand custom rates, but would pay handsomely if it were treated by the company owning such properties; or where transportation facilities are limited and need improvement; or where the ore is low grade and requires concentration, or where a great plant is necessary to secure the best results.

Mr. Spruille Braden, the superintendent of the United States Assay Office at Helena, furnishes the following statement of gold and silver deposited during the year 1887 at that institution. The standard ounces of gold were 71,114,639, and of silver, 36,222 35, their value for the several months being as below:

Months.	Gold value.	Silver value.
January.	\$85,108 80	\$1,425 47
February.	248,200 41	505 38
March.	243,352 63	324 55
April.	66,888 91	872 78
May.	95,009 74	6,503 20
June.	78,932 85	2,270 65
July.	95,052 89	1,602 26
August.	161,070 43	3,647 64
September.	248,532 51	7,397 98
October.	135,842 48	3,318 95
November.	217,172 70	5,047 37
December (apx.).	108,586 52	2,623 61
Totals.	\$1,323,060 26	\$31,606 79
Total value gold and silver.		\$1,354,667 05

## NEW MEXICO.

New Mexico stands credited this year with a total hillion product of \$4,229,234, as against the sum of \$3,821,871 in 1886. This shows some increase, though the figures do not really indicate the advance in the mining industry. The condition of affairs there is better than ever before. The Socorro *Bullion*, in speaking of this, says: "Though the prospector's campfire has gleamed from every mountain side and his pick and shovel delve the earth in quest of golden treasure, yet the vast resources of this Territory are scarcely realized by the oldest inhabitants. In his eagerness to come upon a second Golconda, the prospector often treads under foot mineral which, if properly treated, would make him rich returns. Here, then, has been our mistake in the past. We have discarded good things in the hope of obtaining better, and the old ground has now to be gone over a second time. The eyes of the miner are at last opened to this fact, and the dawn of prosperity is at hand." Reports from every camp confirm these statements, abandoned claims are again being worked and with success; money is now spent freely on mines which were once considered of little value. Wealthy St. Louis and other Eastern companies are investing in New Mexico mining property, and a general feeling of confidence is established. The tendency has been to sink a few feet and then make no further effort to develop other than to keep up the assessment work. This year, however, nearly all mine-owners are arranging to push to a depth of several hundred feet, and we may reasonably expect that good results will accrue from these renewed exertions."

The New Mexican papers are not satisfied with Mr. Valentine's estimate of hillion product. The *Silver City Enterprise* says: "Julius Wagner, local agent for Wells, Fargo & Co. here, states that he on application furnished Mr. Valentine with the amounts of raw ore and hillion shipped from railroad points in this county which he had collected and which in the aggregate are as follows:

Gold (hillion and dust) ..... \$ 147,800  
Silver bullion ..... 279,434  
Base bullion concentrates, etc., by freight. ... 3,769,000  
Total for county ..... \$4,176,234

"According to Mr. Valentine's report, the total output of the Territory is but \$4,229,234, or but \$50,000 more than that of Grant county alone. There is beyond question some mistake if Mr. Wagner's figures are anywhere near correct, and there is no reason to believe they are too large, as it has been discovered that he has overlooked several important shipping points in his compilation of the county output. The shipments from Whitewater Station, Florida Station, Gage, Gold Hill, Stein's Pass, Tres Hermanos and Lordsburg were overlooked in the report, and as a considerable amount of raw ore was shipped from these places, the output will certainly reach \$5,000,000. The Socorro smelter output for the year was 4,319,455 pounds of base hillion, containing

208,399.27 ozs. of silver value ..... \$201,724.40  
607.48 ozs. gold value ..... 12,149.35  
4,305,276 lbs. of lead value ..... 189,726.00  
Total value of gold, silver and lead ..... \$403,599.85

"The output of Sierra county has certainly been much larger than that of any other county in the Territory, as any person familiar with the outputting mines can attest. But admitting that these figures are in the abstract correct, the output, not including Sierra county, should be in round figures \$4,582,833.85."

The same paper in speaking of mining progress there, says: "The progress that the mining industry of this county has made during the past two years, if we stop to consider it, is truly wonderful, and especially is this true of Pinos Altos. Since the year 1860 the mine-owners of this camp have been satisfied apparently with chloriding and gophering around on the surface of the lead mines, not caring to penetrate the base metal which usually comes in at a depth of from 25 to 200 feet on the prospected veins. It remained for Peter Wagner, a man well known in this community, to demonstrate the fact that the wealth of the camp lay in its base metal and not in the surface or free-milling ores, beyond which the old-timers dare not penetrate and on which many of the best mines had been worked out. The sulphur, antimony, zinc, copper, lead and iron contained in the base metal found in all the leads at various depths seemed to deter mining and milling men alike from attempting to successfully treat it, but after the experiments of Mr. Wagner in concentrating the base metal and catching the gold on plates, the problem was successfully solved. Machinery for crushing the free-milling ore had long and successfully been used, but not until the Bell & Stephens and Wagner mills commenced treating the sulphurets did the camp begin its present prosperous boom. The decrease in the output of the alluvial mines during the past three or four years is due to the fact that the dirt has been worked over many times and that the mills necessarily consume a large amount of the limited water supply. Twenty years ago there were 31 stamps running on the free-milling ores of the Pacifics, Minnie Grande and Deep Down veins—the three most important leads that traverse the mineral belt of the camp. These stamps were hung up and abandoned many years ago and the camp dropped into a lethargic state that it has taken years to overcome. At the present time there are 30 stamps dropping in the camp and by the close of this year there will be at least 60, if the enterprise now being pushed through by the three St. Louis companies, namely, the Mountain Key, Deep Down and Pacific, is carried to completion. At present the principal and best paying mines are the Mountain Key, Deep Down, Asiatic, Wagner and O. Ceola. There are many others producing ore which will eventually be treated at one of the mills of the camp."

As to the mines of Organ the Rio Grande *Republican* says: "Everything goes to show that the Organ mines are taking on a new lease of life which is of a healthier nature than any yet experienced in that camp. It has, like most other camps, experienced a regular ebb and flow from the time of the first discovery of the mines, and in fact this is the history of every mining camp, however rich. All summer, while the valley has been attracting so much attention, the mines at Organ lay dormant to outside appearances, but a few men were still delving the great hills, and now it seems that the eve of prosperity has come to reward them for their faithful labors."

The Stephenson, which has been locked in litigation, is about to be reopened. Among other good mines are the Bennett, Little Rock, Crescent City, Black Prince, Grey Eagle, Copper Duke, etc. Prof. Chas. Longmense, ore-buyer for the Rio Grande Smelting Co. (Billing) thinks the Organ one of New Mexico's most productive ranges, and looks for future strikes of considerable magnitude and steady yield. The lead deposits to the north will in time be developed and prove of great value. To take it all in, the camp is in as healthy a condition as it has ever been since it has been under his notice."

The *Shaft*, published at Kingston, speaking of that camp says: "Our mines generally never looked better. The Caledonia, Comstock, Black Colt, and in fact the entire Bonanza hill and the North Percha country never looked better. Even the Grey Eagle keeps 'coming up.' It is true that mines are often found by accident. Nature has been lavish of her rich stores in our chain of mountains, and whether the existence of valuable mines is the result of accident or patient prospecting, the fact has been established that a large mineral belt exists many miles in length and of considerable width in which rich ore deposits exist."

This Black Range belt, which includes the mines in the vicinity of Kingston, has been ascertained to be nearly 50 miles in length, and to be nearly continuous the whole length."

The Lake Valley mines are situated at the southern extremity. These mines have produced several million dollars. Then passing the Tierra Blanco, where the recent strikes have been made, the Trojillo to the Grey Eagle on the South Percha, and passing the Enterprise group to the Carbonate, Midnight, and others, on the Middle Percha, adjoining the Illinois and Brush-heap group; the Louisville, Ironad group, the Eclipse and Satisfaction then follow in direct line on this belt. The Uncle Jack and General Jackson, which have produced good ore, at present are the connections belonging to the ore-producing formation. Then follows the Iron King, a good producer. Here are the Miner's Dream, Mountain Chief, Black Colt, Comstock, Lady Franklin, Caledonia, Superior and others."

As to the mines of Grant county the *South-west Sentinel* has this to say: "This year starts off very encouragingly as far as the mines of Grant county are concerned. In nearly all the camps of the county great activity is being displayed, and especially is this true of Pinos Altos. The prospect that the Santa Rita copper mines will start up adds to the encouragement which is shown in all parts of the county. Mines which have been idle are being started up under the lease system, and considerable prospecting is being done by conservative miners. The additions which have been made to the facilities for treating ores in this county during the past year are deserving of notice, and show that there is being rapid progress made in the development and working of the mines of the county. The capacity of the plants in the county has been increased nearly one-third within twelve months, and the end is not yet. There appears to be little difficulty now in getting capital interested where it can be demonstrated that there are good properties which will pay."

"There was a time when no inducements which could be offered would persuade capitalists to invest here, but that time is past, and inquiries are being made for good properties. The sales which have been made recently show that confidence has, in a measure, been restored, and unless that confidence is abused, there will henceforth be little difficulty in selling properties which are really good. The interests of the county demand that an end shall be put to mining schemes, the sole object of which is to beat Eastern capitalists and discourage them from further investments in New Mexico. Our mineral resources are practically without limit, and it is to the mine that we must look for the principal source of prosperity for Grant county. It is to our interest not to kill the goose which lays the golden egg, which is daily increasing in value. The outlook is very flattering now, and the increased activity in mining circles is sure to make itself felt in a financial way throughout the county before the summer months are here."

## OREGON.

A very complete review of mining operations in Oregon was written by Mr. Herbert Lang for the *Oregonian*. No new districts have been discovered, but development work has been very vigorously carried on. Portland people are taking some interest in mining, and smelting works have been established there. Capitalists of that city have been investing in mines of their own State and those of Idaho and Washington. The quartz and placer interests of Southern Oregon have not shown very encouraging results. Extensive veins of low-grade free-milling quartz exist, and there is a great area of country unprospected, but reduction facilities are wanting. There are only two quartz-mills in Jackson county. The Galia creek placers in Josephine county keep about 50 men at work. There have been no enlargements of the mining industries of Douglas county. Developments to considerable extent have been made on a ledge on the headwaters of Sucker creek, an affluent of the south fork of the Coquille river, at the southeastern extremity of Coos county, where the common angle of Josephine and Douglas counties ensues. The claim is being prospected, it is said, with encouraging results. On Sixes river, in Curry county, a promising placer claim has made a very fair output, it is said. The black sand mines along the coast have kept up their yield in several cases, but the interest of their working chiefly centers about the new processes for working the sands, a number of new inventions having been tried this year. Their success was not great in most cases, nor is it likely to be so long as inventors persist in clinging to the old and impracticable principle of forcing the sand through quicksilver."

The region on the western slope of the Cascades is being prospected more vigorously than ever before. There are mines in the Santean district but no mills. There are 50 men in the Blue River district. The experience of quartz miners during 1887 in Grant, Union and Baker counties has been, on the whole, very favorable, perhaps more favorable than ever before. There have been two or more pronounced failures—failures, too, where the mines were wholly in fault; but, on the other hand, there have been several successes, to more than balance the account. There has been improvement as much in the modes of working as in the value of the quartz found, and, to all appearance, there has been a general letting-down to business. Especially is this true of Pine creek."

Operations at the Bonanza mine, 35 miles west of Baker City, gave, last winter, a hope of great results, which have not been achieved. In this case the investor had the benefit of the wise professional skill of Prof. Clayton and Mr. Gilchrist, gentlemen of experience and probability. The 10 stamp mill which was erected to work the ore is described as of most excellent construction and design. The permanent workings of the Bonanza, a leased claim, are said to be also miracles of engineering skill, reflecting credit upon the designer. The expense of mill, underground work, tramways, etc., footed up \$30,000, the result being the most complete equipment possessed at that time by any mine in Oregon. The crushing began with *celat* and continued for some days, when, the pay rock being exhausted, the mill shut down."

The Eureka-Excelsior at Cracker creek will probably have a 40-stamp mill this year. Of developments at Rock creek, Silver creek and other newly-discovered regions of the Blue mountains the most encouraging reports are received. The work done thus far in both these localities has been very satisfactory and it is very likely more extensive operations may be in store for next year. The Chloride mine has begun shipping ore. The Tabor & Tracy mine in Granite district is reported to be "in bonanza" and the mill has been enlarged from five stamps to ten. The Bradley mine at Sanger, Union county, has been crushing from 14 to 20 tons per day, with much more rock in sight. There is a ten-stamp pan-mill and the rock is said to average \$45 per ton. The property belongs to the C. F. Bradley Mining Company, who have spent \$100,000 in the claim, etc. A mill is proposed also for the Golden Monarch mine in Granite district. The Worley mine in the same neighborhood, owned by Wolfe and others of Baker City, is said to have been sold lately. It contains some exceedingly rich ore, some of which has been crushed at the Bonanza mill."

Among the most important mining operations now proceeding in Oregon are in connection with certain of the Pioce creek mine, owned or controlled by the Oregon Gold Mining Company of Louisville, Kentucky. The affairs of this organization are administered by Prof. Luce, under whose direction the Whitman mine and several other claims near Cornucopia have been opened. The company's expenditures for two years past on these properties are said to aggregate \$200,000, including the cost of the very complete and perfect 20-stamp mill which began operations over a month since. More or less work is being done on several claims at Pine creek. Prominent among them are the Norway, Red Jacket, Union, May Flower, Last Chance, Way Up, Whitman, Forest Queen, Stella, Queen of the West, Red Boy, Mountain Chief, Companion, May Queen, Contact, Pine Creek, Star of Evening, Conundrum, Robert Emmet."

Notable discoveries have been made in Walla walla county, which promise well. The district is easily accessible. The silver ore from some

of the mines gives very good assays. The width of the mineral belt at Wallowa is as yet undetermined, but it is estimated at six miles. A very full description of the region, written by Mr. Leigh Harnett, has appeared in the *Oregonian* of recent date. It is said that tin and zinc exist near at hand. Another remarkable discovery in the region is the marble, of which several varieties have been shown to the writer. The different varieties are found in Hurricane gulch, one mile and a half from Joseph. The marble is evidently of excellent quality. Some reference to this region was made in the *PRESS* last week."

## UTAH.

The Utah mineral product remains about the same as in the year 1886. While it produced in 1887 48,456,260 pounds of refined lead against 45,678,961 pounds the year before, it only sent away 208,800 pounds of refined lead in 1887 against 2,500,000 pounds in 1886. There appear to have been no very remarkable developments in the Territory during the past year. Utah has some very high mines that yield largely, but it does not appear to have very many small ones that are producing. This would, in a measure, indicate that where capital has been invested in properly developing good mines they have been made very profitable. Utah is such a heavy producer of lead that there is some nervousness there now as to the possible action of Congress with relation to the tariff on that metal. The Territory is also a large producer of coal, iron, salt, and sulphur, and some other mineral substances."

The Salt Lake *Tribune* presented an excellent review of mining operations in that Territory, from which we condense the following information: In speaking of the smelting operations the *Tribune* says that the six or seven furnaces in blast the past year smelted 65,500 tons of silver ores and 34,000 tons of fluxing material, using 27,000 tons of fuel, and running out 13,000 tons of lead hillion, worth in Salt Lake—lead, an average for the year of \$50 a ton, silver 94 cents an ounce—\$178 per ton, or \$2,300,000."

The items of cost were as follows:

Article.	Tons.	Per Ton.	Total.
Iron ore.....	9,513	\$ 4.50	\$ 42,809
Limestone.....	24,920	1.75	43,608
Scrap iron.....	60	6.00	360
Colorado coke.....	15,728	13.00	204,464
Charcoal.....	1,680	13.00	21,840
Coal.....	7,503	6.00	37,516
Coal slack.....	1,374	3.00	4,122
Wood (corded).....	800	4.00	3,200
Labor, 270 hands, \$65 per month.....			212,621
Total.....			\$570,739

About \$8.70 per ton of ore smelted. The operations for the past year at the great Ontario mine have been confined to mining and milling. No new works have been undertaken and no new levels opened. The mine produced 37,176 tons of ore in 1887. The mill reduced approximately 27,930 wet tons, 23,834 dry tons, obtaining 1,093,938 ounces fine silver, which sold for \$1,045,205. Besides this, 10,834 wet tons, 9747 dry tons, were sold to the smelters for \$783,665. This ore contained 966,613 ounces fine silver. The company realized 141 per cent less for this ore than as though it had been reduced in the company's mill, against which of course must be set off cost of transportation to smelters, smelting and loss in smelting. The company obtained from ores reduced and for ores sold a total of \$1,823,870, of which it disbursed \$900,000 in dividends 123 to 139 inclusive. The year's work brings the total output of the Ontario to about \$19,300,000; total of dividends to \$8,825,000. The plant of mine and mill has cost \$2,570,000. The payrolls of the company carry from year to year an average of 400 men, at an average wage of \$100 each per month. There are still five or six years' work, Superintendent Chambers thinks, above the tenth level. The property never was in better condition than now."

The Daly ground, 1500 feet in length, joins the Ontario on the west. It is higher, so that the sixth level of the Ontario becomes the eighth of the Daly; several of the levels of the two mines have been connected. The Daly shaft is 3200 feet west of the Ontario No. 3, and rests at the eighth level, above which there is still two years' work. The sixth level drain tunnel of the Ontario takes the water of the Daly to the eighth level. Some of the Daly levels have been opened to the west end of the ground. The mine has a good hoist and the men are well housed. Its output the past year was about 25,418 wet tons; 22,178 of which were reduced at the company's mill (Marsac), yielding about \$710,035, 3240 tons were sold for \$262,853; making a total product of \$972,918, out of which \$300,000 was paid in dividends Nos. two to nine inclusive. The mill is at Park City. It has 30 stamps, with proportionate pans and settlers, Stetefeldt furnaces, revolving drives, retorts and furnaces, water rights, hydrants in case of fire, shops and necessary buildings, electric light, woodyard—all together a model mill."

A number of groups in the vicinity of these properties are being got in shape, titles settled, etc., in the belief that the ridge clear through to Big Cottonwood is good ground and contains parallel veins. Perhaps there is no place in Utah which offers greater inducement to the miner with money at command than the great ridge between Sawmill gulch and the Big Cottonwood."

On the Massachusetts, operations are very carefully conducted and occasional good hunches of ore are found. In the official reports of this company for the

past year, it is stated to have sold 1856 tons of first-class ore, and 3950 tons of concentrates, for \$150,922. Against this ore is charged a total expense of \$114,865, about \$19 a ton, \$5 of which is on account of concentration, leaving a profit of \$6.21 per ton. In 1884 the profit was \$6.52 per ton. The 3950 tons of concentrates represent upward of 20,000 tons of crude ore. The concentrating mill, in Park City, is connected with the mine by tramway, which rises 2000 feet in five miles. The property comprises 90 acres, the ore occurring in a zone, sloping with the hill, and about 100 feet below the surface. Probably 80,000 tons of ore have been extracted and sold, realizing to miner and smelter \$1,200,000, \$15 per ton; \$210,000 have been paid in dividends. Many thousands of tons of concentrating ore yet remain in the mine and on various ore dumps.

The mines of Salt Lake county are at Bingham canyon and on the Cottonwoods. About a thousand tons of ore came out of Little Cottonwood the past year, contributed by 15 or 20 mines, the leading shippers being the City Rock, the Josh Lawrence, the Albion and the Golconda. Prospecting for new ore bodies to the depths of the New Emma, the Flagstaff and the Eclipse has been kept up during the year, as it has for several previous years. These are all on the Emma belt or zone, the Eclipse being on the Big Cottonwood side of the divide. A good deal of deadwork has been done on other mines above and below the Emma belt, the practical results of which will appear in coming years. On the Big Cottonwood the Maxwell completed a long working tunnel in September, striking the ledge at a great depth, and much facilitating operations in the mine, draining it and enabling the ore to be taken out of the bottom instead of the top of the hill. The ore of the Maxwell is a very good article, selling for \$50 to \$70 a ton. About 500 tons were sent down the last quarter of the year.

#### Bingham Canyon.

Shipments of ores from Bingham the past year were approximately as follows:

Mine.	Tons.
Brooklyn	6900
Lead	3500
Jordan	3000
Old Telegraph	2600
Dixon	2400
Wienamuck	2200
So. Galena	1700
Spanish	1300
Yosemite	1300
Total	24,000

And about 7000 tons additional in the aggregate by the Rip Van Winkle, Lucky Boy, Silver Shield, Yosemite No. 2, Nast, Tiewaukie, Utah, York, Sacred, Last Chance, Bonanza, Aladdin, Badger, Alameda, Wasatch, Neptune & Kempton, and a few others, making in all about 13,000 tons; for the county, about 32,500 tons.

On the whole, the outlook for the district is much better than a year ago, with the exception, and it is a very serious one, that Bingham ores got a very black eye from the smelters the past year. But for that, with the high price of lead, the prospects of the district would be exceedingly bright.

At Tintio, the Eureka Hill shipped 11,000 tons of ore in 1887, about the average of its yearly shipments the last four years. The ore carries 5 to 15 per cent of lead, \$1.60 in gold, and enough silver to bring the value of the contents, exclusive of loss in treatment, to \$75 a ton. Deduct from this \$2.50 for hoisting and sampling, and \$23.50 for cost of transportation—it all goes East to be smelted—and one arrives at the Salt Lake value of the ore. Now, deduct cost of mining, inclusive of interest and wear and tear on mine plant and deadwork, and the net profit to the owner of the mine is obtained. In this case it can scarcely be less than \$30 to \$35 per ton. The litigation with the Beck and Bullion restricts the freedom of both deadwork and ore extraction. Shipments were suspended near two months in the summer while additions were made to the mine hoist.

The Beck and Bullion mine is also restricted in its operations by the litigation pending between it and the Eureka Hill. Yet its output for 1887 was near 6000 tons of 70-ounce ore. The ore, about 400 tons a month, is coming from the second and fourth levels. From the fourth level a winze has been sunk 40 feet in a body of ore, 15 feet wide at the widest and 45 feet long at the longest. The bottom of the winze is still in good ore. The ore at present carries 10 per cent lead, \$4 to \$5 in gold, and 70 ounces in silver.

Judged by their output, the other well known mines of Tintio have been worked but feebly the past year. A score of them have shipped a little ore, but less than 50 tons each on the average. Probably this was mainly by lessors who were contented with a sufficient output to give them a living. A few tons came from West Tintio, and a new district, four or five miles east of the Salt Lake & Western R. R., and six miles north of Eureka Hill, has contributed somewhat to the output of Juab county. Some of the ores are very rich in lead and poor in silver, while others run with the ordinary ores of Tintio. The importance of this new field it is yet too soon to determine.

Shipments of ores from Tintio for the year were approximately as follows:

	Tons of ore.	Approx. value.
Eureka Hill	11,000	\$825,000
Beck & Bullion	5,600	390,000
Mammoth	3,500	210,000
Northern Spy	1,000	60,000
Other mines	1,800	125,000
Totals	23,000	\$1,610,000

The value stated is that of the contents of

the ores, where they find their ultimate market in the East. The Salt Lake value would be less by at least \$25 per ton of ore. The Tintio Iron Co. shipped about 11,000 tons of iron ore, worth at the smelters about \$50,000.

The outlook for the district is better than at any previous time. The area of mining is enlarging, the success of the leading mines is stimulating prospecting and development, while the prices of the metals produced, with the exception of silver, rule higher than for a long time, and the rise does not appear to be largely speculative, but underlain by sufficient cause—either reduced production, increased consumption or both. It looks as though the raid on silver had about exhausted itself, too. The producing mines of Tintio district are as follows: Eureka Hill, Bullion-Beck, Mammoth, Gemini Con., Tintio Iron, Tintio, American Eagle, Mountain Chief, Silver Coin, Tesora, Centennial Eureka, Eureka No. 5, Stubbs, Sunbeam, Showers Con., King James, De Prizen Eureka, Wind Ridge, Park, West Tintio, Susan, Kappes, Red Bird (S. Ex. Showers), Etella, Sunbeam, Treasure, Sunbeam No. 2.

During the past year the Christy mill at Silver Reef worked 14,000 tons of ore, producing 235,771 gross ounces silver. This makes their sandstone ore average about \$16 per ton. The company own 26 mines, but only operate two, the Stormy King and California, which furnish all the ore necessary to keep the mill running. The mill has only five stamps, which reduce 40 tons of the easily-worked sandstone per day. The best ore bodies of the Stormy King are on the 600-foot level, but there are good stopes on the 4, 5 and 6 levels. The California mine is 800 feet deep and has a large body of good ore on that level. These mines show permanency, and are now, as in the past several years, regular producers. The property belongs to a close corporation of San Francisco men, and has for its local management R. T. Gillespie, who has been with the company a long time.

The Stormy mill was closed most of the year, but lately started to run through custom ores. It can treat ore cheaper than the Christy because using water-power while the latter uses steam. It reduces ores taken out by "choloriders" at such low prices as to have started a revival of business among this class of lessors. The mill is operated by the water of Virgin river. The mill reduces 20 tons of ore per day. Besides the two mills, there are leaching works which run part of the season and turned out 38,785 ounces fine silver. The figures given as the output of Christy bullion was gross ounces. Putting this down to fine ounces, the total output of the camp for 1887 was 152,341 12-100 ounce fine silver. The year closed with the prospects some brighter than the opening, as far as the mining industry goes.

#### WASHINGTON TERRITORY.

Washington Territory has never been greatly noted for its mines of precious metals, and the production has only been about \$100,000 to \$200,000 per annum. But of late some fine discoveries have been made in the Salmon river region, and mines are being opened in several places. Capital has become interested and developments will be more systematic. Two towns—Ruby and Salmon—have sprung up in the new mining region, and at least a quarter of a million of dollars cash has been paid for mining property in the districts. The winters there are short and by the end of February the "boom" is expected. The Arlington, the most prominent mine, has a lode some eight feet wide. Assays from some of the mines are quite high. Among the prominent mines are the Keystone, Fourth-of-July, First Thought, Ruby, Lemore, Anconda, Fairview, Lenore, War Eagle, and Missing Link. Some of these are under bond now. The country is being rapidly settled up. These mines are really on the Concomally, a tributary of the O'Kanagan river, though they are known as the Salmon river mines. The ores carry silver exclusively.

Troopers who arrived in Ellensburg from Lake Chelan inform the Capital that prospectors have been prospecting the mountains along the shores of that lake all summer and fall and have met with success, so much, in fact, as to induce them to put in the winter developing their prospects. The ore is similar in character to the Salmon river ores, and the veins are quite extensive, carrying gold, silver and lead. The troopers describe the lake as being over 60 miles in length, and in width from one to four miles, surrounded by rugged mountains, while the depth is from 100 to 1000 feet, and abounds with fine, large silver trout, from one to two feet in length. There is plenty of game, consisting of bear, deer, elk, moose and wild goats. The elevation of the lake above sea level is 500 feet and the climate is mild, with but slight snowfall. Ranchers have taken up ranches at the lower end of the lake and are making a comfortable living. The trappers describe the country as simply grand.

During the Mechanics' Fair at Portland last year a lot of minerals from Kittitas county, W. T., were exhibited. Included in the lot was a sample of coal taken from a car laden at the Roelyn coal mines of the Northern Pacific Coal Company, three and three-fourths miles from the main line of the Northern Pacific at Cle-elum junction. The coal field is four by thirteen miles in general extent, and is thus far known to be underlain with three distinct veins. It is an excellent steam and gas article, will make second-class coke, and is a fair black-smithing coal. The output is 400 tons daily,

and rapidly as possible the production is being increased. Outside of the limits stated a very large area of coal-bearing formation is as yet unexplored.

The specimens of iron ore sent were samples of the outcrop of the Uncle Sam and Iron Heart mines in the Iron Mountain District. The mines are three miles south of Cle-elum Junction, main line of the N. P. R. R., Kittitas county, W. T. The Uncle Sam shows 11 feet of ore at the discovery, and 800 feet therefrom the Iron Heart shows six feet and six inches of ore. Some 15 mines are grouped in the immediate vicinity, and a practically unlimited supply of brown hematite and magnetite iron ore will be drawn from this group of mines from this time forward. The Moss Bay Iron and Steel Company of North Cumberland, England, has determined to locate a Bessemer steel manufacturing plant, employing 2000 men at or near the Cle-elum Junction, and its representatives are engaged in buying the surrounding mines. American steel and iron workers are expected also to enter this new and extensive field.

The copper-silver ore was from the Bullion mine in the Cle-elum district, situated north and west of the coal-field, some 20 miles from the Cle-elum Junction. An immense mineral lode traverses the entire district showing one of this character. Extensive iron and lime deposits are found between the coal and copper belts, and a railroad to develop the latter has already been decided upon by the Northern Pacific. Surface indications show the copper-silver deposit to be equally extensive with the coal and iron.

The gold and silver samples represented in a general way the output of Cle-elum and Peshastin districts mill-ores. Assays run from \$25 to \$400 gold and silver per ton. Much of the Peshastin rock has been worked by free-milling process, and has yielded \$10 to \$100 in free gold, with concentrates sampling \$80 to \$250 per ton. With development and equipment of the adjacent iron and lime deposits of the Cle-elum district, ample facilities will be afforded for the proper working of these ores.

A smelter has been erected in the silver lead district of Colville to work custom ores. The capacity is 25 tons per day. More or less mining is being done at Chewelah. There are several other scattered districts in the Territory. The claims about Caledonia and Metaline, where the silver ore is low grade, have not been actively worked. Embrey, Peshastin, Swan and others are placer districts. The whole Territory is in need of reduction works, but it is confidently expected that this year its production of precious metals will be much larger than ever before.

The coal and iron mines of the Territory are important. Neither of these substances is very abundant on this coast, and the owners of these mines, when they properly develop them, are sure of a good reward.

#### Minersville, Utah.

EDITORS PRESS:—Mining in Beaver county, Utah, has been the past six months comparatively at a standstill. Tribute miners of North and South Star and also from the once famous Cave mine, keep sending occasionally carloads of ore to Salt Lake smelters, the Martin Bros. and the Horn Silver Co. of Frisco also adding their share. Though we have two smelters and two mills in the county, none are receiving. The Monte Cristo mill of seven stamps, owned by J. H. Dupaux, is starting up next month. Mr. Dupaux will also work his own and custom ores. It is a water-power mill situated 1½ miles east of Minersville, on Beaver river, and has a good future before it. There are four mining claims connected with the mill, yielding ores worth from \$15 to \$50. Three of them lie in a group and are patented. They are developed by tunnels and inclines. One of them is one mile distant from the mill. The claims are all owned by the same party.

Lincoln mining district, some 3½ miles from the Monte Cristo mill, has of late made considerable progress in opening up veins of galena ores, and will eventually come again to the front. Many patented claims are held by Eastern stock companies. Northeast of this is the Granite district, having galena ore and bluish veins, at present held by the owners, awaiting railroad facilities and nearer reduction works.

J. H. DUPAUX.

Minersville, Utah, Jan. 23d.

#### Mining Share Market.

There is little activity in mining stocks, but there is great activity in mining along the Comstock lode from the Utah to the Alta, and more ore is now being extracted and shipped for reduction than has been done on the Comstock in 15 years.

The Enterprise says: The demand for greater milling facilities is imperative, and will surely be met in the near future. Savage and Hale and Norcross are suffering materially on account of the lack of milling facilities. Justice is crying for a mill. The Yellow Jacket people need more and better milling power, and they will get it.

Following is the milling power of the Comstock: Mexican, 44 stamps; Brunswick, 76; Vivian, 16; Santiago, 25 only are fit to use; Morgan, 40; Eureka, 60; Rock Point, 20; Gold Canyon mills, 30; Six-mile Canyon mills, 30; Alta, 10; Nevada mill, 40; Battery mill, 80; total, 503 stamps. If stamps average three tons each daily by the month they are doing well, counting hanging up for repairs, etc. This gives us then a crushing capacity of 1,449 tons of ore daily when they are all in full blast.

Totals	2,491,320	2,500,000	45,078,961	2,112,461	4,049,273	10,714

#### RECAPITULATION.

2,491,320 lbs. Copper, at 5 cents per lb.	\$124,566.00
2,500,000 lbs. Refined Lead, at 4 1/2 cents per lb.	111,750.00
45,078,961 lbs. Unrefined Lead, at \$2.40 per ton	1,106,788.77
6,101,737 ozs. Fine Silver at \$0.07 per oz.	5,076,844.89
11,373 ozs. Fine Gold at \$20 per oz.	227,440.00
Total Export Value	\$7,637,729.86

Computing the Gold and Silver at their mint valuation and other metals at their value at the seaboard, it would increase the value of the product to \$10,604,631.

Comparative Statement, showing the quantity of the Silver and Gold contained in base bullion produced in Utah:

YEAR.	Total Ounces of Silver Produced.	Total Ounces of Gold Produced.	Ounces of Silver in Ores and Base Bullion.	Ounces of Gold in Ores and Base Bullion.	Per Cent of Total Silver Product.	Per Cent of Total Gold Product.
1878	4,357,323	15,040	2,108,339	10,105	48.3-10	67.5-10
1879	3,835,047	15,932	1,797,589	5,093	46.8-10	35.7-10
1880	3,783,506	9,020	1,403,819	2,378	37.1-10	35.8-10
1881	5,400,111	7,958	2,643,899	2,622	48.9-10	32.9-10
1882	5,435,444	9,039	2,581,780	5,016	47.3-10	55.6-10
1883	4,531,703	6,991	2,351,190	5,397	51.8-10	80.
1884	6,069,488	6,539	3,253,084	3,806	57.4-10	68.8-10
1885	6,072,630	5,003	3,189,576	7,259	53.4-10	81.8-10
1886	6,018,942	10,577	2,538,203	8,389	47.0-10	79.1-10
1887	6,101,737	11,357	4,049,273	10,714	65.7-10	94

Comparative Statement of the value of lead bullion, including silver and gold necessarily produced in its manufacture west of the Missouri River, compiled from the annual reports issued by John J. Valentine, Vice-President and General Manager, Wells, Fargo & Co., San Francisco.

YEAR.	Total Value of Precious Metals, including Lead.	Total Value of Lead Bullion, including Gold and Silver Contents.	Per Cent of Entire Product.
1870	\$75,340,501	\$19,234,394	25.5-10
1880	80,167,936	28,114,564	35.
1881	84,504,417	30,253,430	35.8-10
1882	92,411,335	39,708,750	38.7-10
1883	90,313,612	34,810,022	38.6-10
1884	84,976,054	31,101,250	36.7-10
1885	90,181,203	35,731,711	39.6-10
1886	108,011,701	44,635,655	43.3-10

The above statement shows a marked annual increase in the percentage of precious metals produced in the manufacture of base bullion. It demonstrates conclusively that the process of smelting is in the ascendant for the reduction of ores, and that any causes tending to decrease or discourage the production of lead will produce a corresponding decrease in the gold and silver production west of the Missouri River.

**STURTEVANT MILL.**

This Mill as a Crusher and Pulverizer is without rival.  
Is in operation in lead-  
ing smelting works  
and mills.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and  
high heads are utilized, and are guaranteed to give more power with less water than  
any other wheel made. Being placed on horizontal shaft, the power is transmitted  
direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in  
capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the  
ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost,  
by applying to the manufacturers.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patentee and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction. We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

PATENT

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Gunpowder Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

JOHN TAYLOR & CO., Sole Agents,  
 Cor. First and Mission Sts., San Francisco.

Send for Descriptive Circulars containing Testimonials of well-known parties who are at present using them.

## QUARTZ SCREENS

A specialty. Round, slot or barrel slot holes. Genuine Russia Iron, Homogeneous Steel, Cast Steel or American planished Iron.

Zinc, Copper or Brass Screens for all purposes. California Perforating Screen Co., 145 & 147 Beale St., S. F.

## Practical Treatise on Hydraulic Mining.

By AUO. J. BOWIE, JR.

This new and important book is on the use and construction of Ditches, Flumes, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdy, rockers, undercurrents, etc.; also describes methods of blasting, tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by Dewey & Co., Publishers, 252 Market St., San Francisco.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

THE production of copper in the United States for 1888 may reach 200,000,000 or 210,000,000 pounds.

## MINING AND SCIENTIFIC PRESS.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JANUARY 17, 1888.

376,467.—PAWL AND RATCHET MECHANISM—R. J. Ballew, Magalia, Cal.  
 376,425.—SPRING VEHICLE—A. Bink, Stockton, Cal.  
 376,426.—INKING ATTACHMENT FOR PRINTING PRESSES—J. R. Brodie, S. F.  
 376,468.—FENCE-POST TIGHTENER—Levi Brooks, Black Diamond, W. T.  
 376,577.—CAN-OPENER—H. Bruckerman, Table Rock, Cal.  
 376,519.—PACKING CASE—Jos. Davy, Oakland, Cal.  
 376,437.—RUBBER DAM CLAMP—J. H. Haich, S. F.  
 376,651.—CHIMNEY—B. F. Hentz, S. F.  
 376,558.—METHOD OF FITTING GARMENTS—E. Stahl, Prescott, A. T.  
 376,565.—TAMPING TOOL—Waldron & Bolter, Folsom, Cal.  
 376,569.—TELEGRAPHIC APPARATUS—S. B. Whitehead, S. F.

FOR WEEK ENDING JANUARY 24, 1888.

376,735.—WEED-CUTTER—Denehy & Childs, Acamp, Cal.  
 376,739.—SAMPLE TRAY—D. Goldstein, S. F.  
 376,804.—CAN-CRIMPER AND CAPPER—M. Jensen, Astoria, Ogn.  
 376,755.—RAILWAY CROSSING—W. H. & R. T. Shannon, Stockton, Cal.  
 376,787.—FRICTION FIRE-ESCAPE—Smith & Olds, Helix, Ogn.

NOTE.—Copies of U. S. and Foreign Patents furnished by DEWEY & CO., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

WANTED—A first-class Gold Mine, or one producing Gold and Silver. Address, stating location, price, etc., F. A. B., Box 2361, San Francisco, Cal.

## LOW RENT AND FREE WATER!

160 Acres Rich, Level Land.

To some one who will cultivate well, will be furnished free water and use of 160 acres of good land (S. E. Sec. 13, T. 21, R. 23) with 9 miles of Tulare, S. W., for one-tenth of crop. Forty acres formerly plowed. Land on all sides cultivated and pastured. Water for irrigation, if needed, free. Also, the whole of Sec. 15, T. 23, R. 24, in arable belt; rent free, without water. For particulars call on E. M. DEWEY, 7 miles S. W. of Tulare, or A. T. DEWEY, 220 Market St., San Francisco.

## New York Metal Market.

Telegraphic advices dated Feb. 2d give the following New York prices:

BAR SILVER—95¢ per oz.  
 BORAX—95¢ per lb.  
 COPPER—LAKES—\$16.40@16.60.  
 IRON—No. 1, \$22.00.  
 LEAD—\$4.90.  
 TIN—\$36.90.  
 The following is the latest by mail from the "New York Metal Exchange Market Report":  
 COPPER—Dull, spot closing at \$16.90@17.20. Transferable Notices (Lake) issued at \$16.90@—.  
 LEAD—Quiet at \$4.92@5.00 spot. Transferable Notices issued at \$5.00.  
 TIN—Weak at \$36.80@37.10. Transferable notices issued at \$34.00.  
 MARKERS' PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50@21.00; No. 2, \$19.60@20.00; Grey Forge, \$17.00@17.50; Hudson River, Grade No. 1, \$20.50@21.00; No. 2, \$19.60@20.00; Grey Forge, \$17.00@17.50; Southern, Grade No. 1, \$20.00@21.00; No. 2, \$19.50@—; Grey Forge, \$17.00@—.  
 Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery.  
 Australian Tin, \$37.00@37.50; Billiton Tin, \$37.00@37.50; Banca Tin, \$—@—; Baltimore Copper, \$14.60@15.40; Orford Copper, \$15.25@16.60; P. S. C. Copper, —@—; Foreign Lead, \$5.40@5.60; Foreign Spelter, \$6.10@6.30. Antimony

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

**FRISBEE-LUCOP MILL COMPANY,**

GIDEON FRISBEE, Manager. - - - 461 Howard St., San Francisco.

**EDISON INCANDESCENT LIGHT,**

The only complete and satisfactory incandescent system. Lights require no attention and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

— THE —  
**DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**

Goes with each Mill. We also have a suitable

**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

Inventor and Manufacturer of

**Keith's Electric Dynamos,**  
MOTORS, LAMPS

—AND—

**Storage Batteries.**

Electric Railways, and Apparatus for the Electric Transmission of Power.

Dynamos and Motors of all sizes for Conveying Power from Waterfalls for use in Mines and Mills, erected under guaranty of performance.

Office, 40 Nevada Block,  
Factory, 11 Stevenson St. San Francisco, Cal.

# \$1,000 CHALLENGE!

**PRICE: FIVE HUNDRED AND SEVENTY-FIVE DOLLARS (\$575.00) F. O. B.**

OVER 1400 ARE NOW IN USE. Concentrations are clean from the first working. The wear and tear are merely nominal. A machine can be seen in working order and ready to make tests at 220 Fremont Street, San Francisco.

THE MONTANA COMPANY (Limited), LONDON, October 8, 1885.

DEAR SIR:—Having tested three of your Frue Vanners in a competitive trial with other similar machines (Triumph), we have satisfied ourselves of the superiority of your Vanners, as is evidenced by the fact of our having ordered twenty more of your machines for immediate delivery. Yours truly,

THE MONTANA COMPANY (Limited).

N. B.—Since the above was written the 20 Vanners having been started gave such satisfaction that 44 additional Frues and more stamps have been purchased.

ADAMS & CARTER.

Protected by patents May 4, 1879; December 22, 1874; September 2, 1870; April 27, 1880; March 22, 1881; February 20, 1883; September 18, 1883. Patents applied for.

**THE FRUE ORE CONCENTRATOR OR VANNING MACHINE.**

## RISDON IRON & LOCOMOTIVE WORKS

Location of Works, S. E. Cor. Beale and Howard Sts., San Francisco.

Manufacturers and Sole Agents for the Pacific Coast for

**HEINE SAFETY WATER TUBE BOILER.**

Has the Following Advantages:

**SAFETY, DURABILITY, ECONOMY,**  
AND FACILITY OF INSPECTION and REPAIRS.  
60,000 Horse Power now in use.

Boilers can be seen working in San Francisco at Palace Hotel, Spring Valley Water Works, Hueter Bros. & Co., California Jute Mills, and other places.

Guaranteed More Efficient than any other Boiler made.

**BUILDERS OF**

**QUARTZ MILLS**—Gold and Silver, Copper and Lead Smelting Works, Roasting Furnaces of all kinds.  
**AIR COMPRESSORS**—Rope Power Transmission.  
**HYDRAULIC PUMPING** and Hoisting Machinery.  
**WROUGHT-IRON WATER PIPE** a Specialty. **WORKS**—Have just completed order for 35 miles of 44-inch pipe of 4-inch iron for Spring Valley Water Works Company, San Francisco.  
**SAW-MILL MACHINERY** of all kinds.  
**STEAM ENGINES**—Corliss, Slide-Valve, Poppet Valve Automatic, Single, and Compound.  
**SOLE MANUFACTURERS** for Pacific Coast of the Celebrated "Heine" Patent Safety Boiler (Water Tube); 50,000 horse power now in use.  
**MACBETH PATENT STEEL-RIM PULLEYS**—Fifty per cent lighter and 25 per cent cheaper than cast-iron pulleys; will not break in transportation.

**REFRIGERATING MACHINERY** for Steamships, Breweries, and Cellars.  
**WILSON'S PATENT GAS-PRODUCER.**  
**STEAM BOILERS** of all descriptions.  
**SUGAR MACHINERY**—Sugar Mills, Vacuum Pans, Clarifiers, Double Effects, etc.  
**STEAMSHIPS**—Steam Yachts, Marine Engines and Boilers, Screw Propellers, Centrifugal Pumps, Steamship Pumps, Steam Capstans, Cargo Winches, etc.  
**BUILDERS** of 120-stamp Gold Mill for the Alaska Mill and Mining Company; 60-stamp Mill for Quartz Mountain Mining Company.  
Send for Circular and Price Lists.

## NOTICE TO GOLD MINERS! SILVER-PLATED AMALGAMATED PLATES For SAVING GOLD!

IN QUARTZ, GRAVEL, OR PLACER MINES. MADE OF BEST SOFT LAKE SUPERIOR COPPER  
FULL WEIGHT OF SILVER AND BEST QUALITY OF WORK GUARANTEED.

GET OUR PRICES BEFORE ORDERING ELSEWHERE. SAMPLES  
FURNISHED ON APPLICATION.

**SAN FRANCISCO NOVELTY AND PLATING WORKS,**  
No. 108 FIRST STREET.

NOTICE.—All our plates are guaranteed to have the full weight of silver agreed upon, and are tested before leaving our works, thereby avoiding the complaints about light weight, made so often before we started in this branch of industry.

## ATTENTION, GOLD MINERS!

WE ARE SELLING

### Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,

E. G. DENNISTON, Proprietor.

653 &amp; 655 Mission St., San Francisco, Cal.

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the Silver-plating, and in having much less Silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. SEND FOR CIRCULAR.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon Sulphurets and ores containing rusty Gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the WONDER and SURPRISE of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

## Workingmen's Homes.

In recent numbers of the PRESS we have illustrated several types of the homes of workingmen of different countries. In continuing this series we give engravings of the homes of the workingmen of Mr. Krupp, colony of the "Three Linden Trees," Essen, Rhenish Prussia. The houses he builds for workingmen are said by Mr. C. D. Wright, who wrote a special report on the subject for the Census Bureau, to be among the most substantial in Europe. The houses compare well with the men employed in the celebrated steel works. Herr Krupp, by his system of employment, has the selection of the best mechanics in Europe. This system comprehends all the advantages to be found in model industrial establishments, including excellent tenements and gardens at low rents. All the houses in the "colonies" just outside the town are owned by Herr Krupp; in fact, he believes that he receives better results by owning everything, and by being able thereby to control the sanitary surroundings of the dwellings of his people. These colonies, each having its name, are laid out with parks, schools, churches, supply-stores, etc.

The housing of single men at Essen is on the barrack plan, and is far below the American corporation boarding-house style of housing our single operatives. But the inspectors prevent the men from crowding themselves in tenements. They expel workingmen who live in too small tenements.

The houses for families are quite good. On this page are engravings of a couple of types of the class. The price of a group of four houses such as is shown is \$4185. The price for one house, including the land, is \$1046.25. The annual rent of two rooms, with a cellar, varies from \$20.93 to \$25.11 in a house with two stories. The rent of a house in this group is from \$37.20 to \$41.85 a year. The refuse matter is taken by the peasants of the surrounding country, who use it as compost. The roof is covered with tiles. The exterior walls are of rubble stone or ashlar; the interior partitions are of wood. The window-sills and stairways are of stone.

In 1876 Herr Krupp, to accommodate his workmen, constructed 3277 tenements, which are occupied by 16,700 persons. On account of the rapid development of his works he has been obliged to build houses with stories. They are obliged to give every family a separate entrance.

The engravings also show a group of two houses arranged for four families. In this group the annual rent of a tenement composed of four rooms is \$41.85. The employees of Herr Krupp pay their rent once in three months. The rent of the workingmen is regulated by reserves made from their pay, which is carried into effect every 15 days. The rent of widows is paid by the benefit societies.

It is reported that quite extensive works will be constructed this spring on the shore of Owens lake, east from Olanche, for the evaporation of lake-water and gathering soda. The ground is said to be much better there for the purpose than anywhere else on the shore of the lake.

THERE are 272,448 children between 5 and 17 years of age in this State. The State appropriation for school moneys is \$6.65 for each head, an aggregate of \$1,811,779.

**DISCOVERY OF DIAMONDS IN A METEORIC STONE.**—Professors Latschnef and Jerodief report the examination of a meteoric stone weighing four pounds, which fell in the district of Krasnoslobodsk, Government of Pensa, Russia, on September 4, 1886. In the insoluble residue small corpuscles showing

Australia. If this supplementary discovery be confirmed, we may at last be placed on the track of the artificial production of the precious stone.

At the Moomoth mine, 56 miles north of Tucson, on the San Pedro river, Prof. Price has

WORKINGMEN'S HOMES AT KRUPP'S STEEL WORKS, ESSEN.

traces of polarization were observed; they are harder than corundum, and have the density and other characters of the diamond. The corpuscles are said to amount to one per cent of the meteoric stone. Carbon, in its amorphous graphitic form, has been long known as a constituent of meteoric irons and stones; lately, small but well-defined crystals of graphitic carbon having forms often presented by the diamond have been found in a meteoric iron from

been doing some experimental work for a wealthy Eastern syndicate. If the work comes out well a large plant will be erected and mining conducted on a large scale.

**BANNER DISTRICT,** San Diego county, is about five miles east of Julian and about 1500 feet lower. There are several extensive gold mines here, the principal one being the Ready Relief.

## Size of Mining Locations.

Senator Stewart of Nevada has introduced in the Senate a bill to amend the mining laws of the United States, by providing that no person shall acquire more than one mining claim on the same vein or relocate a claim which he has previously located; and also requiring that each patent for mining land shall reserve the right of way through or over any mining claim for roads, ditches, canals, cuts and tunnels, for the purpose of working other mines, provided the damages occasioned thereby shall be assessed and paid for according to law.

Some of the States have laws giving right of way over mining claim for ditches, etc., but these laws are not universal, as they would be in case Senator Stewart's bill became a law.

The provision that "no person shall acquire more than one mining claim on the same vein" is somewhat obscure, as the telegraph gives us the wording. It can scarcely mean that one person shall not purchase adjoining claims on the same lode, and probably means he may not locate and take up two claims. As the law now stands, a person can only locate a claim 1500 feet long by 600 feet wide, but there is really nothing to prevent him taking twice as much ground as this providing he takes up two claims. If he does not want to do this in his own name, he uses another name for the second claim.

As a general proposition, the size of claims allowed is larger than need be. It is very seldom that the whole length of any of these lode claims is worked. Yet as the law allows the size mentioned, every one takes up that much ground.

If Mr. Stewart's bill will have the effect of putting an end to the custom of taking up a whole lot of ground which others might work, it would be a good thing. The dog-in-the-manger policy is followed too much in the mining regions. There are some people who are natural "hogs" in this respect. They get a piece of ground and want to hold half a county at each end of it to keep others off. It is to be hoped that this custom can be stopped by law, but we very much doubt it. People can get others to do the legal locating and then purchase the locations. The timber land laws only allow a man a certain acreage, but any individual with a little money has no difficulty in getting all he wants in one tract. It is pretty much the same in the mines. A mere location with a "notice" and a couple of piles of rocks for boundary monuments is cheap enough for any one to buy, and it is easy enough to get men to make such locations. It may be that when we see the full text of Senator Stewart's bill he has so worded the paragraph referred to as to obviate the difficulties, and it is to be hoped he has.

**JULIAN DISTRICT.**—This place was founded nearly 20 years ago as a mining camp, and at one time was the most populous town in San Diego county. It is situated about 50 miles northeast of San Diego, about five miles from the proposed line of the S. P. R. R., and is to be the terminus of the San Diego & Cuyamaca railroad. It is on the divide that separates the Pacific Slope from the interior basin, and its altitude is 4000 feet.

THE old copper mines in the Mount Diablo region, Contra Costa county, may be again opened if the price of copper continues high.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—Eds.

## Notes of Honduras.

EDITORS PRESS:—Honduras is not Heaven; that is my private opinion. I will not argue the point with any one who has not, as I have, qualified himself by a muleback ride, during the rainy season, over several hundred miles of the country.

To say that there is a great deal of land to the acre in Honduras would expose me to the charge of violating the ordinance against chestnuts, so I refrain, but would beg to remark that the country richly merits its name, and he who will journey therein may prepare himself for even more ups and downs in life than fall to the lot of the ordinary itinerant.

The most prominent physical characteristic of Honduras is lumpiness; it is not ridged and furrowed like Nevada; if it could be flattened it would occupy a much larger space than it now does on the map of the world, and the intention with which the President is credited, of remaining neutral in case of a war in Europe, might acquire greater significance than it seems to possess at present.

Yet Honduras cannot be called a very rugged country, the softness of the rocks, chiefly of porphyritic or clayey nature, precluding this usual feature of mountainous regions to a great extent; moreover, the surface, from the bottoms of the ravines to the summits almost of the lofty volcanic cones, as well as on the steepest acclivities of the innumerable humps and humps, and in the few and diminutive valley bottoms, which would scarcely rank as valleys in California, is covered with a dense growth of trees, vines, and brush, or with a coat of emerald-green grass. It is to the

## Luxuriance of Vegetation

That I ascribe the conservation of a rich soil, on the multifariously "tipilted" face of the country, which would otherwise inevitably be washed away by the copious daily rainfall during from six to eight months of every year.

It would be an error to suppose that the steepness of the country in general must preclude the raising of crops everywhere. Clearings are made by the patient people on ground which stands at an angle of 45 or more degrees, and good crops are raised thereon; but not a plow nor a grubbing-hoe disturbs the matted roots of the natural vegetation, the sole security for the stability of the *milpa* on the slippery and water-soaked bedrock. Even on the more level lands a plantation of coffee, tobacco, indigo, or what not, is scarcely distinguishable from the surrounding wilderness, of which, in fact, it usually forms but a modified portion. Only at one place, called Colual, I saw an orchard in which the ground between the regular rows of fruit trees was kept clear, as with us in California.

Some of the finest tobacco in the world is grown in the department of Copan; also coffee of similar good quality, so that the native of very moderate means may enjoy a beverage the equal of which cannot be got in San Francisco, and puff a cigar which would grace the lips of an American millionaire. From a gastronomic point of view, however, Honduras is at best not a brilliant success. It is true that in Copan our party fared pretty well, considering, but there was a good deal to consider; and those of us who went to Curaren nearly starved. There is a great and discouraging abundance of *no hay*, and a correspondingly plentiful lack of many things which, in our country, are considered as necessities of life. Yet we found that *no hay* was often a mere subterfuge, to save trouble, and by persistently ignoring that, and demanding what we wanted, we often got what we wanted. This hint is worth the attention of those who may contemplate a visit to the country.

## One Excellent Feature

Of Honduras is the *Cahilda* found in every village. This is a substantial and reasonably capacious house of one room which, though utilized as a schoolroom and courthouse, is at the disposal of any traveler who may need its shelter, peddlers being even permitted to display their wares in the inevitable corridor or veranda. The *cahilda* is in charge of the *alcalde*, whose duty it is to see that the temporary occupant is provided by the villagers with all obtainable necessities on payment of a just price. Even between villages where the distance is much beyond a day's drive, good sheds are erected for the use of the pack trains. We experienced the benefit of this humane and liberal institution on many occasions, there being no hotels in the smaller villages or towns.

## The Facilities for Travel and Traffic

Are extremely poor. It may almost be said that there are absolutely no roads in the country; at least I saw none, and only heard of 18 miles of decent road, near the capital, the cost of which nearly bankrupted the National treasury; nor is this very surprising when it is considered that there are not so many people in all Honduras as there are in San Francisco, and there is an army, a president, a congress and a host of officials to be supported and paid, while the people in general are extremely poor. Trails there are in bewildering variety and pro-

fusion, so that a guide is a necessity in traveling, and even guides sometimes lose their way.

## The People of Honduras

Resemble the Mexicans in their general characteristics and style of living, building, etc., but seem to be more honest and amiable. Exorbitant charges are infrequent, and it is nothing unusual to intrust a common workman or servant with the carrying alone through the labyrinthine wilderness of this most intricate country, of hundreds of dollars in specie, which he is sure to deliver with punctilious exactitude to the proper person, from whom he exacts a written receipt. This man probably earns about 30 cents a day, and I have known such a messenger to deliver his charge faithfully where a deviation of two leagues would have put him over the frontier and in a different country.

In other respects the morals of the country are such as we, with our customary assumption of virtue which as a community we do not possess, should call "shocking," though, as a matter of fact, if our detectives are to be believed, the natural sins of Honduras are as nothing compared with the grotesquely horrible debauchery of the Queen City of the Pacific, to say nothing of the ordinary—very ordinary—immoralities which are or are not Chronicled, Examined, Called and Posted daily among us.

Many of the women of Honduras seem to be widows by courtesy—that is, unmarried, deserted mothers—who, to an inquiry for their husbands, will answer that they are dead, though many of them frankly confess that they were never married, and seem to attach no undue importance to the fact.

In outward deportment at least—and that counts for something—the women of all the Spanish-American peoples, so far as I have observed, are modest and reticent. I have never known one of them, even of the avowed *hetera* of a town, to accost a stranger or make immodest overtures. But it goes between the pathetic and the ludicrous to see how the mothers and other female relatives watch and guard the young girls, with the almost invariable result that the girls follow in the paths which their mothers have trodden, or perhaps those same mothers may sacrifice them for some object, pecuniary or otherwise, of their own, while the daughters themselves are frequently not unwilling victims. The girls of Honduras are remarkable for good physical development. The practice of carrying vessels of water on the head, which among the poor is a part of a girl's daily task, the absence of crippling shoes and deforming corsets, the simple food and freedom from exhausting toil, the grinding of corn by means of the *metate*, and the constant ascending or descending of hill or mountain, give to their bodies the natural grace which comes from strength combined with suppleness. As to legs and hips, they would be the envy and despair of Market street, without the adventitious aid of old newspapers or wire trapings (trape). They are magnificent breeders, too. It is no uncommon thing to see a matron, yet on the right side of 40, who is the mother of a couple of dozen, and grandmother to a lot more.

The little girls are generally pretty, as are also the boys; the former, on reaching womanhood, are still attractive, but in maturing they usually run either to hump or to blubber. Their faces bear, more or less, the stamp of ignorance and mental torpor; they have an unpleasant habit of spitting without apparent cause.

The men, in youth and early manhood, are generally good-looking, almost always pleasant-appearing. Taking the people all in all, I like them.

Many consider these people lazy. I do not; but they are philosophical in a certain way. They will work hard and do the best they know how, and are not slow to learn; but they will not sacrifice themselves to excessive toil for the sake of a trifling and temporary gain, nor to gratify the restlessness or greed of the stranger who usually damns them for not knowing what they never had occasion to learn and condemns them because their ways are not his ways, their cleanliness is not his cleanliness (they wash a chicken with soap and water and shave it with a *machete* for cooking). Nor are they dirty in the particular modes of dirtiness which he cherishes as his inalienable prerogative. (A cesspool is unknown out of a city.) In kindness and hospitality, according to their means, they are fully our equals; in universal courtesy and constant good humor, under all circumstances, they are greatly our superiors. I have yet to see a Honduran angry, or to hear him grumble at the heat, the wet or hardship of any kind, even hunger. I never heard one curse the mule he was driving, the tools or material he was handling, his companions nor any thing or person with which or whom he had to do. Boatmen in the bays and rivers are, as elsewhere, full of rivalry, chaff, fun and badinage, but not, as elsewhere, violent nor abusive. I never heard of a woman being struck, except one case of a drunken man who cut his mother's arm after stalling his brother. (He was the *alcalde* of the village. Who ever heard of an American Justice of the Peace committing an outrage?) I never saw a child beaten in Honduras, and I must also record that I never saw one caressed much either.

It must be understood that I speak of the lower and middle classes, my business not having brought me into contact with the high society of the capital, a loss which, from what I have heard, I need not greatly deplore. In politics the country is, like other Spanish-

American countries, a republic in name, a petty oligarchy in fact. I have thus far said nothing about

## The Mines.

I saw but few of them, and what I did see did not impress me very favorably; however, my journey being for a specific purpose, embraced but a small portion of the country, a fact which must be borne in mind in estimating the value of these notes. There is one paying mine in Honduras, the Rosario, near Tsgucigalpa the capital, which is yielding about \$60,000 worth of silver monthly, but pays no dividends. A number of mills and smelters are being erected at other points. Several prospectors with whom I conversed expressed unfavorable opinions as to the mining prospects of the country. To those who may propose going to Honduras, with the expectation of traveling about the country, I will say that they will consult their comfort by making their visit during the dry season, that is, between November and May, and by providing themselves with blankets, folding cots or hammocks, table-knives, forks and spoons, tin cups, toilet articles suitable to their habits, rubber clothing, or better mackintoshes on account of hot weather, which is injurious to ordinary rubbers; condiments, if they want such, as pickles and sauces, a stock of flea powder, good saddles, etc., suitable for small mules and provided with two cinchas or else with cruppers; it is also a good plan to carry a portable cooking outfit in the dry season, as it may be desirable to camp out sometimes, which is not feasible in the rainy season; also plenty of patience and a disposition to accommodate themselves to the customs of the country instead of going through it kicking and growling, as most of us do, because things are not as we are accustomed to find them in our own country.

Arms appear to be superfluous, but I will remark, for the benefit of those who may wish to carry revolvers, and few would care to go without them, that cartridges of .38 and .44 caliber can be got in any town, while those of .45 cannot often be obtained.

Compared with the profusion of this vegetation (in the wet season),

## Animal Life is Scarce.

With the exception of fleas, which abound, and rehound, and grasshoppers which go in swarms and destroy the milpas, as the plantations of corn, etc., are called. It is a coincidence that these two pests of the country both "have legs above their feet to leap without upon the earth," yet, notwithstanding scriptural authorization, neither is considered fit for food, though the one destroys the people's food and the other attacks the people themselves. Of game, we saw only two deer and a few doves, and of venomous creatures, except fleas, one scorpion and one snake. Birds were not plentiful, though I saw one flock of macaws, whose gorgeous plumage contrasted finely with the tropical foliage. In the dry season, it is said that parrots abound, and it seems likely that reptiles and venomous insects may be more frequently met with, yet the annual burning of the brush and grass by the people must tend greatly to the destruction of vermin. Monkeys and tigers are reported in the high mountains, and alligators in the rivers, though we saw none. The scarcity of fruit in this tropical region was a surprise to me, and vegetables are not plentiful on the dinner-tables, rice seeming to take the place of potatoes, etc.

## As to Money.

American gold commands a premium of 30 per cent in the silver currency of the country, consisting mostly of Peruvian sole and fractions, which consequently suffers a relative discount of a very small fraction over 23 per cent as to gold. The difference between premium and discount is sometimes lost sight of by the uncommercial traveler, the figure given is near enough for all small transactions. X.

## Tracing Ancient River Channels.

EDITORS PRESS:—Will you be clever enough to publish the following explanation for me? I wish to be fairly understood in this matter by the public.

I have discovered how to trace up ancient river channels and determine the class and locality of their regular deposits either under or on top of the ground. This is purely a scientific discovery not to be done by any one off-hand, but it will take a man with the heat of scientific judgment to do it successfully, and he will have to carefully study his work. Then he can go at once to every point where the deposit would be, if any was made; but if no gravel is left, that place is prospected and he has nothing to do but to go where the next deposit would be formed. It cannot always be told to a certainty beforehand whether a deposit has been left or not. But experience may render a man's judgment almost a certainty. But there will always be men who will excel in this as well as any other business.

Now this is one of the most important discoveries ever made in gold mining, and it has baffled the skill and capital of the world to find it out, but is easy enough to a man when once understood. It will make gravel mining as well understood as any other industry, and render investments just as safe and as certain of success as farming is in California to-day. I claim that it will enable a miner to under-

stand the probable value of his property just as well without the actual facts and enable him to understand what is and what is not mineral land, so far as gravel goes. But, understand, it is not to be always told whether there is gold in the surface dirt or not where there is no channel, and it has nothing whatever to do with quartz. It is simply to understand physical geology, which your purely scientific man does not.

## The Mexican Iron Mountain.

[Translated for the Press from *El Minero Mexicano* by M. N. M.]

The Mexican Iron Mountain Manufacturing Company of Des Moines, Iowa, was organized with the object of securing the property of the Iron Mountain Company of New York. The property is situated near the city of Durango, Mexico, and was acquired by this company July 6, 1886. It comprises the Rancho de Murga, which contains about 43,000 acres of productive and timber land. It extends from the limits of the city of Durango toward the west nearly 30 miles and possesses very valuable water rights and privileges. It has also foundries, machine-shops, blasting furnaces and hoisting machines almost complete and ready for operation. The property of no value acquired by this company is a mountain of mineral iron called the Cerro del Mercado, situated two miles north of the city of Durango, which has 30,000 inhabitants. The Cerro del Mercado is one mile long, one-third of a mile wide and 400 to 600 feet high. The surface of the mountain, the mineral of which is of excellent quality, is 10,000,000 feet square, but there are indications that the deposit is not all *flor de tierra*, but it increases as the soil is removed. The magnitude and wealth of this deposit has attracted the attention of men of science during the last hundred years. The Encyclopedia Britannica mentions the Cerro del Mercado as one of the four most famous deposits of magnetic iron on the globe. Humboldt,

## In His Great Work on Mexico,

Treats especially of this mountain and suggests as a possibility of its origin that it was an immense aerolite which had fallen there. Ward's History of Mexico, edition of 1829, says that the Cerro del Mercado is composed of two distinct qualities of metal (crystallized and magnetic), both equally rich, since both contain from 60 to 70 per cent pure iron. Vol. 2, p. 522. "I believe that in no part of the world a situation can be found which combines all the advantages of this to facilitate exploitation," and adds, p. 292: "In the vicinity of the capital (Durango) materials of construction abound. Lime and stone can be obtained almost at the doors of the city." The following is an extract from the report of John Birkinbine, secretary of the American Charcoal Iron-Workers' Association: "Considerable time was employed in examining the mountain, ascending its elevated declivities and collecting specimens on its surface. I am not disposed to confirm the opinion of some authorities declaring the deposit to be a solid mass of iron, although nearly all the surface presents the mineral to sight. I am inclined to believe that the Cerro del Mercado is formed of one or more

## Immense Veins of Mineral

Of specular iron arranged almost perpendicularly, and whose fragments by the action of the elements in the course of ages, have been hurled down, forming the declivities of the mountain; but the extent of this mineral detritus is too great to permit the localization of any foot or perpendicular wall. However, the study of the formation of this great interest has no importance for your present consideration, because the quantity of mineral which is in sight is practically inexhaustible, and the question whether the mountain is a solid mass of mineral or whether the overtopping little towers which rise from the declivities are parts of the great veins, will not affect its value as a source of production for generations to come. I have then only to verify the computations formed by others upon the number of hundreds of millions of tons of mineral which these deposits contain." Hon. Joseph Nimmo, statistician, in his report to Congress entitled "Commerce between Mexico and the United States," says, p. 18: "The mountain of iron del Mercado in the State of Durango can supply all the furnaces and foundries of Great Britain at the present rate of consumption for more than three centuries. This vast deposit of mineral iron would represent many millions of dollars if it were in the United States. It is worth more where it is. Mexico imports the iron which it consumes. There is not a pound of steel manufactured in the Republic, and very little iron. Nails sell by wholesale at \$16 to \$20 per barrel, and the common hars of commerce at \$210 per ton in the City of Mexico, which is the greatest and cheapest market of the country. In the shadow of that immense mountain of iron, the bar of that metal manufactured in England is \$230 per ton. The same class of iron can be bought to-day in Chicago for \$38. The enormous duty and cost of freight represent the difference in value. That difference will leave a great margin in favor of this company on all the products manufactured." Many enterprising citizens of Iowa are interested in this famous property.

## Mexican Mines.

## The San Miguel Mine.

EDITORS PRESS:—In a former letter I acquainted your readers with a short history of a mining enterprise, and with some of the results which followed the intelligent application of English capital and English stamina by the working of Las Minas Prietas in this State of Sonora. To-day the history of another large mining enterprise, requiring the expenditure of a large sum of money for machinery only, by similar British enterprise and pluck, may interest some of your readers.

The Sonora Silver Mining Company (limited) of London owns the San Miguel silver mine, situated, lying and being near Soyopa, in the center of a rich mineral district, containing, among numerous others, the Nochs Buena, la Barranea, los Bronces mines. The San Miguel mine was discovered in 1870 by Don Joss Arviso, who took out very rich chloride ore from the surface. He, with three partners, worked about one year without any system at all, or only that which the German miner tersely calls *raub bau*—robbing the mine—which yielded from 50,000 to 60,000 ounces silver per month, with a force of about 50 men in mine and hacienda, containing the arastras. The mine having been sold to new owners, was worked thus in the old way for two years more, enriching whomsoever came in contact with it. Meanwhile the ore changed its character from chlorides to sulphurets, antimonial and arsenical silver ore, and the owners knowing nothing of the economical treatment of this kind of ore, and greedy for more wealth, and entirely regardless of the security of their workmen and of the mine, began to take away its pillars of rich chloride ore which had to be left standing.

For a short time things went on smoothly, as the short-sighted and ignorant owners fancied, till their foolish policy bore its legitimate fruit—all natural supports having thus been taken out of the mine without replacing them with artificial ones, a general cave occurred on Good Friday, 1875, which put a stop to all further work; it being a feast day, happily no miners were at work, otherwise all would have been killed.

In the meantime a lot of the sulphurets ore having been sent to a mill owned by Don Miguel Lopez and treated successfully by a German metallurgist, proved to the mill-owner the value of the mine, and he purchased it, associating with himself two experienced German miners and metallurgists.

A new tunnel about 600 feet long and considerably below the old works was run, and having struck the vein of the rich sulphurets ore, ranging from six to ten feet wide, occasionally widening even to 30 feet, and averaging 150 ounces silver per ton, the development of the mine and subsequent extraction of these rich ores began, and with it an era of extravagance such as miners and gamblers only are capable of. Fast living was the order of the day, champagne flowed like water; new sources of expenditure were sought for and hailed with delight. An expensive road over the mountains was constructed, a costly mill for pan amalgamation was built and afterward changed for the lixiviation process; large and fine buildings for offices and residences erected; a new tunnel driven 500 feet through hard rock and then abandoned before completion owing to bad air; in short, many untimely, useless, reckless and profligate expenditures indulged in, which naturally brought in their train bad management, dissensions and finally costly law-suits between the owners, all of which resulted in Lopez's sole ownership of the whole concern.

Don Miguel Lopez then worked the mine alone, extracting and beneficiating large quantities of medium and high-grade ores, but neglecting this branch of his business for his land and cattle interests. Leaving incompetent and dishonest men in its charge, he ran the mine into debt, and this, in conjunction with Apache troubles and a mill sadly in need of repairs, forced him to dispose of his interest to the house of Ortiz in Hermosillo. It is estimated from what is shown by the books of this house and by the records of the mint in Hermosillo, that over eight millions of dollars were produced by this one San Miguel mine.

This valuable property passed about one year ago into the hands of the Sonora Silver Mining Company, which is now contemplating the erection of machinery capable of concentrating and reducing 150 tons of ore daily, using water-power by a ditch from the Yaqui river. Experiments made by O. Pletz, M. E., to whom I am indebted for all this information, show that 10 tons of ore may be concentrated into one ton of the value of 200 to 400 ounces silver per ton, varying of course according to the

nature of the ore and the levels from which it is extracted.

In my next I propose to give you some information about a similarly situated mine in the Magdalena district, only 25 miles from the Sonora railroad, which mine or mines contained the same chloride ores as found in the San Miguel mine, which subsequently were followed by so-called rebellious silver ores, which facts induced or rather compelled its ignorant former owners to dispose of it, and which necessitates only the economical and intelligent expenditure of about \$10,000 to \$15,000 to place it on the Bonanza list; that is,

and machine shops will furnish, as they do already now, the supplies aside of the *nerus rerum* of all mining enterprises.

THEO. G. ED. WOLLEB.  
Hermosillo, January, 1888.

**WIRE BELTING.**—The first pisos of belting made with wire has been manufactured at Beaver Falls, Pa., by J. E. Emerson and Thos. Midgely, under patents taken out by the latter. The piece is 40 feet long and 4 inches wide, and is made from No. 20 steel wire. It is said to be as pliable as leather; in fact, more so, and will wrap around a one or two-inch shaft with

FIG. 1.—VIEW OF AN ANCIENT CORK-OAK IN PORTUGAL.

FIG. 2.—VIEW OF A GIANT CHESTNUT IN PORTUGAL.

to open it sufficiently to extract ore. The building of reduction works is another question yet not to be dismissed until the mine is yielding freely its hidden treasures. It is useless to expect that the formerly so enterprising San Francisco mining men (if there are any left) will take hold of a mine across the line, in fact it would be difficult to find a mining clique more afraid of Mexico than the Californians are; and thus the property will attract Eastern or European capital, and naturally too the flow of the silver bullion will turn eastward over the Rockies instead of in its natural western course. Eastern men naturally patronize their own markets for machinery and mining necessities, and therefore Chicago and St. Louis foundries

outstraining the wire. The link arrangement is similar to that of the flat gold chains worn by gentlemen and ladies, and presents a handsome appearance.

**A NEW FUSIBLE PLUG FOR STEAM BOILERS.**—The fusible metal is supplied in the form of a ring, into which is driven a plug of gun-metal. The fusible metal is thus between two good conductors, and is, therefore, admirably placed for prompt action; at the same time it is so far removed from the furnace, and protected by the cup in which it is set, that it can only be fused by the boiler-plates getting hot—a consideration of importance. The plug, we understand, has already come into extended use.

## Two Giant Trees in Portugal.

As we are growing both cork oaks and Spanish chestnuts in this State, it may be interesting to look forward and see what coming centuries may behold in California. The engravings on this page and the following description by M. Charles Joly of two giant trees in Portugal, will give suggestions for such a forecast. M. Joly kindly sends us a little pamphlet containing an extract from the *Journal de la Société Nationale d'Horticulture de France*. A translation for the PRESS is prepared by our obliging polyglot M. N. M.

Among the curiosities deserving the attention of the hot-airists and travelers are the colossal trees found in certain regions where people have respected the work of nature. Of these giants I will mention a cork oak (Fig. 1) and a chestnut (Fig. 2), the photographs of which were sent to me by my friend M. Duarts de Oliveira of Oporto.

It is a well-known fact that the coast of the Mediterranean is specially favorable to the growth of the cork oak (*Quercus Suber* L.). It requires a climate, which, if not hot, must be, at least, but little exposed to sudden changes of temperature and to rigorous cold.

When the tree is virginal, that is to say, has not yet been stripped of its bark, it can easily resist the inclement seasons; but when it has been denuded, the cold air and the excessive heat are equally prejudicial. In former times cork was used only for stoppers, but now it is used by builders, hat-makers and for machinery. From it are made caskets de visite, and of etiquette, carpets, life-

preservers, hnoys, etc., and the residue is ground by machinery for packing purposes. Algeria, like Tunis and Morocco, possesses wonderful forests of cork-oaks. They are likewise found in Catalonia and Andalusia.

France has forests of them in Provence, Gascony, the Landes and in Corsica. In Portugal there are very extensive forests in the provinces of Estremadura, Alemtejo and Algarva. The latter country exports to England a considerable quantity of cork, which is returned to Portugal in the form of stoppers for the famous wine of Oporto so esteemed by our neighbors. Cork is to day a very important object of commerce in Portugal, and day by day its value increases. In 1867 it was 0.15 fr. the kilogr.; now it is 0.25 fr. In the provinces of Alemtejo and Algarva the acorns are gathered to be fed to the hogs, the superiority of which animal is attributed to this alimentation.

It is in Portugal that the colossal oak, the subject of this notice, is seen. It is on the property of M. le Vicomte de Rohoredo, and is called in that country *Herdade de Torre*. It is 500 meters north of the chapel of St. Goncalo, upon the Palmella road, and 15 kilometers south of Lisbon. It measures nine meters (nearly 30 feet) in circumference at one meter from the ground; is 18 meters (nearly 60 feet) high, and its diameter at the top is 20 meters (about 66 feet).

The tree is regarded by the people of the vicinity with a kind of veneration, and they respect it as the Druids did their forests. It has still a great part of its first bark, which, at certain points, exceeds 20 centimeters (about seven inches) in thickness. The exterior of the trunk does not present any cavity. Sometimes the yearly yield is abundant and a product of 800 liters (about 22 bushels) of acorns is not unusual. M. Carlos Pimental, a learned Portuguese silviculturist, thinks that this oak is the dean of the forest, and that it must be at least 400 years old. There are in the vicinity other oaks of from four to six meters in circumference.

The second colossal tree (Fig. 2) is the chestnut of Alconogosta, which is upon the northern declivity of the Gardunha mountain, near Fundao, at an altitude of 800 meters (about 2600 feet). At that place are found trunks of considerable diameter. Unfortunately, however, their branches have been cut off for use in building. The most colossal tree among them is on the road from Fundao to Alconogosta. Since it was lopped about 20 enormous branches have grown out. The trunk is six meters (about 20 feet) in height and 14 meters (about 46 feet) in circumference at one meter from the ground. An opening on the north side, three meters in width, gives access to the interior of the trunk. When it had all its branches its diameter was 20 meters, and its shade covered a surface of 150 square meters, or about 1600 square feet of area.

**CUTTING AND WORKING PRECIOUS STONES.**—The increased use of precious stones has brought out patented methods for finishing them to the best advantage and more quickly than by old processes.

## Passing Events.

Several matters of interest to miners are now before Congress, among them the Stewart Mining bill, to which we refer elsewhere. It seems also that the Hearst amendment to the Alien Act, allowing aliens to hold mines, is to be modified to exclude the Chinese.

The reduction of miners' wages at several of the leading mines in the Wood river region, Idaho, has been contemplated for some time, but has only now been put into effect. It is hardly probable, under the circumstances, that any first-class miners will remain there or go there; and if they get second-class men they will get second-class work.

It is worthy of note that the Anaconda Co., Montana, will soon discard their ordinary stamps and use a steam stamp. The Homestake Mining Co., Black Hills, Dakota, are about to do the same thing.

The high price of coal has stimulated prospecting for coal veins all over the coast. Some new mines have been opened and a number of old ones are to be worked again, now that prices warrant it.

There is great opposition to the Polish miners at Reading, Pa.

GYPSUM FIELDS in Kern county are attracting attention.

## A Fit Basis for a National System of Finance and Currency.

Some time since our Government sent an agent to Europe to ascertain and report what chance, if any, there might be for inducing the leading European Governments to join ours in an effort to fix the relative values of gold and silver, and to take measures looking to the adoption by them of a bi-metallic currency. After due inquiry, this agent reports that, while there exists among certain parties in the countries by him visited a strong sentiment favorable to both the above objects, they are stoutly opposed by the ruling classes in England as well as on the continent. The opinion is expressed that, while the doctrine of bi-metalism is there gaining ground and will ultimately prevail, it will probably be a long time before it takes practical effect. Such being the case, it looks as if the United States Government might venture to cut loose from these Old-World peoples with their narrow and benighted methods and adopt such financial system as our peculiar circumstances seem to require.

We noticed not long since the bill introduced by William M. Stewart in the United States Senate, substituting certificates of deposit for gold and silver coinage, commenting favorably on the provisions of the same. That bill, which embodies our idea of a fiscal policy worthy of acceptance by the American people, is, we are glad to see, gaining favor with the masses everywhere and with all classes of the community in the silver-producing regions of the West, where, if adopted, it would tend to greatly promote that industry. The workings of that bill would not only be equivalent to the free coinage of silver, but it would relieve the producer of that metal from being obliged to pay, as at present, the expense of its coinage, while increasing its value over present rates fully ten per cent. In superseding the circulation of coin, as it would do to a large extent, there would be saved the loss caused by the wear of the precious metals through their constant use. When one of these certificates became badly worn or otherwise rendered unfit for circulation, a new one could without much expense or trouble be issued to the holder. Then, for purposes of remittance, this would be a safe, cheap and convenient medium, as these certificates to any amount could be sent through express or mail, the holder, when he desired to do so, being able to readily convert them into coin. These certificates would, in fact, possess every element of a perfect currency. We should have bi-metalism unrestricted and in its best form. The value of gold and silver, absolute and relative, would be fixed, certain and permanent. Whether they existed in bars, ingots or coin, this would be the case. When deposited for the issue of certificates they would require to contain 90 per cent pure metal. Every gold dollar represented by these certificates of deposit would contain twenty-five and eight-tenths grains of that metal, and every silver dollar four hundred and twelve and one-half grains of that metal, each of the above fineness.

Under this system, there being no fluctuation in or uncertainty about the value of the precious metals, there could be no speculation in them. Silver ceasing to be a mere commodity, as at present, would no longer be bought and sold on an ever-varying market. It would become a veritable money, and as such be just as much a measure and standard of values as gold. Under this new order of things London would no longer be the silver mart of the world, nor would the price of that metal depend on the daily caprices of her bankers and money-changers.

We produce more than four times as much of the precious metals as any other country in the world; nearly twice as much as all other countries combined, and ought not to be taking lessons of these non-producers or shaping our monetary policy with reference to their interests and desires, much less to the whims and vagaries of their theorists. We should adopt a system suited to our own conditions and wants, and, going our own way, leave the rest of the world to go theirs. If mono-metalism suits them let them adhere to it. If they choose to ostracize silver it is their privilege to do so. As for these United States, with their phenomenal growth of population, wealth and industries, they can no doubt stand it. There can occur here no

glut of the precious metals. Even when our present product of gold and silver shall have doubled, as it probably will do in the next 20 years, we shall have room and use for it all.

We may properly leave to England, Germany, and their allies, the business of buying and selling silver and of decrying its use as a money. This for the moment seems to suit their interests, and that is all they care for. Timid and short-sighted, they act prematurely and precipitately, being unable in the presence of great events to grasp their significance and probable outcome. When gold was discovered in California, fearing a glut, they denounced that metal. When the Comstock find was announced to the world, overrating its importance, they reinstated gold and declared against the use of silver, forgetting that the population and business of the world are increasing at a much more rapid rate than the product of the precious metals, which, were both to be accepted and used without discrimination, they would still be insufficient to meet the growing demand for a monetary medium. It is in these old countries a difficult thing to turn the car of progress from its track or even make the attempt, they who run it fearing such effort might dangerously strain the machine. Hence it is suffered to lumber along in the old rut till there occurs a final smash-up to the dismay of all concerned.

## Relocating Claims.

In another column are given the provisions of Senator Stewart's new mining bill. Among them is one which provides that no person shall relocate a claim which he has previously located.

At first thought it would seem that such a provision would work a hardship to miners, and in a few cases it might; but when the matter is properly considered it will be seen that the idea is a good one. In effect it simply carries out more forcibly and in express terms the idea that the original laws of May 10, 1872, intended.

At that time we copied an idea from the Mexican mining laws, which was to compel men to do work on their claims or give them up to some one who would. The United States for the first time required a specified annual expenditure on claims, not leaving it to the different districts to regulate this. But unfortunately it was provided that the mine could be relocated provided that the original locators or legal representatives had not resumed work after failure and before a relocation. The practical result of this has been that a good many men did not work at all, but simply were on hand on the 1st of January and relocated the claim themselves. In this way they evaded the law, and still continue to evade it.

The mining laws of the United States are most liberal. Any one who finds a claim on public land can take it up as his own property. He has not got to pay a cent for it unless he gets it patented. He can work it for 20 years or more without patenting it if he wants to; or he can work it all out and never pay anything at all. He is not compelled to patent it unless he wants to. Surely nothing could be more liberal.

Yet the laws are evaded persistently, and especially in this matter of annual expenditure. It would seem that after a man has held a claim for a year he would know whether it was worth anything or not. At any rate, if he has tried to find out he has expended in labor or money enough to hold it under the law.

And that is just the point. The law is designed to protect the miner who in good faith tests his claim by working it; and is designed to force the man who does nothing to give up to some one who will work. Senator Stewart's bill effects both these points better than the present laws. If a man does nothing for a year on a claim he has located, let him give it up to some one who will. It will be much better for the mining interests, and will prevent one man holding a dozen or so claims without working any. The best thing for the mining interests of the country is for the claims to be worked. If the locations are no good, abandon them; but to leave this undetermined for years in succession does no good to any one.

THE rates on ore from Hailey, Idaho, are \$17 to Denver, \$20 to Omaha, \$21 to Kansas City and \$13 to Salt Lake.

## California Iron and Steel.

There is only one iron mine in California which has ever put any pig iron on the market, and that is the Clipper Gap mine, in Placer county, California. A disastrous fire occurred at the works over a year ago, since which time nothing has been done. The California Iron and Steel Co., which owns the property, held a meeting this week.

The report of the Board of Directors for the past year showed the corporation to be in a more satisfactory condition than was the case at the last annual meeting. The report specifically mentioned some of the resources of the company, among them being 7960 acres of land in Placer county, for which an offer of \$25 an acre had been obtained. There were the mine, machinery and other improvements, worth about \$30,000, and the mills at Emery Station, valued at \$70,000. As against these resources, there were outstanding bonds to the amount of \$39,000, with accrued interest of nearly \$15,000. As to these bonds, the bondholders had offered to accept \$67,000, which would be a very material reduction in case the affairs of the company could be brought to that state where cancellation of the indebtedness could be accomplished. The report figured the available resources at \$290,000, and the total liabilities at \$140,500. This would leave a net balance of \$149,500, or about \$7.50 a share. The attorneys for the stockholders, who had instituted suits against the directors, who, it is said, declared and paid six dividends by creating an overdraft of \$39,500 at the First National Gold bank, had given assurances that the stockholders would recover the full amount sued for. If this amount is added to the \$149,500, the net resources would be increased to \$189,000, or about \$10 a share.

Some stockholders thought the estimated value of the Emery Station property too high, but competent appraisers had placed it at \$70,000 to \$75,000. The treasurer's report showed receipts for the year to be \$6525.05, and disbursements amounting to \$6496.73. Efforts are being made to harmonize the differences between the stockholders and bondholders, but until this is done nothing else can be accomplished. The following Board of Directors was elected to serve for the ensuing year: George D. Dornin, George W. Gibbs, W. Murray, Charles Pace and Andrew Baird. George D. Dornin was chosen president; George W. Gibbs, vice-president; First National bank, treasurer; and F. Bonacina, secretary.

LICK OBSERVATORY ASTRONOMERS.—Mr. E. Barnard, noted for his astronomical discoveries, and one of the recently appointed astronomers of the Lick Observatory, has just been elected a member of the Royal Astronomical Society of London. This honorable distinction came unsought. S. W. Burnham is also a member of this distinguished society, and Prof. E. S. Holden has been for some years one of its 50 foreign associates. Chas. B. Hill of this city was this week appointed by the Regents as assistant astronomer of the Lick Observatory. This talented young gentleman has long been an assistant of Prof. Davidson's at the Davidson Observatory, San Francisco, and is one of the two astronomers of the Chahot Observatory of Oakland. This appointment of a young Californian is an eminently proper one. Mr. Hill is an enthusiastic astronomer, has plenty of ability and ambition, is a good mathematician, and ought to be able to fill satisfactorily the position for which he has been selected.

MINERS' WAGES IN IDAHO.—The Minnie Moore, Queen of the Hills and Relief mines at Broadford, Idaho, have notified the miners in their employ that hereafter their wages will be at the rate of \$3 per day. This move on the part of these large mining enterprises will no doubt cause others to follow suit. It is stated that the miners, all of whom belong to the Knights of Labor, will quit work. Quite a number have left through the winter owing to the reduction of the working force on the mines in the Wood river region, which they took to be a sign of a reduction in wages. Some 40 or 50 went to Aspen, Colorado. A few went to Butte and Virginia City, and a very few to Utah. If the rest have to leave, the most of them will go to Colorado. The former rate of wages was \$3.50 per day, and the cut is therefore one of 50 cents per day.

## Hints to Prospectors.

## Plants Which Indicate the Presence of Mineral.

In ancient days more or less attention was paid to the presence of particular grasses or shrubs and the general appearance of the flora in searching for minerals.

Agricola, (*De Re Metallica*) after describing the manner in which veins outcrop, or can be traced by "float" from their outcrops, offers the following remarks concerning the relations between vegetation and underlying veins:

"Then we study veins by observing the hoar-frost, by which all plants are whitened except those which grow upon veins, because these emit a warm and dry exhalation, hindering the congelation of moisture; wherefore such plants rather become wet with water than white with frost—as may be observed in all cold places, before the plants have come to their full size, as in April and May, or when the late hay, which is called *cordum*, has been cut with the sickle, as in September. Wherever these humid plants do not congeal with hoar-frost, there is a vein beneath. If this exhales very warmly, that ground bears low plants, not of lively color. Lastly, trees, the leaves of which in spring are bluish or livid, the upper branches in particular being affected with blackness, or some other unnatural color, the stems cleft, and, like the branches, black or discolored; for these are the effects of very warm and dry vapors, which do not spare even the roots of the trees, but, burning them, render them weak. For which reason the force of the winds more frequently destroys trees of this kind than others; but it is veins that emit the vapor. Wherever therefore many trees, situated in a given long line, lose their vigor and blacken or become discolored at the most unseasonable time, and are frequently overthrown by the force of winds, there is a vein beneath. But when likewise along an extended course, where a vein stretches, a certain plant or a certain kind of fungus grows, which is absent from intervening lines, or even from neighboring veins [this also is a sign]. And in these ways veins may naturally be discovered."

Mr. R. W. Raymond, the accomplished secretary of the American Institute of Mining Engineers, in a paper before that society, states that there is a significance in this brief allusion to particular plants or fungi as growing over particular veins. It shows that this phenomenon has been observed. In his paper on "Indicative Plants," from which we quote, Mr. Raymond says: "The general relation between the flora and the geological formation of any given district is a fact familiar to field geologists. It is often possible after the necessary local practice to follow the lines of different rocks by this sign alone through areas where there are no exposures. Here, doubtless, we have to do with causes which chemical analysis of the soil will reveal, aside from those which depend upon moisture and temperature only. And we are prepared to believe it possible that not only the proportions of silica, lime, alkalies, etc., in the soil, but also the presence of metallic combinations may exert an influence upon vegetation.

"A striking instance—the only one so far as I know, which has been scientifically investigated heretofore, is that of the zinc-violet (*Galmeiveilchen*) or *Viola calaminaria* of Westphalia, peculiar to the zinc deposits of that region. I translate from its reprint in *Poggendorff's Annalen* (xvii., 175), a paper on this subject by A. Braun, which appeared in the monthly report of the Berlin academy for January, 1854:

"It is known that the calamine-bearing hills of Rhenish Prussia and neighboring parts of Belgium possess a peculiar flora. The traveler in that region is particularly surprised by a violet, related to *Viola tricolor*, which unfolds its numerous beautiful yellow blossoms in uninterrupted succession from spring to late autumn, and is generally known in the neighborhood of Aix (near Stolberg, Hergenrath, Vieille Montagne, etc.), by the name *Galmeiveilchen*, or in the local *patois*, *Kelmeveilchen* or *Kelmesblume* (calamine-violet, calamine-flower).

"The mining officials of Vieille Montagne assure me that the zinc-violet cannot be cultivated in gardens without reverting to the characteristics of the ordinary *tricolor*. This prob-

ably refers to a change in the color of the blossoms only—a point concerning which experiments already begun in the Berlin Botanical Garden may give further light.

"The occurrence of *V. calaminaria* in a relation so constant to the zinc contents of the soil that successful mining explorations are undertaken on this sign alone, led me, during my visit to Aix last year, to request Mr. Victor Monheim of that place, who is eminent as a mineralogist and chemist, to make a chemical examination of this plant, with special reference to possible traces of zinc. Mr. Monheim courteously acceded to my wish, and sent me in November the following report... from which it must certainly be concluded that to the 18 elements hitherto known as entering into the structure of plants, zinc must now be added.

## Observations on Mount Hamilton.

We had an opportunity this week of conversing with Mr. Alvan G. Clark of Cambridge, Mass., one of the makers of the big lens of the Lick telescope. Mr. Clark is the youngest son of the famous Alvan Clark, who died just after the completion of the Lick lens. He has been for some weeks at the Lick Observatory on Mount Hamilton, attending to certain details connected with the telescope.

Mr. Clark was wonderfully pleased with the clearness of the atmosphere at Mount Hamilton, and the facility which it offers for astronomical research. While there he had the great pleasure of discovering a new star—the seventh star in the trapezium of Orion. This star has never been seen before. He says the

A PLANT INDICATING THE PRESENCE OF ZINC.

"Abstract of Monheim's Report on Analysis of *V. lutea calaminaria*.—Plants collected in October, in parts still in flower; freed from adhering earthy particles by washing; treated with water acidified with hydrochloric acid for 16 to 18 hours, until no more inorganic matter was taken up. The finely-divided plant was then treated with HCl for 12 hours in a water-bath, and in the decoction thus prepared zinc was detected by the usual method. Zinc was also detected in the sap of the plant."

I am informed that the late M. Tessie du Motay recognized this zinc plant at the Horn Silver mine in Utah, the ore of which contains a considerable amount of a curious flesh colored zinc-blende.

The engraving is a life-size sketch of *V. calaminaria*, made from a specimen in the herbarium of Columbia college.

A SHORT TIME ago a peasant plowing at Tjoring, in Denmark, unearthed a handsome armlet of pure gold weighing 12 ounces, which, according to the director of the Museum of Antiquities in Copenhagen, dates from the second or third century, A. D.

discovery is very important for two reasons: "It shows the power of the telescope at the Lick Observatory, proving it to be the strongest in the country—the strongest in the world; and it also shows the advantage the observatory has over nearly all others in the United States in the matter of locality. I think in that respect the people of the Pacific Slope are to be congratulated. I have looked through the telescope from my home in Cambridge for new stars in the trapezium of Orion, and have been unsuccessful in the search. On Mount Hamilton, however, the discovery is made almost the first night we try the instrument. This star is within the trapezium, and it is, I think, the only one that has ever been discovered there. There have been seen six stars about Orion, and this makes the seventh."

Mr. Clark has visited most of the noted observatories, and is naturally very well posted on the subject. The Lick Observatory has advantages possessed by no other—the clearest atmosphere and the largest telescope. The "glorious climate" was not up to its usual mark during his visit, and although he is from

cold Massachusetts, he suffered from the cold more on Mt. Hamilton than ever before. The severe wind and the insufficiency of heating apparatus combined toward this result. Some changes will be made in the arrangement of the plumbing at the observatory, and some also in other departments, after the experience of this exceptionally cold winter. Considerable work yet remains to be done before the observatory will be turned over to the University Regents.

Mr. Clark is confident that, with the very efficient corps of observers and the complete outfit of instruments, the Lick Observatory will bring fame to California. The corps will compare favorably with any in this country or Europe. Mr. Clark had a good observation of Saturn and was delighted with the detail he was enabled to study. The tests with double stars were also highly satisfactory. While the weather was unpropitious during his visit, he was nevertheless enabled to make such observations as convinced him that at no other observatory was there such an opportunity of making important discoveries and observations as at the Lick on Mount Hamilton, Santa Clara county, California.

## The Scarcity of Coal.

Coal of all kinds continues very scarce in this market, and prices are ruling very high. While this is a great inconvenience to domestic users, it is still more so to manufacturers. One large flouring-mill in San Francisco has had to close down and discharge its men, and it is thought some other large establishments will have to do this also.

There has been an enormous increase in consumption of coal in this State, with which coast production has not kept pace. The disaster at the Wellington mine and the shutting down of the mines there as well as at Nanaimo has shortened our coal product about 1000 tons a day. The miners at Nanaimo and Wellington have been holding meetings at both places during the past week for the purpose of discussing a better protection to miners and to decide on a different basis of working. The result of the inquest proved that the disaster was caused by badly placed shot, and in future all drill-holes will be examined by a competent man before being charged, to determine whether the shot will do the work calculated upon. The owners of the collieries have agreed to discharge all Chinese help, so the miners have gone to work again.

Rails enough have arrived at Seattle to finish the Seattle, Lake Shore & Eastern railroad to the Squak coal mines. The Squak mines are owned by the Seattle Coal and Iron Company. They are new ones, with veins 10 feet thick, and of good quality of bituminous as can be found anywhere. New bunkers have been built at Smith's Cove similar to those on the Jarvey Central road in New York harbor. The mines can ship 1000 tons a day.

A number of vessels are on the way to this port with cargoes of foreign coal, but it will be some time before supplies will be able to replenish stocks. All the coast collieries are exerting themselves to produce as much as possible.

THE ROTARY SNOW-PLOW.—The new form of rotary or "propeller" snow-plow now coming into use on the railroads of the West is of Cook's patent, and is very effective. Several years ago, Oliver Hyde of Benicia wrote to the managers of the S. P. R. R., suggesting this form of plow—that is, one with a propeller or front to cut its way. Mr. Hyde had used rotary plows on land and had been experimenting in that direction. The managers of the road, however, did not believe in the principle. They thought the plows they were using were the best that could be made for roads where the snow falls eight or ten feet. These could only be used by having 10 or 12 engines behind each one and forcing the plow into the drifts. They thought the rotary-propeller principle would be a detriment. But they are using a rotary snow-plow now and it does first-rate work—much better than the old-fashioned ones.

E. J. PERRY has discovered new mines in the Summit Springs range, about 50 miles southeast of Winnemucca, Nev. Several locations have been made, all of which look well. One of the ledges is about 30 feet wide, with streaks of ore through it which assay from 55 to 99 ounces in silver and 66 per cent lead, and from \$4 to \$6 per ton in gold.

## MECHANICAL PROGRESS.

## The Lathe—The Oldest Machine Tool.

The oldest machine tool known is the most valuable. It contains the germs of all others, whether rotary or reciprocating, and can be made to take the place and do the work of any one of them at a time, and all of them as desired. Its origin is lost in the mist of prehistoric times. It is as old as the loom, and was used by the oldest nations. As constructed in these times, it has reached great perfection, and is made in various special forms; there are boring and chucking lathes, turning lathes, screw-cutting lathes, drilling lathes and polishing lathes. But a screw-cutting lathe with rack or friction feed, and the other ordinary appliances of a complete lathe, comprehends in its capabilities almost all the offices of the other special tools used in the machine shop.

Take a single instance of its capabilities, the production of a screw tap. The lathe will cut a piece from the steel bar; it will drill its centers and countersink them; turn the tap, whether straight or taper; cut the thread on it; score the tap, either by a cutter in the tool-post while the tap is suspended on the centers of the spindles, or by means of a rotary cutter or milling tool on the spindle centers while the tap is held on temporary centers on the tool carriage. Even the top end of the tap can be squared by similar means for the reception of the tap-wrench.

Now all this work represents the cutting-off machine, the drilling lathe, the turning lathe, the screw-cutting lathe, the planer, or the milling machine. And, unlike many combination tools, the lathe can be made to do all this work well.

With a cheap attachment the lathe can be made to cut gears, making the teeth with practical accuracy, and the lathe itself can be used to produce the index plate that insures this accuracy. A job of planing—or surfacing—where the work will swing in the lathe, can frequently be better and quicker done on the lathe chuck than on the planer platen. The rapidity is much greater because the surface to be worked is continually under the action of the tool, instead of having more than one-third of the time wasted in the running back of the platen for the return chip.

In short, all the other machine tools, either of a rotary or reciprocating character, are simply modifications of the lathe; and with the lathe and its convenient appliances and necessary tools, the mechanic can by the exercise of his taste and skill perform almost any ordinary job in the working of metals possible on machine tools. The possession of a screw-cutting lathe, rest foot lathe and a common bench vice, with their accompanying hand tools, is an excellent outfit for the amateur.

## Set Screws in Heavy Machinery.

A correspondent of the *American Machinist* offers the following suggestions in connection with the recent discussion at the meeting of the American Society of Mechanical Engineers:

One is that the thread for the set screw can often be most usefully obtained on the casting, or similar heavy part, by sinking a loose nut into it in a carefully cored pocket or recess. Thus a full thread can be obtained (rare in cast iron when tapped out of the solid) for the set screw, and if at any time it stretches, or becomes loosened in any other way, it can be wholly renewed at the trifling expense of a new nut.

A second is that for some few cases it will pay to sink a nut or threaded hushing into the casting, to be screwed in dead solid. Into this the tap hole, if that is what is meant by "set screw," can be tapped with the usual slightly loose fit in the thread.

A third is that, when it can possibly be used and tolerated, a standing bolt or stud is far preferable to any tap hole, especially when it must be cored in cast iron. In rolling-mill machinery, in which the vibrations are often extreme, and many bolts are liable to be broken, it is a well-approved practice to use standing bolts, in which the part tapped into the solid iron is  $\frac{1}{4}$  or  $\frac{1}{2}$  larger than the upper or outer end, which receives the nut. Between the two ends the body of the bolt is made square, so that if, by some heavy blow, the outer, weaker end is broken off, the root or inner end of the bolt can be hacked out of the hole, leaving the thread almost invariably in perfect condition. Neither of these devices is new, but each is thoroughly good in its place.

**HEAVIER ROLLING STOCK.**—The Altoona shops of the Pennsylvania railroad are now constructing gondola cars of 60,000 tons capacity. Fifty cars daily is the output already attained. The greatest change over the old style of cars is in the trucks. They will be lowered several inches and each be supplied with three sets of wheels. The managers of the road are confident that by means of this massive rolling stock the car famine will soon be a thing of the past. As a natural sequence to the heavy movements thus created, more powerful engines will have to be employed. The entire locomotive department of the Altoona shops is now employed in constructing engines whose weight is 136,000 pounds, and they have the largest boiler surface of any engine built in the world. Every day sees a

new one turned out of the Altoona shops. These immense machines are exceeded in weight by a few special engines on mountain roads, the heaviest being the "decapod" engines of the Northern Pacific, in use over the Stampede Pass, the total weight of which on drivers and truck is 143,000 pounds, while the entire weight of locomotive and tender in working order is no less than 228,000 pounds, or over 114 tons.

## Self-Culture for Engineers.

The season of long evenings, which, fresh from the enervating effect of the hot weather, affords ample opportunities for reading and study. Upon the use which is made of these evenings depends, in a great measure, a man's progress or retrogression in his business. If the opportunities afforded are utilized in acquiring knowledge which will be of use to him in his business, will enable him to handle his work more intelligently, to undertake new and higher branches and to assume new responsibilities, he cannot help becoming more efficient and valuable. It may not lead to an immediate rise in salary in the spring; he may not find an immediate opportunity of applying all he knows; he may even become a better man than is required in the position which he occupies, but this is all to his advantage.

One of the branches in which the engineer must be proficient is mathematics. The intelligent engineer will find a constant use for his slates and pencil, and after he has mastered the simple branches of arithmetic, integral and fractional, and obtained a proper understanding of proportions, percentages, square and cube root, we should by all means advise him to continue his investigation into algebra. There has been a great deal of contumely heaped upon the "x y z business" by those who could not solve an equation if their situation depended upon it, but it is nevertheless a fact that an easily acquired knowledge of simple algebra will open up to its possessor a wealth of engineering and mechanical literature, will assist him in organizing his thoughts in reasoning upon a problem, save him lots of useless figuring and prove a valuable mental training.—*Exchange*.

**INSTANTANEOUS GENERATION OF STEAM.**—Many devices have been put forth for the instantaneous generation of steam; but as yet no one has been proven to be practical. The accomplishment of such a work would be a most desirable and valuable result. Hence a considerable degree of interest is naturally felt in any effort in this direction. The latest announcement is one which has been patented under English laws by John Blum, LL. D. It is of exceedingly rare occurrence for a patent to be issued in England for a process as distinguished from an invention; such a thing has not happened before, it is said, since the time of James Watt. This fact adds interest to this latest invention. If it should prove practical it will revolutionize every industry in which steam plays any considerable part. It is claimed for it that it will save 53 per cent of fuel, 96 per cent in boiler space and 66 per cent in the cost of plant. Moreover, by its use a boiler explosion becomes an impossibility.

**OIL FOR STEAM MAKING.**—The *American Machinist* says that it has, during the past six years, endeavored to show that the use of crude oil for steam-making could not compete with coal economically, except in rare cases, unless prices were changed materially. It has always, so far, been an elementary question in arithmetic, about which there ought to have been no trouble. If so, how is it that Russian engineers have for years been running steamboats and locomotives by the use of nothing but crude coal oil for fuel? There is but little, if any, difference in the price of coal on the Black sea.

**A BIG PATENT.**—British patent, No. 11,990, which has recently been issued for "Golding's Improved Mechanism for the Conversion, Modification, etc., of Motion," is one of the most voluminous documents of the kind ever issued from a patent office. The provisional and regular specifications and claims of this patent consist of 139 pages, with 72 sheets of drawings!

**STEAM AND EXHAUST PIPES.**—It is recommended that all pipes, steam, exhaust and discharge, be made as straight as possible, but all of ample area. Keep the steam-end well oiled. The exhaust should have an area double the steam-pipe. The pump should be firmly secured on a rock of masonry foundation, and in all cases be easily accessible for use.

**MACHINERY MANUFACTURERS** in this country are recognized as an intelligent part of the citizenship of the country; similarly, mechanics working at the trade connected with building machinery are recognized as men of high intelligence. Put this and that together, and there is reason for the almost entire absence of serious labor troubles in this industry.

**A RAPID RUNNING LOCOMOTIVE.**—An exchange states that a locomotive belonging to the Lehigh railway, on which Prof. Kline is making experiments, attained, during a recent trial, a speed of 82½ miles per hour.

**A NEW INCORUSTATION PREVENTIVE** and boiler-cleaner compound consists of one-half pound tannin, one pound terra japonica, one gallon West Virginia oil, and 90 pounds of soda ash. It is patented.

## SCIENTIFIC PROGRESS.

## About Diamonds.

Some one has been at the trouble to estimate the weight of the diamonds which have been excavated from the African diamond fields in the last few years to the estimated value of \$200,000,000, and have made it out to be 6½ tons. Diamond cutting, until lately, was done almost exclusively in Amsterdam, but recently the English cutters have beaten the Dutch, in some notable prizes instances. It is said that here in the United States cut diamonds are taken up at the yearly rate of \$15,000,000.

## The Matrix of Diamonds.

Professor H. Carvill Lewis, from an investigation of various diamond-bearing strata, comes to the conclusion that the mother rock or matrix of this gem is serpentine in the form of a decomposed eruptive peridotite. Thus, in Borneo, rivers which drain a supreme district supply diamonds and platinum. In New South Wales, where serpentine occurs, diamonds are also found. So is platinum. In the Urals, diamonds and serpentine appear to go together. North Carolina is distinguished for its serpentine, and diamonds have been found there. South Carolina, where diamonds and platinum are found, shows outcrops of post-carboniferous eruptive serpentine. At all these localities chromic and titaniferous iron occur in the diamond-bearing sand, and these minerals are constituents of serpentine.

## Diamonds in Meteoric Stones.

In a Russian paper appears a preliminary report of the examination by Latschnef and Jeroeff, professors of mineralogy and chemistry, respectively, of a meteoric stone weighing four pounds, which fell in the district of Krasnoslobodsk, government of Penza, Russia, on Sept. 4, 1886. In the insoluble residuum, small corpuscles showing traces of polarization were observed; they are harder than corundum, and have density and other characteristics of the diamond. The corpuscles are said to amount to one per cent of the meteoric stone. Carbon in its amorphous graphitic form has been long known as a constituent of meteoric irons and stones; lately, small but well-defined crystals of graphitic carbon, having forms often presented by the diamond, were described in our columns as having been found in a meteoric iron from Western Australia. "If this supplementary discovery be confirmed," says *Nature*, "we may at last be placed on the track of the artificial production of precious stones."

## Scientific Methods.

Scientific methods bear the same relation to intellectual progress that tools, instruments, machines, mechanical contrivances of all sorts, bear to material progress. They are intellectual contrivances—indirect ways of accomplishing results far too hard for bare-handed, unaided intellectual strength. As the civilized man has little or no advantage over the savage in bare-handed strength of muscle, and the enormous superiority of the latter in accomplishing material results is due wholly to the use of mechanical contrivances or machines, even so, in the higher sphere of intellect, the scientist makes no pretension to the possession of greater unaided intellectual strength than belongs to the uncultured man, or even perhaps to the savage. The amazing intellectual results achieved by science are due wholly to the use of intellectual contrivances or scientific methods. As in the lower sphere of material progress the greatest benefactors of the race are the inventors or perfectors of new mechanical contrivances or machines, so also in the higher sphere of the intellectual progress the greatest benefactors of the race are the inventors or perfectors of new intellectual contrivances or methods of research.

To illustrate the power of methods and the necessity of their use, take the case of the method of notation, so characteristic of mathematics, and take it even in its simplest and most familiar form: Nine numeral figures, having each a value of its own, and another dependent upon its position; a few letters  $a$  and  $b$ , and  $x$  and  $y$ , connected by symbols  $+$  and  $=$ ; that is all. And yet, by the use of this simple contrivance, the dullest schoolboy accomplishes intellectual results which would defy the utmost efforts of the unaided strength of the greatest genius. And this is only the simplest tool form of this method. Think of the results accomplished by the use of the more complex machinery of the higher mathematics!

Take next the method of experiment so characteristic of physics and chemistry. The phenomena of the external world are far too complex and far too much affected by disturbing forces and modifying conditions to be understood at once by bare, unaided intellectual insight. They must first be simplified. The physicist, therefore, contrives artificial phenomena under ideal conditions. He removes one complicating condition after another, one disturbing cause and then another, watching meanwhile the result, until finally the necessary condition and the true cause are discovered. On this method rests the whole fabric of the physical and chemical sciences.—*Popular Science Monthly*.

**CALIFORNIA OBSERVATORIES.**—There are in California 12 private astronomical observatories

where work is constantly being done and whose owners take a deep and intelligent interest in the study of the heavens. The history of astronomical science shows that many of the most important and useful discoveries have been made by private observers, using their own instruments and working entirely unaided by public or private beneficence. So well is this recognized that every modern writer on the history of astronomical discovery acknowledges the obligations of the great observatories to the small ones, and of regular astronomers to the volunteers.

**THE ORGANIC CIRCLE.**—The idea of indestructibility and ceaseless change of matter leads to curious reflections. Sir Henry Thompson has remarked that when an animal body decomposes, whether the process occupies four hours, four months, four years, or even 4000 years—any one of these periods being quite possible—those elements which assume the gaseous form mingle at once with the atmosphere, and are taken up from it without delay by the ever-open mouths of vegetable life. By a thousand pores in every leaf the carbonic acid which renders the atmosphere unfit for animal life is absorbed, the carbon being separated and assimilated to form the vegetable fiber, which, as wood, makes and furnishes our houses and ships, is burned for our warmth, or is stored up under pressure for coal. "All this carbon has played its part, and many parts, in its time, as animal existences from monad up to man. Our mahogany of to-day has been many negroes in its turn and before the African existed was integral portions of many a generation of extinct species. And when the table, which has borne so well some 20,000 dinners, shall be broken up from pure debility and consigned to the fire, thence it will issue into the atmosphere once more as carbonic acid, again to be devoured by the nearest troop of hungry vegetables—green peas or cabbages in a London market-garden, say—to be daintily served on the table which now stands in that other table's place, and where they will speedily go to the making of 'lords of creation.' And so on, again and again, as long as the world lasts."

**SEALS WITH BALLAST.**—The seals are carnivorous mammals, divided into two classes—the Pinnipeds, or common seals, with rudimentary ears, and the Otariidae (sea lions, bears, elephants), which have the ears developed. In a late paper before some British naturalists, Dr. A. J. Harrison stated that the Otariidae, which inhabit the waters of the southern hemisphere, are supposed by the fishermen to have an intercal pouch in which rounded stones are carried to enable the animal to sink below the sea's surface when fat. Observations have shown, however, that the so-called "ballast-bag" is only the stomach. To account for the presence of the stones in this organ, it has been suggested that they are intended to aid in the trituration of food, while other persons believe that they have been accidentally introduced with the food, or in play. Similar rounded stones have been found in seals and sea-lions which have been confined in London, and the stomach of a Newfoundland seal which died at Clifton in 1886 contained gravel, nuts and pieces of sticks.

**SCIENTIFIC VISITORS.**—The first instance of the holding of a regular meeting of an English scientific society in this country will occur next fall, when the Council of the Iron and Steel Institute of England will meet here, probably in December. They come upon the invitation of the American Iron and Steel manufacturers. Two hundred and fifty members, including some of the most prominent manufacturers and scientists of England, Germany, Westphalia, Sweden, Italy, and Spain, have promised to attend the meeting. A large number of English scientists were present at the last meeting of the American Society as visitors; but the meeting above referred to will be the first instance of a regular meeting in this country of any foreign scientific society.

**A NEW DISINFECTANT FROM COAL OIL.**—We read in *Le Monde Pharmaceutique* that a new disinfectant of great energy has been introduced in Paris. It is a brown liquid of airy consistency. Water is turned milky by a small addition, and the odor imparted is not disagreeable. An examination of the product justifies the supposition that it is a peculiar saponification of coal oil by caustic soda. It is especially adapted for disinfecting localities where epidemics rage. It cures skin diseases in animals, and gives luster to the hair. It destroys moss and fungus on trees and plants. By sponging a horse with a solution (100 grams in 10 liters of water), flies are kept off.

**ANTIQUITY OF THE SPINDLE.**—In the hieroglyphics over persons employed with the spindle on the Egyptian monuments it is remarkable that the word *sakt*, which in Coptic signifies to twist, constantly occurs. The spindles were generally of wood, and in order to increase their impetus in turning, the circular head was occasionally of gypsum or composition. Some, however, were of a light plaited work, made of rushes or palm leaves, stained of various colors, and furnished with a loop of the same materials, for securing the twine after it was wound. Sir Gardner Wilkinson found one of these spindles at Thebes, with some of the linen thread on it, and it is now in the museum at Berlin, Germany.

## USEFUL INFORMATION.

## Hemlock Lumber.

A recent exchange contains the following on hemlock lumber, which will be of general interest:

Scarcely any of the woods that promise a greater or less competition with pine are making more rapid progress than hemlock. There is every reason to look for a larger production of hemlock from the Michigan mills this year than was ever made before, and for its introduction on its merits into consuming districts where but recently it was pine or nothing. This wood, as it spreads out south and east from Michigan and other distributing points, will find itself met by hemlock from Pennsylvania, and finds itself also in presence of no mean competition. For some time back, in Central and Southern Ohio, the hemlock from the forests of Western Pennsylvania has been coming alongside of the pine from the lake markets and from Central Michigan, and in many cases beating its rival in a fair fight. Hemlock has the advantage of comparative cheapness, and that is, of course, a telling one. The difference of a couple of dollars or so a thousand usually turns the scale in its favor, and in consequence its use is growing wherever it has come into the market for sale upon its merits.

Hemlock makes a reasonably light, strong and durable timber, and there is no reasonable objection to its free use in building. As it is bound to come more and more into market, as the stock of pine diminishes and its cost advances, it is proper the trades should understand that it is not a timber to be despised by any one. It is to a great extent the bill-stuff of the future, though it seems its usefulness is not to be limited to so narrow a field as that and similar purposes. It proves a very successful material for shingles. Pennsylvania makers are turning out hemlock shingles with a 15-year guarantee behind them, and what is more, they are laying them down alongside of pine shingles at prices which the latter can hardly match. It is said that the timber which the manufacturers in the Keystone State are now cutting is much better than much of that which they have sent to market in times past. As they are compelled to go further back from the streams, and gather in the trees standing higher up in the mountains, they obtain a better quality of timber, freer from shake, and showing a finer and closer texture. It appears to be well liked by consumers, who buy the shingles freely under a warrant which they cannot get with any pine shingles they are offered, and which they know would be practically worthless if it were made. Within the past year the development of the Western trade in Pennsylvania hemlock has been very marked, and the indications are that its rise is but just begun.

**MECHANICAL APPLIANCES FOR RAPID NEWS-PAPER WORK.**—There is no branch of industry for which invention has done more during the past 50 years than in the line of newspaper work. True, but little has been done in the way of a more rapid setting of type; but in the press work, which is really the essential part of the mechanical work upon newspapers, most amazing wonders have been accomplished. It is within the recollection of the writer when 1500 impressions per hour were the best that could be done with the most approved printing machines in existence. Now, as we are told, the New York *Telegram* has just put in a press which is capable of turning out "75,000 *Telegrams*" per hour, or 144,000 sheets in the same time." In the construction of this press over 11,000 separate pieces are employed. Three separate plates rest upon its cylinder, and type or stereotype plates can be used indiscriminately. The New York *Tribune* has just put into its press-room three presses worth \$40,000 each, having an aggregate value of \$120,000, and an aggregate capacity of 72,000 copies an hour output. This will enable the *Tribune* not only to run off its daily edition in two hours and its weekly in about three, but also to fold the supplement sheets into the main sheets by machinery, and, in the daily edition, at least, to paste the two sheets together.

**AN IMMENSE FLOUR MILL IN MANITOBA.**—Work is now in progress on a mammoth flour-mill at Keewatin mills, says the *Manitoba Free Press*. The site selected is immediately in the rear of the railway station, and the magnificent water-power at that point will be utilized. The mill will have a capacity of 1000 barrels per day. Adjoining the mill will be erected an elevator with a capacity of half a million bushels. The enterprise is in the hands of wealthy Eastern capitalists. In addition to the elevator to be erected at Keewatin, it is the intention to build elevators and storehouses at all the principal wheat markets in Manitoba. This will be the largest mill in the Northwest Territories, as Ogilvie's mill in Winnipeg, which at present occupies that position, has a capacity of 800 barrels a day.

**A THOUGHT FOR INVENTORS.**—Some one has asked, "Will a mechanical animal ever be invented?" That is, will a machine be so constructed that it will take the mechanical energy in food and change it to motive-power? A horse, for instance, is a machine. The feed of oats that is given him in the morning is converted, by the stomach, into

mechanical energy. A part of this energy must be used in building up his body or repairing waste tissue. Now, if a machine can be constructed which will take the feed of oats and by some chemical process, similar to the action of the stomach, generate available power, there would be a great saving of energy, as all of it could be utilized, none being necessary for the construction of the machine or its repairs. There is a wonderful power stored away in a little food. A man will take, in the morning, a small piece of beef and a couple of potatoes, a slice of bread and a cup of coffee, and from these his stomach will get power enough to carry his 200 pound body around all day, besides feeding the brain and keeping a proper reserve. Science has not yet been able to find a generator of power equal to the stomach, but perhaps it will. Who can dispute it?

**TO SILVER SILK RIBBONS.**—Make a solution of nitrate of silver, and add a little gum to it, so that the liquid will not run. Then, with a camel's-hair pencil or a quill pen, draw any sort of ornamental figure on the silk. After the drawing is dry, hold the ribbon over a vessel containing water, zinc and a little sulphuric acid. In a short time the silver will be reduced and adhere quite strongly to the fabric.

**A NEW BUTTONHOLE ATTACHMENT.**—The announcement comes from Boston that a buttonhole attachment for sewing machines has at last been perfected and will soon be put upon the market. It is described as a marvel of mechanism, every part in it having direct and well-defined movements, regulated by set screws at will, to produce buttonholes of any size or form required.

**A LARGE SPAR.**—A piece of timber was recently made into a spar at Seattle, W. T., which was 86 feet long and 30 inches in diameter at the deck, or 20 feet from the base, while at the small end the diameter was 27 inches, and there was not a knot or blemish to be seen. It contained 5504 feet, and cost \$15 a thousand at camp. As a spar it will cost \$175.

**RENEWING TIMBER LAND.**—Some of the older States are renewing their growth of timber, thus tending to allay the fears of an eventual exhaustion of the timber supply. In New England there is a vigorous second growth of white pine, where the forests are already yielding between 200,000,000 and 300,000,000 feet of timber annually.

**WHEAT IN BRAZIL.**—The cultivation of wheat in Brazil on an extensive scale is a question now occupying the attention of the agriculturists in that empire.

## GOOD HEALTH.

## Causes of Sudden Deaths.

One source of sudden deaths is accidents, but many events pass under the head of accidents which might have been foreseen and guarded against. Americans, particularly, are apt to take great risks—for example, in their eating, their clothing, their building, in crossing railroad tracks and in many other ways. No staging need ever fall, and it would not if proper care were taken in the choice of material and in construction. Think of the frightful list of deaths resulting from the use of oil poured on a lighted fire to cause it to kindle more quickly!

With many other causes of sudden death, our own personal ills seem at first sight to have almost nothing to do. There may be a fatal break in the physical machinery at a point where weakness has not been suspected. The heart, perhaps, becomes unnaturally enlarged, or its tough, muscular fiber turns to fat, and suddenly there is a mortal rupture; or the enfeebled heart fails to send blood to the brain, and the man drops dead in the street or at his business, or, more fortunately perhaps, in the midst of his family.

In other cases there may be a degeneration of the cerebral artery, and high living, or a glass of wine or an excitement of passion, may arouse the heart to send the blood to the brain with a force too great for the weakened arterial walls to withstand. These walls give way at one or more points, the outpoured blood presses against the nerve centers, and thus is cut off the necessary supply of nerve force to vital organs. The man falls unconscious and within a few days dies.

We have not space, says a cotemporary, to speak of other causes somewhat similar, but in most of them the weakness of the link at which the chain breaks is due to overexertion, to too continuous brain work, to excesses in eating and drinking, to passion, to worry. The weak spot being ascertained, the fatal result may be prevented for years, perhaps indefinitely, by a carefully regulated life.

**WINDOW CURTAINS.**—Eminent oculists inform us that in the majority of cases in which the eye-sight has been impaired, it has been caused by facing the light when at work. When we wish to read we sit down in front of the window. We place the sewing machine where it fronts the light. We push the writing-table into the full glare of noontide. All these habits work great evil to the eyes. No part of the human organism is more delicately formed or more sensitive to physical abuse than the

eye; and we are careless of its welfare as though ill treatment could not affect it. A little thought would prevent much mischief. The arrangement of window drapery should have reference to a few hygienic rules that would promote the health of the eye. A side light is the best to work in, and if a strong light is necessary, it should come from the upper half of the window. We are glad to notice the beginning of a reform in lighting our own rooms. Fashion seems inclined to aid us by approving a style that is healthful for the eye. Now, the lower half of the window may be curtained, leaving the upper half uncovered, in libraries, sewing-rooms, and in all the apartments of the house where most of the work is done. This is as it should be, sensible and hygienic. In all our houses we can adopt this style, so simple and inexpensive, and thus help to preserve in its vigor a sense so useful to us as the sense of sight. If the eyes are properly cared for during the growing period, and afterward, who knows how far the years of failing sight may be pushed into the future?

**PHTHISIS AND THE HOUSE FLY.**—The mosquito's share in the economy of nature, says the *Medical Record*, has always remained a mystery, except that it seems to bring out an interesting cutaneous eruption and reduce the price of board in certain districts of New Jersey. The house fly, however, has been credited with some general usefulness as a scavenger. This important function, if it really exists, is offset by the facts now accumulating which show that the fly is at times a carrier of contagion. M. M. Spillman and Hansbater, in particular, have recently shown at the Academy des Sciences the important role which the house-fly may play in the dissemination of tuberculosis. The intestines of flies that have fed on phthisical sputum, and the excreta of these insects, are found to contain the bacilli of tuberculosis. Flies that have fed on such infected matter may deposit the bacilli on windows, tables, food, and indeed may spread potential infection everywhere throughout an apartment. When the fly dies its body desiccates, setting the bacilli free and still capable of growth. The house-fly has thus an immortal part in the shape of pernicious microbes. The idea that this insect may carry contagion is not a new one. The contagious ophthalmia of Egypt is believed to have been spread largely through the flies. Bacteriologists have noticed how readily cultures may become infected by flies, and Koch admits that these insects may be the vehicles for the distribution of cholera. Yellow fever has been spread, it is thought, by mosquitoes, and perhaps also by flies. Facts are accumulating to show that the fly may be not only an annoying but a dangerous factor in a household.

**OATMEAL AS A FOOD.**—Oatmeal as an article of food is fast becoming popular with the English-speaking races, as rice is with the Orientals. It is deservedly popular because it contains nearly all the elements that make perfect nourishment for the physical nature. It has 65 per cent of starch, 20 per cent of the nitrogenous principles, and some sugar, gum and oil. But little more is needed for developing a healthy body, and, as an example of its use, we have the yeomanry of Scotland, with whom oatmeal is almost exclusively the article of diet. As a result, we find a people possessing all the characteristics of perfect health and vigor of body and mind. The firm, well-rounded muscle, the clear complexion, the silky glossiness of the hair, are more the result of their oatmeal diet than of any other one thing. Years ago, when Dr. Johnson first published his dictionary, he defined oats as a grain, which in England was fed to horses, in Scotland to men. An old Scotchman pithily remarked: "And where else do you find such horses, and where else do you find such men?"

**BOVINE VIRUS,** or that taken directly from the cow, is undoubtedly the best that can be used as a preventive from smallpox, where proper precautions and arrangements are made for obtaining it, and where it can be obtained fresh and pure. Such virus is always reliable and is to be recommended. But there is strong reason to believe, and such is the opinion of the highest authorities on this subject, that humanized virus, obtained from the arm of a healthy child, loses none of its protective efficacy, even when propagated through generations.

**DANGER OF BOXING THE EARS.**—*Science* publishes some valuable records, collected by Dr. Samuel Sexton, on the effects of boxing the ears. In 51 cases upon his records the ear has been injured by blows of the open hands or fist. One had inflammation of the ear, and the other had the running of the ear for 12 years. This patient died of brain disease. In another the patient was elated by his father on the left ear, and deafness ensued, with a bloody discharge, from which he was three months in recovering.

**LONGEVITY.**—The three most remarkable cases of long life are those of Thomas Parr, Henry Jenkins, a Yorkshireman, and the Countess of Desmond. Parr lived to be 152 years old; Jenkins is said to have reached 169 years, though the case is not so well authenticated. The Countess of Desmond reached 142 years. It would appear from the recent reports of individual cases that the present was about to become a special era of longevity.

## ENGINEERING NOTES.

## The Two Great Canals.

Almost simultaneously with the failure of De Lesseps' latest lottery scheme for raising the money to complete his Panama canal, comes the announcement of the departure of a corps of engineers from New York for Nicaragua, charged with instructions looking to the actual inauguration of work upon the much-talked-of canal across the isthmus of that name, under the joint patronage of the Governments of the United States and Nicaragua.

The Nicaragua route for a ship canal has always been regarded with especial favor by our government engineers, and in many respects presents decided advantages over other routes that have been proposed. It is much further north than Panama, a fact which means a saving of several days with vessels bound to and from more northerly ports; the climate is excellent; comparatively little rock or earth excavation will be required, from the fact that the great lake of Nicaragua and the San Juan river furnish a natural water-way for about three-fourths of the route; it is believed that excellent harbor facilities can be formed at both termini; and the cost of construction will be very much less than that of any other. These are advantages which are not possessed by any other route. Although this canal will be largely incommoded by quite a series of locks, its other advantages will more than counterbalance the Panama scheme, itself incumbered with the now definite certainty of several locks. Should both be constructed, the Nicaragua canal will, undoubtedly, receive the lion's share of the traffic between the two great oceans.

De Lesseps has shown himself to be a most indefatigable man. He still insists that he is going to complete the Panama canal. He admits that there has been miscalculation, and even a waste of money and materials; but he still has, or affects to have, the most unbounded confidence in the future, and to be sure of ultimate success.

His latest scheme, that of issuing lottery bonds in aid of the finances of the canal company, was opposed in the French Parliament and failed of passage, but he is still confident, and says that his backbone consists in the savings of France. He recalls his speech once made to the Emperor of Germany, in which he said that he found his capital in the woolen stockings of France, meaning, as he explains to the Emperor, the stockings in which the peasants, workmen and small tradesmen store their savings—a few sou every Saturday night.

The *British Trade Journal* thinks that the canal will be ultimately finished, but possibly by American capital. That journal says: "M. De Lesseps and his shareholders are in a terribly awkward plight. They cannot very well abandon works which have cost over fifty millions of money, and yet they cannot with prudence go forward. They have two alternatives, and only two, before them. One of them is to sell the whole thing for say twenty millions to the Americans—who are quite willing to buy the concern—and the other is to suspend M. De Lesseps and to put in somebody who will personally superintend the works."

It will be a difficult thing to shelve De Lesseps—about as difficult a task as to complete the work itself. The old man is very cunning in keeping himself constantly before the French people, assuming that bourgeois air and style which so captivate them. He is frequently seen in Paris with some seven or eight of his eleven children, mounted on their ponies, he himself presenting the very ideal of the man of family and the model of the domestic virtues, and the French people say to themselves: "How can such a man as that, so good and affectionate a father, and moreover, the man who constructed the Suez canal, help succeeding at Panama?" and forthwith they dive down again to the bottom of the woolen stockings and produce some more of their hard earned sous for good old Papa De Lesseps.

Moreover, there may come a time when the small holders of stock may be so numerous and so politically effective as to compel the French Government to come to De Lesseps' aid and to nationalize the Panama canal enterprise. If a canal party should come into power in France the amount would not deter it from assuming the completion of the canal, especially if glory and the honor of the French nation became mixed up in the affair.

It is not impossible that France may take it up as an affair of State, though it is to be hoped that she will not, as it would surely lead to grave international complications. But, whatever may be said, the enterprise is going to be carried out some day. All the financial troubles which now beset M. De Lesseps will be overcome in one way or other, and the canal will be opened for business, though not at the time set by its builders, nor for the money they estimated, nor on the plans with which they set out. It will be a fixed fact, and will be a European link between the two oceans, a link which cannot be ours except at the cost of a war. It is time that we bestirred ourselves to provide an American link between the same two oceans which could not in any event be closed against our vessels by European cannon.

## MINING SUMMARY.

The following is most condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Alameda.

**COAL.**—San Leandro Reporter, Feb. 4: The Livermore coal mines, which have been lying dormant so many years for want of proper attention, have at last fallen into hands that will insure their development. Mendenhall & Guttman, the enterprising real estate firm of Livermore, have purchased the Jenkin Richards mine and commenced work. There are undoubtedly large deposits of coal in that section, and it will be a profitable commodity, when fuel is so much needed as at present.

## Amador.

**PLYMOUTH.**—Cor. Amador Dispatch, Feb. 4: Our town is very dull in a business point of view, since the mine got on fire, and if report is correct, is likely to be dull for some time, as we hear that the Empire is shut down for some time to come, and the Pacific will be the only paying mine to work. The covering was taken off the Pacific shaft last Saturday, and the miners succeeded in reaching the fire. They found it pretty well smothered out, but were afraid to get too far into the tunnel for fear of the gas. The shaft was closed up again to wait until to-morrow (Thursday), when another attempt will be made to get down and put out the fire. The talk is that pipe and hose will be laid into the tunnel and a stream of water with a good pressure will be directed against the fire, with the hope that it may be extinguished. It is understood that the New London has struck a very rich lead at the lower level of the mine, about 1100 feet from the surface. If so, it will make things lively here next summer. The New Chicago is working right along, and taking out some very good milling ore. Lamb & Wickem have struck a new ledge in the War Eagle that promises to pan out better than any strike heretofore made in this mine. H. P. Gordon is still driving his tunnel on Indian Creek, and expects big things when he taps the ledge.

**VALPARAISO.**—We understand that work will be resumed on the Valparaiso mine next week, and that the owners have concluded to put up a mill on the mine in the spring.

**SUTTER CREEK.**—Cor. Amador Ledger, Feb. 5: The mines are running regularly, with water in abundance. Rock is being extracted from the 400-foot level of the Wildman, and is said to be yielding well. The 10 stamps of the Iowa are in operation with good results. The four men who have leased a portion of the Lincoln, started 20 stamps of the mill last week, and expect to keep them steadily at work for some time. Sinking at the North Star is being prosecuted with all possible speed. George Allen has six men employed in putting a wire fence around 1000 acres that he purchased a year ago from the Vogan estate near Mountain Spring. It will take about a month to complete the job. Knight & Co's foundry has received an order for an eight-foot water-wheel for the Ilex mine; also an automatic valve for the same place. They are also getting out a 17-inch pump for Plumas Eureka mines, and the large hydraulic engine which they have been working on for some time, and which will be ready for shipment in about five weeks. They have also secured the contract to put up hoisting works at Quaker City, Calaveras county, which they expect to have completed in about two weeks.

**HUNT'S GULCH.**—Cor. Amador Ledger, Feb. 5: The one-stamp mill at the Sargent mine is pounding away on some very good rock. The Cleveland mine above Big Bar bridge is the scene of activity. The site has been prepared for the 5-stamp mill, and a contract let for the erection of the same. Men are busy taking water out of the shaft preparatory to hoisting rock. Considerable pay rock is in sight, the richest of which is a kind of ribbon quartz, showing some free gold and galena sulphurets. Some think the company would be justified in the erection of a 10-stamp mill. Col. Robinson, the superintendent, however, is content with five stamps for a starter, and will add more as circumstances warrant. I am told that Ginocchio Bros. have purchased the Huntington roller quartz-mill on the Amador Queen No. 2, and will move it to the Valparaiso, to work the rich ore taken from that claim.

**NEW LONDON.**—Amador Ledger, Feb. 5: We hear that the New London struck the ledge again at 1100 feet, and found rich rock. The New London has always been considered a very favorable location, and since the present parties have come into possession of the mine they have gone right ahead, not prospecting, but developing a mine with a certainty of success, and we have reasons for believing that it won't be long before it will be one of the richest paying mines on the mother lode. The New Chicago Mining and Milling Co. are taking out some good rock. We were shown some pieces of rock from the mine that were literally hung together with gold, and we understand that there is an abundance of rock that will pay \$8 or \$10 per ton. We have just heard that the old Empire mine will be let rest for awhile, and all the work that will be done will be in the Pacific. It will throw a good many men out of employment here if this program is carried out.

**KENNEDY.**—At the Kennedy mine it is the intention to sink shortly. Fifteen or 20 men were discharged this week, whether preparatory to sinking is not known. At the big tunnel at Middle Bar there is but little doing. The men are waiting for payday, which is to come next Monday. At the Amador gold mine operations are confined to one shaft, on account of lack of timbers. The Plymouth Consolidated Mining Co. of California will pay, February 6th, Dividend No. 57, of 40 cents a share, aggregating \$40,000, making \$80,000 paid this year, and \$2,280,000 paid to date.

## Calaveras.

**THE MINES AND MILLS.**—Angels Echo, Feb. 1: Although the recent cold weather has interrupted mining and milling operations in this vicinity for a few days, the mines and mills have all started up again and are at present in full operation. The Nevills mine is running full-handed day and night, and stopping is going on busily on the different levels. The mine never looked better than at present, and the ore now being mined and milled is said to yield excellent returns. The Uica, situated north of the

Nevills and adjoining it, is running in full blast night and day. Stopping is being carried on actively in the old works, and also in the new works. The ore now being mined in the old works is said to be of a good milling grade, but is far surpassed by that mined at present in the new works. The mill is kept in constant motion and the battery plates present a very healthy appearance. The new concentrators recently put in position in the mill will soon be in readiness for operation. The Angels Mining Co. is pushing developments with a vim that betokens ultimate success. Everything on the surface is being put in a condition that will admit of working the mine on an economical and systematic scale. In the meantime, extensive developments are being made in the mine. This mine is, without a doubt, destined to rank among the leading gold-producers of California. McCreight & Co's new mill at Albany Flat is now kept steadily in motion and the ore being crushed is said to be of a high grade. Many persons have heretofore thought that this mine was only what is generally termed a pocket lead, but developments have demonstrated the fact that it is not only a milling lead, but one of immense width and of great value. The members of the Jack Rabbit Mining Co., who have been for some time engaged in running a tunnel through the hill for the purpose of getting water to work the mine which is situated near Monarchville, have completed 800 feet, and there remains 800 feet more to be run. It is rumored that operations will be resumed on the Gold Cliff mine.

**ANGELS.**—Calaveras Prospect, Feb. 3: The mining interests in and around Angels are looming up with flattering prospects for an active season.

**COPPER.**—The copper interests of Calaveras, at Copperopolis and Campo Seco, are not lying dormant. With the rise in that metal and the market demand for it, this county will yet see great enterprise shown in the development of its copper mines.

## El Dorado.

**TAYLOR.**—Georgetown Gazette, Feb. 2: The pump at the Taylor mine has been started up after being stopped a short time. The mill will now be repaired and more extensive work will be commenced. Mr. Chester and two other St. Louis gentlemen were at the mine last week.

**ALPINE.**—The contract for the crosscutting at the Alpine mine has been let and work has been commenced.

## Inyo.

**PANAMINT.**—Inyo Independent, Feb. 4: Panamint is rapidly coming up as a busy and prosperous mining camp. At least 40 men are now at work for the Surprise Mill and Mining Co. Most of these are getting out ore. Already a large amount of ore is on the dumps of the company's mines; this will be delivered at the mill as rapidly as the pack-trains can move it. According to last report from the camp the new mill would now be started up, as everything was in readiness for a start when the reporter left there. There is more ore in sight at Panamint than at any other mining camp within the knowledge of any one in this part of the country.

## Nevada.

**BRUNSWICK.**—Grass Valley Union, Feb. 2: The Brunswick people are just now very busily engaged in putting things in shape. A force of men, under the direction of Mr. Wm. May, are repairing the batteries of the mill and making a general overhaul of the entire mill work, and with favorable weather they will have the work completed so that crushing can be commenced within two weeks. The six-inch pump has been taken out of the shaft and an eight-inch one put in its place. This latter pump, running at the rate of eight strokes per minute, lowered the water to level No. 2 (300-foot level) in a comparatively short time. The late heavy snows and freezing of the water ditches compelled the shutting down of the pumping and hoisting works at the Brunswick, and in consequence the water accumulated in the mine. In conversation with Manager Fletcher and Supt. Tilley, yesterday at the mine, they informed us that the water would be entirely out of the No. 2 level by Friday, when the hoisting of ore would be commenced. An ore bin, having a capacity of 70 tons, has been constructed midway between the mill and hoisting works, and it will not be long before the receptacle is filled with mill rock. The two Duncan concentrators ordered for the mill have not yet arrived, but are expected on any day.

**YOU BET DOINGS.**—Foothill Tidings, Feb. 4: Mr. Goodwin brings us the cheerful news that after sinking an incline to the depth of 200 feet and then drifting a like distance, the South Yuba Co. reached the gravel channel on Thursday. Excellent prospects are obtained, and it is a certainty that the lead can be worked by the drifting process at a profit. This ground is situated between two claims which have been worked out but which were very rich, and it is furthermore known that in the South Yuba's claim the channel makes a sweep. Wherever such occurs, fabulously rich gravel is always found. Mr. Goodwin is positive that within a year from 50 to 75 men will be employed by this company and that You Bet will in a measure experience the prosperity of former years.

**DERBEC MINE SHUT DOWN.**—Grass Valley Union, Feb. 8: The Derbec gravel mine at North Bloomfield has been shut down until a reduction can be effected in the price of wages. It is reported that the mine has yielded \$150,000 the past year, all of which has been paid out for lumber and running expenses, leaving nothing for the stockholders. The directors propose to cut down expenses so that a margin of the profit will be left to the company. Heretofore, miners have been paid \$3 per day. An attempt was made some time ago to reduce wages to \$2.50 per day, but it was unsuccessful. It is thought the suspension of the mine will be but temporary, as there is a hope that a compromise will be arrived at between the company and its employees on the wages question.

## Sierra.

**SHUT DOWN.**—Grass Valley Union, Feb. 5: The Alaska quartz mine at Pike City has shut down owing to a strike of the employees, about 100 in number, on account of overdue wages. Though a mine that has been praised much for its richness, the Alaska is nearly all the time in financial straits.

**MILL RUNNING.**—Mountain Messenger, Feb. 4: The Gold Bluff mill is running night and day, on splendid rock that had accumulated during the cold weather when the water-wheel was ice-bound.

## Tuolumne.

**TUTTLETOWN.**—Union Democrat, Feb. 4: The Long Gulch mine on Mormon creek is looking exceedingly well, and the work of hauling the mill is going forward with dispatch. The Ritchie mill has its mortar blocks in position and mill-house completed. The Rowe & Gill enterprise is doing well, and six stamps are continually in operation. The ore thus far has averaged \$12 per ton in free gold. The sulphurets have not been tested.

**EAGLE CREEK.**—Tuolumne Independent, Jan. 28: Flattering prospects are being obtained from the Eagle mine, on Eagle creek. This mine is owned by Messrs. Tibbitts of Columbia and Clark of San Francisco. Considerable work has been done, and the mine promises to be a permanent and paying proposition. The Hart and Jacobs mine, owned by Messrs. Hart & Fallon, has been sold to the same company that bought the Ham & Birney mine, of which the Hart & Jacobs location is an extension.

## Trinity.

**DEADWOOD QUARTZ.**—Trinity Journal, Feb. 4: Charley Gilzean of Deadwood was in town the first of the week and gave us the following items in regard to recent developments in Deadwood quartz: Gilzean & Barrows, who leased the Little Gem from the Gibson Bros. last fall, are now working on the east end of that mine with good results; they have run in a tunnel on the vein for a distance of about 80 feet and the ore is of the same character as previously taken out, averaging about \$300 to the ton. The ledge in the tunnel is eight inches in width and of good quality. They have about 9 tons on the dump which they will crush in Gibson's cannon-ball mill. On the west end of the same ledge, Weyand & Clement are working on very rich rock; they have run in about 200 feet of drift on the ledge and are taking out as good rock as ever. They have an unusually good thing in quartz, as the ore is high grade and they have quite a body of it. A. D. McDonald and Bert Kellogg recently bought out Jud VanMatre's lease of the Monte Cristo, which he had received from the Brown Bear Co., and, the next day after taking possession, went to work in the old tunnel, and driving ahead, struck a 12-inch ledge of ore of the same quality that has made the Monte Cristo famous in the camp. The last lot of ore taken from this mine and crushed in the stamp-mill belonging to the Brown Bear Co. went over \$200 to the ton, and Mr. Van Matre thinks the new strike equally good.

## NEVADA.

## Washoe District.

**BELCHER.**—Virginia Enterprise, Feb. 4: The 400 level crosscut is now in 38 feet, and the ground shows no change for the week. The 500 south drift has been advanced 29 feet; total distance, 138 feet. The ground in the face is of a favorable character, consisting of clay, quartz and porphyry, with some water. The Suro tunnel drift is out 1180 feet.

**OCCIDENTAL.**—At the end of the south drift on the upper tunnel and at the top of the south winze an east crosscut has been extended 10 feet. At the top of No. 2 upraise south of the north incline winze have drifted south 11 feet. The south drift at the top of No. 2 upraise has been extended 10 feet; total length, 29 feet. Extracted 13 tons of ore. On the 100 level No. 2 upraise in the east drift north of the raise, the north drift has been extended 14 feet; total, 29 feet. On the 200 level at No. 3 upraise have extended the north drift 5 feet; total, 25 feet. In the north incline winze 25 feet above the 200 level have extended the south drift 10 feet; total, 18 feet. The ore extracted on this level is held in the mine.

**HALE AND NORCROSS.**—On the 400 level the north and south drifts have been advanced 20 feet. The south drift continues in low-grade quartz. The north drift shows stringers of good ore. On the 700 level the ore development shows further improvement. The drift north from the top of the north upraise is now advanced 55 feet and continues in excellent ore. We have extended this upraise two square sets higher since last report in high-grade ore—its total height being 108 feet. The south upraise is now 77 feet above the track floor and continues in ore of good quality. We have hoisted and shipped the usual quantity of ore to the Vivian mill and have bullion on hand amounting to about \$32,000.

**CROWN POINT.**—The 500 raise is now up 75 feet. At a distance of 70 feet up the clay wall was cut and then into a very fair grade ore. Contrary to expectations, the wall was found to be pitching 45 degrees east, showing that the ledge changed its dip at or immediately under the 400 level track, and that in order to intercept its downward continuation on the 500 level it will be necessary to crosscut east from the south lateral drift instead of west.

**SAVAGE.**—On the 600 level the south drift has been advanced 25 feet in excellent ore. We are extracting the usual quantity of ore from the several levels between the 400 and 900 stations. On the last-named level the west drift has been advanced 27 feet, and the improvement referred to in the last weekly letter continues. We have bullion on hand amounting to about \$30,000.

**ALPHA, IMPERIAL AND EXCHEQUER.**—On the 382 level of the Alpha shaft the favorable looking ground heretofore mentioned produces spots and streaks of good ore. The general tone and appearance on this level is most encouraging for the development of an ore body and the placing of these properties on a substantial paying basis.

**BEST AND BELCHER.**—On the 425 level west crosscut No. 3, 130 feet south of north line has been advanced 50 feet. The formation is quartz, showing value by assay. Upraise No. 1, started from a point 30 feet north from the south line, has been carried up 25 feet. The raise is passing through quartz showing low value by assay.

**GOULD AND CURRY.**—Are still prospecting on the 250 and 300 levels for ore. Have extracted 50 tons of fair-grade milling ore. On the 1300 level the south drift from the east drift has been extended 42 feet; total length, 233 feet. The formation is porphyry and clay.

**YELLOW JACKET.**—Extracting the usual quantity of ore and shipping the same to the Brunswick mill. There is no definite information of the ore find on the 1100 near the Confidence line, further than that the explorations continue to improve.

**UTAH.**—On the 472 level in the north drift 335

feet from the west crosscut No. 5, east crosscut has been extended 45 feet; total, 93 feet. The formation is porphyry and clay.

**JUSTICE.**—Are upraising to connect the 400 level with the 340 level, and drifting southeast and north. There are nearly 1500 tons of fair-grade ore on the dumps.

**CHOLLAR AND POTOSI.**—Extraction of ore on the several levels and the usual prospecting work going on. The mill runs steadily and most satisfactorily.

**SCORPION.**—On the 300 level the north drift is advanced a total length of 80 feet and the south drift 74 feet. Both are in vein material.

**SEGREGATED BELCHER.**—The south drift from the raise was advanced 20 feet; total length to date, 106 feet.

**ALTA.**—The regular work of extraction of ore and prospecting work is being done.

**WEST CON. VA. AND CAL.**—Sinking the shaft and making good progress.

**BULLION.**—Cutting out a station on the 500 level preparatory to drifting.

**BENTON.**—Drifting on the 725 level, without change to report.

## Eureka District.

**ORE SHIPMENTS.**—Sentinel, Feb. 4: During the past week ore shipments were made from the mines of the district as follows: To the Richmond Reduction Works from the Silver Lick mine, 38 tons; Seventy-six mine, 7 tons. Jackson mine, 22 tons. Eureka Con.—Prospect mountain tunnel, 2 tons; Margu retta mine, 14 tons; Dunderberg mine, 14 tons; Lone Pine mine, 12 tons, and Bowman mine, 12 tons.

## Hawthorne District.

**AN INTERESTING DISTRICT.**—Walker Lake Bulletin, Feb. 1: Nearly all the districts in Esmeralda county are preparing for more than usually active work this year, but some of them will attract an interest equal to that which will be displayed over the developments in Hawthorne district. The discovery of the Lapanta gold was a revelation to miners. So much being found near the surface on that claim incited the most zealous prospecting, but for a long time this prospecting was simply a search for places where money could be picked up from the ground with little more than the labor of stooping. Few such places were found, but, though the Lapanta showed that there was gold deep in the ground, the prospectors reluctantly gave up their search for treasure that did not need mining. However, by degrees miners began to sink on ledges, and, although there were the usual number of disappointments, there were enough developments to indicate the chances of wealth for those who went to work in earnest. For a time the Lapanta was closed, all the ore of high grade having been extracted, but at that time the Pamlico, in a distant section of the district, began to yield the rich rock which has made it famous, and which yield, making the allowances to which gold miners are accustomed, of the time required for passing through occasional bodies of barren or lower grade rock, has been continuous ever since. While the Pamlico was showing what might be expected from deeper workings, the lessees of the Lapanta opened a body of ore better than any previous deposit. This ore body in the deepest workings of the mine is still yielding, and were it now even completely exhausted the mine would be regarded by mining men as more valuable in a speculative sense than ever. Encouraged by the results in these two mines, other men have been doing systematic work and more are preparing to begin. The discoveries in the Narrow-Gauge and Green Isle are but types of what may be expected in any of the claims where real work is done on a reasonably promising surface indication. It is now understood that where one deposit of gold-bearing quartz has been found the probability of others of the same kind existing in the same ledge is almost a certainty, and the total exhaustion of all pay ore in sight will no longer be an inducement to miners to relinquish their exertions. Work will hereafter be steadily prosecuted and the variety of formation and developments in the several sections of the district will be unusually interesting to mining men of study and research, while the pecuniary results will be beneficial to those who stake their time and money against the rocky walls of the chambers where the gold lies hidden.

**HALF MOON BAY.**—Esmeralda News, Feb. 4: This mine is situated about the center of the mineral belt of Hawthorne district. The vein is of uniform thickness; the ore fair grade, carrying gold, silver and lead. On Thursday last Herb, Hartson and Syl. Light, the lessees thereof, shipped, in care of Selby & Co., ten tons of this ore, the product of the labor of two men for one month. The ore will certainly net them \$600. This is another of the many instances where the miner has been well paid for his labor on the mines of Hawthorne district. After attending to the shipment of their ore, Hartson and Light returned to their mine illumined by the Half Moon.

## Marietta District.

**GOOD PROSPECTS.**—Esmeralda News, Feb. 4: The prospect for Marietta mining district is, to say the least, most flattering. Many of the owners of mines there have been laboring assiduously to bring the old camp to the front and their efforts thus far have been commendatory. M. M. Comstock and others have an abundance of ore in sight in many of the different mines, while the dumps are groaning under the numerous sacks of ore waiting shipment. This revival of mining is due exclusively to the encouragement extended by the Candelaria W. W. & M. Co., the owners of the Georgene mill at Candelaria, in the matter of economical reduction of the ores of that district. In nearly all of the mines the click of the hammer and blasting sounds can be heard, while L. Lannoix of Belleville will hereafter be kept busy transporting the ore to Candelaria with his teams.

**ENDOWMENT MINE.**—Frank Higgs, who has been diligently at work on the Endowment mine at Marietta for some months past, has on the dump, as a result of his labor, 200 tons of milling ore of fair grade. Preparatory to having it worked, Mr. Higgs shipped a few sacks of the ore to the Georgene mill, at Candelaria, as a working test, and is so well pleased with the result obtained that he will have his ore shipped there for reduction.

## Rye Patch District.

**FAVORABLE.**—Silver State, Feb. 1: The mining outlook at Rye Patch is very favorable. The Butte Company's mine is looking exceedingly well and

producing rich ore. This mine is being worked by a Reno company, of which W. T. Hales is superintendent, and they ship the ore to the Reno Reduction Works. The Humboldt Queen, of which Mr. Sunderland is superintendent, is yielding large quantities of ore. The ore sheds are now full of ore, and the company will probably erect a mill next spring to work it. The Sunrise mine, near the Humboldt Queen, owned by Marion Howell, is said to have been sold to an English company, which will thoroughly develop it.

#### Tuscarora District.

**BELLE ISLE.**—*Times-Review*, Feb. 3: Fair progress has been made in extending the crosscut east on the 250-level. Rock continues very hard.

**PONDEROSA.**—East crosscut, since last report, has been extended 20 feet.

**NAVAJO QUEEN.**—Ground passed through in shaft this week still looks very favorable.

**FOUND TREASURE.**—Drift, 150-foot level, has been extended 22 feet during the week, and it has connected with the gangway, thus placing the main or new shaft in communication with the old works, and affording an abundance of fresh air throughout this level and the one above.

**NEVADA QUEEN.**—North drift on east vein has been advanced 10 feet; south drift nine. The ore has improved in quality very materially, the whole face being in fine ore with every indication of still improving.

**GRAND PRIZE.**—The stopes are furnishing the usual amount of high-grade milling ore. Owing to the hard quartz nature of the ore, the crushing capacity was very limited, and five more stamps have been fitted up, making 15 now running, and mill is doing good work. Average battery assays for the week, \$206.80 per ton.

**NAVAJO.**—South drift from west crosscut No. 2, east vein, 250-foot level, extended nine feet; total length, 85 feet. The vein is looking more favorable. West crosscut No. 1 from west vein, 150-foot level, was started the past week and extended seven feet.

**NORTH BELLE ISLE.**—Line crosscut, 300-foot level, has been extended 10 feet. No. 3 upraise is up 57 feet. Fair progress has been made in opening the first stope along the vein on this level. North drift from No. 3 crosscut, 70-foot level, extended six feet; total, 42 feet. Ore strata improving in width and grade. The stopes are looking as usual at all points, and the usual amount and different grades of ore is being extracted.

**COMMONWEALTH.**—The main shaft has been sunk and rimbers all into the 300-foot level, and will now be able to push the work of developing and exploring the 100 and 150-foot levels.

#### Wild Rose District.

**PARADISE VALLEY MINING COMPANY.**—*Silver State*, Feb. 7: Ore produced and delivered to the mill, Paradise mine, 71 tons. Average assay value in ounces per ton—silver, 10.21; gold, 0.06. Mill run 186½ hours and lost 5½ hours. Reduced 80 tons of ore and 40 tons of tailings. Produced 420 sacks of concentrates, 28,300 pounds, par value \$24.616, which were shipped to the Selby Smelting and Lead Co., S. F. Cal. The south drift from No. 2 west crosscut, Wild Goose lower level, shows about the same width of quartz as it did last week, but is carrying more metal than heretofore, with small bunches of medium-grade milling ore. The north drift, same mine and level, has improved greatly the last few feet. The face is about five feet wide, with more or less mineral for three feet, and about 15 inches of low-grade milling ore on the east wall. The vein appears to be widening quite rapidly, and the barren rock going out.

#### ARIZONA.

**TERRITORIAL NOTES.**—*Prescott Courier*, Feb. 1: Mr. Dolph of the Oro Fino Hydraulic Co. says they have fully 500 inches of water. As yet, but one pipe is used; the other pipe will be tumbling down grade in a day or two. Plenty of gold can be seen in the riffles. The Lynx creek hydraulic people are piping away. Lots of gold to be seen in riffles. Placer miners are busy in a dozen creeks and many gulches. Many of them are making big wages—from \$4 to \$6 a day to the man; others less. Gold taken out by these people is finding its way to Prescott. John S. Jones, manager for the Standard Milling and Mining Co., has a great many miners and others employed in Groom creek district. Miners have faith in Mr. Jones' ability to work their ores and are anxious for the mill to start. It is one of the best places in the mountains; surrounded by ledges, wood and everything necessary to give success. Mr. Cover, who is working the Tip Top mine under a lease, has several tons of shipping ore out. Chlorides near by are shipping plenty of ore. Col. Bigelow said yesterday that Dan Hatz has located an extension on the mine recently found by Bigelow & Smith, and that said extension was yielding as rich ore as the discovery claim. This ledge should be opened at once as the croppings promise well. Work is all the go in Weaver and Kirkland valley districts. Nevada and Colorado miners who recently went into the districts are so well pleased that they are working day and night. There is not a great deal of ore at the sampler, nor will there be until after roads and trails shall have dried a little. Mr. O. Floyd, who has come in from Turkey creek district, tells us of big strikes in the Scotch Lassie and another mine.

**OLD GLOBE.**—*Silver Belt*, Feb. 1: Upon invitation of Superintendent A. L. Walker, of the Old Dominion Copper Company, we made the circuit of the Old Globe mine on Monday last, our first visit since the resumption of work last month, and were gratified to find that so much had been accomplished in that time. Ore bodies on the second, fourth and fifth levels are looking well, and the ore in places improving in quality. Supt. Walker has had many difficulties to contend with, and it will be some little time yet before matters are running smoothly and to his satisfaction. The most important work recently undertaken is the sinking of a new shaft about 100 yards to the east of and on a level with the ore chute at the mouth of the tunnel. The location is the most eligible that could have been chosen, being much nearer the smelter than the Mooney shaft through which all the ore is now raised, and so situated that a tramway can be easily constructed from the shaft to the smelter, if at any time it is deemed advisable. Work on the shaft will be pushed with

all possible speed, and it is hoped that within five or six months it can be made available for the hoisting of ore. It is to be a double compartment shaft, fitted with two cages.

#### COLORADO.

**SILVER-LEAD.**—*Elk Mountain Pilot*, Feb. 2: As to the number of claims producing silver-lead ores in this vicinity we will say that their names are legion, a few only of which we can mention. Among the most promising showings for a large product is the Daisy mine, situated in Redwell basin, about six miles from Crested Butte, and less than two miles from the terminus of the Rio Grande railroad at the breaker. Recent developments are proving this to be a wonderful ore deposit. An immense ore chute was opened some time ago, which extends in the same course of the vein for a long distance, which is about 35 degrees from a horizontal. The vein rises from the basin and cuts into Redwell mountain to the south. The largest deposit of ore yet encountered lies on the floor or footwall, where is found a solid deposit of galena and sand carbonates of from four to eight feet in thickness and continuous as far as explored. The ore is picked and shoveled out as easily as the contents of a sand bank. The mine is in shape to take out from 10 to 30 or possibly 50 tons per day when the season opens. There are other silver-lead properties in the vicinity that promise shipping ore in the near future, also some just over the mountain that are likely to produce some fine ore the coming season. There are numerous claims located in Bixler basin which are meritorious and if worked will produce ore for shipment, viz.: the Excelsior, Jacob Strader, Gift, Domingo, Big Strike and others.

#### DAKOTA.

**LEACHING WORKS.**—*Black Hills Pioneer*, Feb. 1: The Deadwood Reduction Co. has recently been in receipt of reliable advices that Prof. R. D. Clark will now reach the hills in a very short time. Pending his arrival or receipt of a letter now said to be on the way hither from Cortez, no decided action is proposed toward erection of plants. Conversation with Messrs. Kingsley & Biding of the company, adduced, however, that the arrival will be the signal for the inauguration of active operations, and that leaching works of not less than 40 tons daily capacity and more probably with capacity for reduction of 100 tons of ore per day, will be built at once. All preliminary details have already been arranged, and nothing now remains but to carry the ideas into execution.

**MANITOBA.**—On the Manitoba lode, lying between the Caledonia and the High Lode Extension, and owned by the Manitoba Co., not a little development work, with extremely encouraging results, has already been performed. The claim was originally located in 1879 and relocated by J. C. Jones, in 1885. Since the latter date two shafts have been sunk, one 30 and the other 50 feet deep. A tunnel now 100 feet long, intended to cut the latter shaft, when it has reached a greater depth, has been started. In the bottom of the 50-foot shaft, free milling ore, assaying from \$5 to \$50 per ton, has been found. The proximity of a large ore body is known, and when work is again inaugurated at an early date in the spring, it is probable this property will be developed into one of the best in Whitewood district.

**HOMESTEAK.**—*Deadwood Pioneer*, Feb. 3: The Homestake people are contemplating a change of their method of reducing ores, for the purpose of largely increasing the capacity of the present works. Instead of the system of stamps now used, the company has in view a steam stamp.

**ORO FINO.**—Superintendent Allison brought in from the Oro Fino Thursday a handsome gold brick, the mine's regular monthly contribution to the Black Hills output of the precious metals. Twenty stamps, the mill's full capacity, are constantly dropping on a good grade of ore mined from the 200-foot level.

**ONTARIO.**—Fred, Sebastian and W. A. Delaney came in from Galena Thursday, to perfect arrangements for shipping ten tons of Ontario ore to the Iron Hill Smelter, for reduction. The ore will be transferred thereto next Monday. The lowest assays obtained from a number of samples gave a return of 31 ounces silver and 20 per cent lead, while others ranged from that to 80 ounces silver and 40 per cent lead per ton. The mine, located between the Hester A and Hays, is worked through a tunnel. Results to date have been of a very satisfactory nature.

#### IDAHO.

**FROM ERA.**—*Inter-Idaho*, Feb. 1: Mr. Coates, who is the only person who has got across from Era to Hailey since the big snow, gives a flattering report of the mines there. A very important strike was made on the surface of the St. Louis about the 8th of January, the ore running \$1000 to the ton. It is entirely distinct from the original discovery of the St. Louis, being 200 feet above it and 100 feet above the face of the tunnel. The vein runs north and south. Jim Smiley is the lucky man who found it. He is now taking out an average of \$1000 a day and has 3½ months yet to run on his lease with the privilege of working four men. The strike is in native copper, antimonial silver and sulphurets. The ore carries from 150 to 1600 ounces of silver to the ton; there being an eight-inch vein of antimonial silver which goes 1600 ounces. The gangue, 14 inches in width, which incloses this, yields 1000 ozs. to the ton. The Carrie Bell, owned by the Butler Bros., adjoins the Last Chance. The Carrie Bell tunnel, on which the owners have been driving all winter, is now about 60 feet from the Last Chance vein. The Utah mine is owned by Geo. Richardson, Wiley Jones and W. M. Crawford. Mr. Richardson is taking out some fine milling ore from it, which carries from 60 to 70 per cent of lead and from 60 to 80 ounces of silver. There is also a fine showing of ore on the Astopile, which is 1200 feet west of the St. Louis, on the opposite side of the hill and parallel with it. Ridley Roberts, A. W. Williams and Frank Cochrane are the owners.

**THE FLINT CREEK PROPERTY.**—*Butte Inter-Mountain*, Feb. 2: Supt. Frank M. Freyschlag of the Flint Creek mine is now in the city and reports work progressing steadily in the development of that property. At present they are running a tunnel to crosscut at a great depth the higher two of the veins

running through the company's ground. The lower vein has been opened at four places, covering a distance of about 300 feet along it. They have ore in all the openings—an apparently continuous body, but only from 12 to 20 inches thick. Their deepest incline in this part of the property is about 100 feet. Little attention has as yet been given to taking out ore, but he says they have a considerable quantity in sight and all of good grade.

**VIENNA.**—*Ketchum Appeal*, Feb. 4: Besides the mines owned by the Vienna Co., there are others in the district that deserve favorable mention and which have been more or less developed. Among them are the Solace, Emma, Lion, Elsie and the Nellie group. The Solace, owned by J. B. Haggin and Senator Hearst, was purchased in 1887 for \$30,000, when only an open cut of seven feet in depth had been made upon the ledge. This has been a remarkably rich mine; a considerable amount of work has been done, and there is no doubt but that the ore taken from the mine has paid all expenses thus far. The other mines referred to have had a limited amount of exploration work done upon them, but not enough to ascertain their true character or intrinsic value.

**OPHIR.**—The news received from the Ophir mine at Boulder states that the mine is still improving. An additional force of miners have been put at work during the week. J. F. Welsh and others who have a lease on the Sitting Bull mine at East Fork have recently struck a fine vein of carbonate and galena ore two feet wide. Reports of new finds in the East Fork locality are frequently coming in. The North Star mine is producing 14 tons of first-class ore per day, with only a limited number of men at work in the mine. McPheters' teams are delivering about 30 tons of ore per week from the North Star mine to the smelters.

**RESULT OF THE TRIAL RUN.**—*Coeur d'Alene Record*, Feb. 1: The cleanup of the trial run of 13 tons of Fay Templeton ore was made at the Golden King mill yesterday. The result is a fine gold bar weighing 22 ounces, 6 pennyweights and 5 grains, estimated at the Bank of Murray to be worth \$357, or \$16 per ounce. The result proves that the ore carries \$27 per ton in free gold, instead of only \$2.50 as W. B. Honeyman said after his little scheme to gobble the property was nipped in the bud. Aside from the free gold product, 145 pounds of concentrates were obtained, estimated by Mr. Riley, the amalgamator, to be worth at least \$20, or about \$300 per ton. When Messrs. Human, Krause and Klein left the mill the batteries had not been cleaned and Mr. Riley thought that about \$20 more would be obtained. If that is the case the ore is worth, including the concentrates, \$29 per ton. We are informed by the owners above mentioned that active operations at the mine will now be resumed, and that a milling contract will be made with the King company. They say the next run will be 100 tons. Competent judges estimate the amount of ore now in sight at the mine at 10,000 tons. There is not a property in Coeur d'Alene that can be more economically worked. We congratulate the owners and the miners of Pony gulch who rustled hard for grub while demonstrating their faith by their work. The result of the Templeton test means much for Beaver district and the entire north side. Three cheers for the gold belt and the "California immigrants!"

#### MONTANA.

**STRIKE IN THE GOLD HILL.**—*Inter-Mountain*, Feb. 1: It is reported to-day that the Diedrich Bros. and their partner, who have a lease of the Gold Hill property, back of the county court-house, have made a big strike in the property at a depth of about 160 feet. It will be remembered that a year or more ago some very rich silver ore was taken out of this property at a depth of about 60 feet, the ore being incrustated with silver. The character of the ore has since changed to copper, and they have now cut into a big body of it, the extent of which has not been determined, but they are into it seven or eight feet without having found the other side yet. Assays show the ore to carry between 20 and 25 per cent copper and eight to ten ounces of silver. The boys feel so good over it that they have shut down work for the day, and are properly celebrating the event, which promises to be of such vast importance to them. They have, it is understood, received a handsome offer for their lease, but refuse to sell. The property is owned by N. J. Bielenberg, W. A. Clark, and H. S. Clark.

**NOTES.**—*Butte Miner*, Feb. 4: Active operations have been commenced at the West Colusa. Messrs. Robinson & Co.'s lease on the Big Bonanza mine will expire March 1st, when they will move all their machinery to the Damarack, just north of Meaderville. The Morning Star mine is now turning out large quantities of rich ore. A lot sent to the Pueblo Works yesterday yielded 166 ounces of silver, and \$27 in gold per ton. The small mill of the Alice Co. is kept in constant operation on ore from the Alice mine. The fact that the railroad is being extended to the salt bins at the large mill indicates an early resumption of operations there. Mr. Hornbrook of the Pueblo Works says the receipts of custom ores are growing larger day by day, since the weather moderated. Mines can be worked near the surface now that could not be touched during the severe weather. The new boilers at the Mountain View have been placed in position, and the smokestacks were raised yesterday. A five-inch cable and double deck cages will be used. The air shaft is completed, and drifting commenced yesterday.

#### NEW MEXICO.

**SOCORRO NOTES.**—*Bullion*, Feb. 4: A mill is being erected for the treatment of ore from the Standard, a property in the vicinity of the Lone. The Humming Bird mine at Hermosa is under bond to H. B. Hamilton of Socorro. St. Louis parties are figuring on it. It is reported that John St. Charles with one helper took out \$7500 worth of ore in three days on his recent strike at Hermosa. Work has been revived in the Tierra Blanca district, and some fine-looking ore is being taken out of the different mines. In the Shakespeare district, matters are on the qui vive. A big mill is about to be erected and work on mines will be steadily pushed. The Pride of the West, located between the Iconoclast and Templar mines, has been purchased by Kansas City parties and will be developed. The

machinery for the Thomas concentrator at Kelly has all arrived at last, and will be put up without any further delay. John Baicher, a prominent Lordsburg miner, reports the condition of mining affairs in his district as very flattering. Among other properties in that district are the Fraction, Wynnan Volcano, Martha and John Smith, all of which are doing well. An Eastern company is considering the advisability of purchasing these mines. Chas. Myers had a carload of ore from his mine near Hillsboro treated this week at the Rio Grande Smelter Co. His ore run 4½ ounces gold and 116 ounces of silver to the ton. R. H. Hopper, one of the owners in the Templar and Virginian mines at Kingstons, has received his returns from the carload of Templar ore he had treated this week, by the Rio Grande Smelting Co. The returns gave over 700 ounces of silver to the ton. He says there is plenty more just like it where that came from.

#### OREGON.

**THE MINES.**—*Bedrock Democrat*, Feb. 2: The mining community look forward to the coming season with hopes for great activity in both quartz and placer properties. The winter has been most favorable for placer mining and a good season is assured. The past year noted grand development in quartz mining throughout this entire section, and on several properties mills have been erected. At the beginning of winter a lull in operations occurred on account of not being prepared to prosecute work in the deep snows, but everything is in readiness for the opening of spring, and we may confidently look for more active operations than ever when that time arrives.

**PLENTY TO DO.**—*Jacksonville Times*, Feb. 3: Water is quite plentiful and all of the miners have plenty to do. Logg & McDonnell of Forest creek are running on full time and will do well. The mining population of southern Oregon are quite busy and make the most of their opportunity. John Miller is operating his mines on Farmer's flat, which are rich, on a larger scale than ever. Saltmarsh Bros. of Sterlingville precinct have plenty of the aqueous fluid and will make the most of it. The Sterling Mining Co. has two giants at work and is making the gravel fly. A good season is prospective there. A. W. Sturgis of Forest creek has increased his supply of hydraulic pipe, and will make a better showing than ever. O'Brien & Berryman have started work at their new mines on Applegate and expect to make their first run profitable. The Jacksonville Milling & Mining Co. has suspended operations for the present, but will resume prospecting at an early date. It has expended over \$3000 during the past two years.

**THE CRACKER CREEK MINES.**—*Bedrock Democrat*, Jan. 30: The owners of the Cracker creek mining property, Messrs. Jonathan Bourne, Jr., and C. W. Knowles, are making extensive preparations for the working of the mine the coming spring. Development work has been industriously pushed all winter and the results have been most satisfactory. The mine is proving itself to be a veritable bonanza and there is every probability that the owners will erect an improved milling plant on the property next season. The purchase price of this mine was \$25,000, and to-day the owners would be loth to accept treble that amount for the property; in fact, it is said that they have expressed themselves that \$1,000,000 would not buy it. This is only one of the many properties in this country that are in waiting to fall into the hands of moneyed owners to show up their immense wealth.

#### UTAH.

**PARK NOTES.**—*Record*, Feb. 4: Work on the Fairview group northwest of the Massachusetts and owned by Chambers, Hollister and some Salt Lake bankers, is going ahead with favorable results. The small force of men have worked to good advantage developing this property. The incline shaft is down 200 feet on the vein, carrying ore all the way. Now the main work is being done on the 100-foot level, drifting on the vein east and west in ore. Ore taken from this level goes from 15 to 55 ounces silver to the ton with a small percentage of lead. This property has a true fissure vein and is in a quartzite formation. It looks now as well as the Ontario did at the same depth, and there is no doubt that when enough depth is reached the Fairview will be a good paying mine.

**ANCHOR.**—Work on the Anchor drain tunnel is going ahead as fast as possible through very hard rock. Wednesday afternoon operations were interrupted by the screw on the end of the piston rod of the air compressor which runs the Burleigh drills breaking. The damage was repaired and the next day work was resumed. If all goes well the connection from the tunnel mouth to the intermediate shaft workings will be made by March 1st, making the entire length about 3300 feet, or half the work done, and all since last August. After the connection is made there will be but one face in which to work. Word comes to the *Record* to the effect that a strike was recently made in Morey's Walla Walla tunnel property, just east of the old Parley's Park and the Ontario. The property is well developed, and the efforts of the owners are at last rewarded by a lot of fine-looking ore on the dump.

**ORE AND BULLION SHIPMENTS.**—During the week the Crescent shipped 126,100 pounds of first-class ore. Last Tuesday the Ontario shipped 29 bars of bullion containing 15,928.72 fine ounces of silver. On Wednesday, the 1st inst., eight bars of Duly bullion, 9297 fine-silver ounces, were shipped from the Marsac mill.

#### WASHINGTON.

**RETURNED FROM SALMON.**—*Ellensburg Capital*, Feb. 3: On Monday Mr. Brown returned from Salmon bringing three passengers with him. His return trip was uneventful and was made in less than a week. He found but little or no snow along the Columbia, and on this side it was rapidly thawing, making sleighing difficult. He thinks greater effort should be made to keep the roads open, and says they can be kept in good condition all winter. The miners of Salmon are all in good spirits and anticipate a great stampede this spring. They have been isolated this winter and hover about the stage on its arrival eager for letters and newspapers from the outside world.

## THE DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

## AN AUTOMATIC ORE FEEDER Rock Breaker.

Goes with each Mill. We also have a suitable

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

**TATUM & BOWEN.**

34 and 36 FREMONT STREET, SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

**HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,**

And renewals will not cost over one-half as much as for stamps. The attention of parties buying Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing.

Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case.

Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

## BATTERY SCREENS.

Best and Cheapest in America.

No imitation, no deception, no planished or rotten iron used. Only genuine Russia iron in Quartz Screens. Planished iron screens at nearly half my former rates.

I have a large supply of Battery Screens on hand suitable for the Huntington and all Stamp Mills, which I will sell at 20 per cent discount.

## PERFORATED SHEET METAL

For Flour and Rice Mills, Grain Separators, Revolving and Shot Screens, Stamp Batteries and all kinds of Milling and Milling Machinery. Iron, Steel, Copper, Brass, Zinc and other metals punched for all uses.

Inventor and Manufacturer of the celebrated Slot-Cut or hurred and Slot Punched screens.

Mining Screens a specialty, from No. 1 to 15 (fine).

Orders promptly attended to.

San Francisco Pioneer Screen Works,  
21 & 223 First St., San Francisco, Cal.

JOHN W. QUICK, Proprietor.

## Books on Working Ores.

By GUIDO KUSTEL, M. E.

ROASTING OF GOLD AND SILVER ORES (Second Edition) and the Extraction of their Respective Metals without Quicksilver. By Guido Kustel, M. E. 1880.

This rare book on the treatment of gold and silver ore without quicksilver is liberally illustrated and crammed full of facts. It gives short and concise descriptions of various processes and apparatus employed in this country and in Europe, and the why and wherefore. It contains 156 pages, embracing illustrations of furnaces, supplements and working apparatus. It is a work of great merit, by an author whose reputation is unsurpassed in his specialty. Price, \$3, coin, postage free. Sold by DEWEY & Co., Publishers, 252 Market St., San Francisco, Cal.

By C. H. AARON.

AARON'S LEACHING GOLD AND SILVER ORES, the most complete hand-book on the subject extant; 104 pages octavo. Illustrated by 12 lithographic engravings and four wood cuts. Fully indexed. Plainly written for practical men. In cloth, \$3. Sold by DEWEY & Co., S. F. BOUND VOLUMES.—Back files of this paper bound in substantial cloth binding with leather back, containing six months' numbers in each, indexed, can be had at this office at \$4 per volume.

WORKING ORE.—Miners who want a quartz mill, large or small, at one-eighth the cost of stamps, should investigate the new Stiles pulverizer and concentrator, both fully tested, and which are going to get to the front and stay there. Address J. A. Johnson, 105 Stockton St., San Francisco.

## THE GIANT POWDER COMPANY

Manufactures Three Kinds of Powder, which are acknowledged by all the Great Chemists of the World as

The Safest and Strongest High Explosives in the Market.

**GIANT POWDER or DYNAMITE,**

Of Different Strengths as Required.

NOBEL'S EXPLOSIVE GELATINE," which contains 94 per cent of Nitro-Glycerine, and GELATINE-DYNAMITE, Stronger than Dynamite and even Safer in Handling.

**JUDSON POWDER IMPROVED.**

FOR RAILROADS AND LAND CLEARING. Is from three to four times stronger than ordinary Blasting Powder, and is used by all the Railroads and Gravel Claims, as it breaks more ground, pulverizes better and saves time and money. It is as dry as the ordinary Blasting Powder and runs as freely.

**BANDMANN, NIELSEN & CO.**

CAPS and FUSE for Sale.

GENERAL AGENTS, SAN FRANCISCO OAL.

SPECIAL ATTENTION PAID TO CONCENTRATION OF ORES.

Ores Received on Consignment, Sampled, Assayed, and Disposed of in the Open Market to the Highest Bidder.

## Test of Ore-Feeders.

EDITORS PRESS:—There may be something of interest to your readers who are engaged in mining enterprises in the following relation of facts which have been brought to the notice of the writer.

It will be remembered that upon the opening of the exposition of the Mechanics' Institute, held in this city in October last, a Hendy improved Challenge ore-feeder was placed in position, on the front of which was fastened the usual name-plate which had been affixed to 1900 others which had been manufactured and sold and successfully operated. This name-plate bore the following inscription, viz.: "S1000 Challenge ore-feeder, J. Hendy, S. F., patented March 17, 1874." A day or two subsequently there appeared in the machinery department of the exposition a flaunting banner announcing that the Loftus ore-feeder accepted the challenge of \$1000, a feeder hearing that name being placed on exhibition.

Negotiations were entered upon and eventually culminated in each of the patentees of the respective feeders depositing, in a well-known bank of this city, the sum of \$1000, preliminary to the arrangement of a fair and impartial competitive test to determine the comparative merits of the two forms of feeders. Following this, the managers of the Experimental Mining Co., having erected a ten-stamp gold-quartz-mill on their mining property at or near Columbia, Tuolumne county, this State, elected to place therein a Challenge and a Loftus feeder to be operated side by side, under equivalent conditions of use.

The mill being made ready for operation, the superintendent, a perfectly disinterested person, acting in the interest of the company which he represented, being desirous of determining which was the best form of feeder, undertook a competitive trial between the two, which was conducted in a full, strictly fair and impartial manner, and the superiority of the Challenge was so unequivocally demonstrated, and the Loftus found to be so incapable of fulfilling its intended purpose, that he gave a peremptory order to the Joshua Hendy Machine Works of this city, the manufacturers, for the immediate shipment to him of a Challenge feeder to replace the Loftus.

Comment upon the above relation of facts is deemed unnecessary, for "a word to the wise is sufficient," and intelligent mining and millmen may appreciate the statement thus placed before them in further substantiation of the long-recognized superiority of the Challenge feeders.

N.

## Mining Share Market.

The only advance of any note among stocks the last week was that of Ophir, followed by Mexican, and no special cause was assigned for that. Still what movement there is seems to be upward, and purchasing orders from the Comstock are getting heavier. The Virginia Enterprise says that the reports from the superintendents are encouraging. The Con. California and Virginia pan-mills have been shut down for a general cleanup. Careful comparisons will be made of the result of the pans operated under the Rae electrical process and the other pans. If the electrical business proves satisfactory the other half of the mill will be immediately rigged up with electric apparatus. Before the mill starts up again a brand new complement of wire ropes will be put in, and possibly a system of surface gearing will be put in to tighten the ropes.

The following companies have cash on hand according to the statements placed on file: Alpha, \$6306.40; Andes, \$6223.89; Alta, \$35,295.59; Bullion, \$28,873.47; Belcher, \$12,286.58; Belle Isle, \$30,080.74; Bodie, \$32,190.80; Bulwer, \$7319.87; Caledonia, \$2235.34; Challenge, \$14,950.98; Chollar, \$16,117.03; Con. California and Virginia, \$83,303.56; and \$83,539.38 in unsold bullion, with further shipments to arrive; Con. Imperial, \$9562.68; Confidence, \$3741.17; Crocker, \$1649.50; Dundley, \$767.16; Eureka, \$58,979; Exchequer, \$5299.01; Foundry, \$360.68; Gould and Curry, \$14,903.38; Holmes, \$35.79; Independence, \$5595.15; Julia, \$1070.04; Justice, \$9785.46; Lady Washington, \$9797.36; Mono, \$28,143.64; Mexican, \$1044.13; North Belle Isle, \$104,136.84, in cash and unsold bullion, amounting to \$43,560.86, with further shipments to arrive; Ophir, \$12,807.69; Occidental, \$8376.66; Orleans, \$1070.04; Overman, \$39,660.36; Peer, \$2534.54; Peerless, \$15,355.77; Ponders, \$339.29; Scorpion, \$5540.05; Standard, \$84,900.34; Syndicate, \$10,435.89; Sierra Nevada, \$14,165.49; Union, \$42,192.23; Utah, \$16,650.11; Weldon, \$5819.73.

The following companies have an indebtedness: Best and Belcher, \$8618.41; Commonwealth, \$33,454.69; Crown Point, \$30,825.03; Grand Prize, \$47,013.89; Hale and Norcross, \$5287.07; Locomotive, \$3686.01; Mt. Cory, \$12,977.15; Nevada Queen, \$7903.22; Navajo, \$25,210.24; Potosi, \$14,163.72; Seg. Belcher, \$12,376.53; Savage, \$32,292.51.

## Don't Fail to Write,

Should this paper be received by any subscriber who does not want it, or beyond the time he intends to pay for it, let him not fail to write us direct to stop it. A postal card (costing one cent only) will suffice. We will not knowingly send the paper to anyone who does not wish it, but if it is continued, through the failure of the subscriber to notify us to discontinue it, or some irresponsible party requested to stop it, we shall positively demand payment for the time it is sent. LOOK CAREFULLY AT THE LABEL ON YOUR PAPER.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING JANUARY 31, 1888.

377,352.—HAND-CAR—Deodatus Chapel, S. F.  
377,067.—HARVESTER—J. B. Gemmill, Red Bluff, Cal.

377,115.—TESTING THE FAIRNESS OF ENGINE CRANK SHAFTS—John Paterson, S. F.

377,272.—AMALGAMATOR—N. L. Raber, Corvallis, Ogn.

377,274.—TRACTION ENGINE—D. L. F. Remington, Woodburn, Ogn.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Mount Diablo, Feb. 4, \$10,631; Grand Prize, 4, \$26,000; Hale and Norcross, 4, \$32,000; Moulton, 4, \$19,648; Silver Bow, 4, \$18,080; Lexington, 4, \$32,064; Pollock, 4, \$7568; Moulton, 6, \$17,584; Eureka Con, 4, \$21,972—total for January, \$43,564; Hanauer, 4, \$1950; Germania, 4, \$1537; Hanauer, 5, \$2000; Crescent, 5, \$3550. There were shipped from Salt Lake City during the week ending with Saturday, February 4th, 22 cars bullion, aggregating 752,818 pounds; 40 cars silver and lead ore, 1,177,000 pounds; 1 car copper ore, 29,000, and 1 car matte, 28,000 pounds, making a total of 64 cars, amounting to 1,989,818 pounds.

MINING ENGINEERS.—The American Institute of Mining Engineers will hold its 13th annual meeting at Boston, Mass., beginning Tuesday, Feb. 21, 1888. A number of visits will be made to local industrial establishments, and the annual election will occur. A number of interesting papers will be read, among them the following: "Formation of Fissure Veins," by S. F. Emmons; "Theory of Jigging," J. C. Bayles; "Topography and Geology of the Cerro de Pasco, Peru," A. D. Hodges, Jr.; "Russell Process in its Practical Application and Economical Results," Ellsworth Daggett; "Improved System of Water Supply for Hydraulic Mining," H. D. Pearsall; "System of Mining in Large Bodies of Soft Ore," R. P. Rothwell.

MINING BUREAU CONTRIBUTIONS.—Among the recent contributions to the collection of the California State Mining Bureau are the following: Large specimen anthracite coal, Colorado, E. E. Chever; fine specimen calcantite from the Bluestone mine, Walker River, Nevada, Jno. D. Ludwig; lignite of good quality, Alaska, E. Boggs; rich silver ore, Ruby Hill, White Pine district, Nevada, C. H. Allen; gold quartz, Golden Gate mine, New River district, Trinity Co., Cal., R. Gibson; diatomaceous earth, Eureka, H. B. C. Bachelder; silver ore (with gold), Wagontown, Idaho, A. E. Walton; silver ore (sphenoid of silver in kaolin), Idaho, M. Attwood; mirabilite, San Bernardino Co., J. H. Plant; opal, Melville Attwood.

## OUR AGENTS.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favors. We intend to send none but worthy men.

F. B. LOAN—Santa Clara Co.  
JOHN G. H. LAMPARELLI—San Benito Co.  
G. W. INGLETS—Arizona Territory.  
WM. WILKINSON—San Joaquin and Stanislaus Co's.  
A. F. JEWETT—Tulare Co.  
E. H. SCHAEFFER—El Dorado and Adair Co's.  
C. E. WILLIAMS—Yuba and Sutter Co's.  
K. G. HUSTON—Montana Territory.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

## A NEW AMERICAN BOOK—ON—Minerals, Mines and Mining. JUST READY.

A Practical Manual of Minerals, Mines and Mining. Contains suggestions as to the localities and associations of all the useful minerals, full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D., author of "The Metallurgy of Iron and Steel." Illustrated by 171 engravings. In one volume, 8vo, 367 pages. Price \$4.50, by mail, free of postage, to any address in the world.

CONTENTS.—PART I. MINING MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Mining Mineralogy, Preliminary Principles and Preparations, Economic Treatment and History of the Useful Minerals, Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Corundum, and Emery, Pumice Stone, Infusorial Earth, Grindstones, Buhne, the Diamond.

PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SUBORDINATE, WITH DESCRIPTION OF A SOCIETY OF APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 99 pages, illustrated by 165 engravings, with details too full to be comprised within the limits of this advertisement.]

Appendix. Sinking Artesian Wells, Oil and Gas Wells, Index.

An illustrated circular, 4 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage to any one in any part of the world who will apply by letter.

The above or any of our Books sent by mail free of postage, at the publication price, to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 16 pages, 8vo, and our other Catalogues and Circulars, the whole covering all of the branches of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO., Industrial Publishers, Booksellers and Importers, 810 Walnut St., Philadelphia, Pa., U. S. A.

## HEADLINE BUSINESS COLLEGE, 24 POST ST., S. F.

FOR SEVENTY-FIVE DOLLARS THIS

### Books on Assaying.

By C. H. AARON.

#### PART I.—Gold and Silver Ores.—Price \$1.

This new work is written by an experienced metallurgist who has devoted many years to assaying and working precious ores on the Pacific side of the American Continent. He writes thereof he knows from personal practice, and in such plain and comprehensive terms that neither the scientist nor the practical miner can mistake his meaning. The work, like Mr. Aaron's former publications ("Testing and Working Silver Ores," "Leaching Gold and Silver Ores") that have been "successfully popular" is written in a condensed form, which renders his information more readily available than that of more wordy and less conscientious writers. The want of such a work has long been felt. It will be very desirable in the hands of many.

#### Table of Contents:

Preface; Introduction; Implements; Assay Balance; Materials; The Assay Office; Preparation of the Ore; Weighing the Charge; Mixing and Charging; Assay Litharge; Systems of the Crucible Assay; Preliminary Assay; Dressing the Crucible Assay; Examples of Dressing; The Melting in Crucibles; Scorching; Cupellation; Weighing the Lead; Parting; Calculating the Assay; Assay of Ore Containing Coarse Metal; Assay of Roasted Ore for Solubility; To Assay a Cupel; Assay by Amalgamation; To Find the Value of a Specimen; Tests for Ores; A Few Special Minerals; Solubility of Metals; Substitutes and Expedients; Assay Tables. The volume embraces 106 12mo. pages, with illustrations, well bound in cloth; 1884. Price, \$1, postpaid. Sold by DEWEY & Co., Publishers, No. 252 Market Street, San Francisco.

#### PARTS II AND III.

Lead, Copper, Tin, Mercury, etc.  
Price \$1.75.

This book is entitled "Assaying—Parts II and III," and is separate from Part I, and treats of Gold and Silver Bullion, Lead, Copper, Tin, Mercury, Zinc, Nickel, Cobalt, etc.

#### Table of Contents:

Gold and Silver Bullion; Apparatus; Melting Bullion; Assaying Bullion; Humid Assay of Silver; Manipulation, etc.; Lead Ores; Copper Ores; Volumetric Assays; Parkes' Process; Amalgamation; New Process; Preparation of Potassium Zanthate; Electrolytic Determination of Copper in Ores, etc.; Assaying of Tin Ores; Assaying of Mercury Ores; Assaying of Zinc Ores; Assaying of Zinc Ores, New Method; New Assay of Nickel and Cobalt; Assay of Chromium; Assay of Bismuth; Assay of Arsenic; Assay of Antimony; Assay of Sulphur; Assay of Salt; Appendix to Part I; Notes on Crucible Assays; Weighing by Oscillations; Appendix to Part III; The Assay of Lead; The Assay of Copper. There are 160 12mo. pages with illustrations in the volume which is bound strongly in cloth. Price postpaid, \$1.75. Sold by DEWEY & Co., Publishers, No. 252 Market St., S. F.

### Dewey & Co.'s Scientific Patent Agency.

OUR U. S. AND FOREIGN PATENT AGENCY presents many and important advantages as a Home Agency over all others, by reason of long establishment, great experience, thorough system, intimate acquaintance with the subjects of inventions in our own community, and our most extensive law and reference library, containing official American and foreign reports files of scientific and mechanical publications, etc. All worthy inventions patented through our Agency will have the benefit of an illustration or a description in the MINING AND SCIENTIFIC PRESS. We transact every branch of Patent business, and obtain Patents in all countries which grant protection to inventors. The large majority of U. S. and Foreign Patents issued to inventors on the Pacific Coast have been obtained through our Agency. We can give the best and most reliable advice as to the patentability of new inventions. Our prices are as low as any first-class agencies in the Eastern States, while our advantages for Pacific Coast inventors are far superior. Advice and Circulars free.

DEWEY & CO., Patent Agents.

—MANUFACTURERS OF—

### NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

### Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES,  
HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

### THE ROLLER ORE FEEDER

[Patented May 28, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works,  
Sole Manufacturers,  
227 First Street, San Francisco, Cal.

THE H. H. H. Horse Liniment puts new life into the Aching Horse! For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windgalls, Sore Shoulders etc. and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

HORACE D. RANLETT,  
Ores, Mining, and Commission,  
420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co.  
NEWTON COPPER MINE, Amador Co.  
Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

QUARTZ MINES FOR SALE.  
Under good bonds, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

### WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families  
HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day  
And upward.

ROOMS WITH OR WITHOUT BOARD.  
FREE COACH TO THE HOUSE.  
J. POOLEY.

### ELECTRIC DEVELOPMENT COMPANY.

### Incandescent & Arc Electric Lights.

Electric Motors, Dynamos, Trams, Elevators, Signals and all kinds of Electrical Systems for Lighting and transmission of power, either direct or with storage Batteries.

For Mines, Hoisting Works, Mills, Reduction Works,

Indoor and Outdoor Illumination of every kind. Gas, Oil and Candles superseded by the

EDISON INCANDESCENT LIGHT,

The only complete and satisfactory incandescent system. Lights require no attention, and are under complete control. Over 500,000 lights in use in the United States. SELF-REGULATING ARC LIGHTS turn night into day and afford a means of working the whole 24 hours; invaluable to contractors and others to whom time is an object. Estimates and designs on application.

Offices and Showrooms, 323 PINE ST., SAN FRANCISCO.

### JOSHUA HENDY MACHINE WORKS,

Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal.  
D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,  
And will furnish descriptive Catalogues and quote prices upon application.

### DEWEY ENGRAVING COMPANY,

## ATTENTION, GOLD MINERS!

WE ARE SELLING

### Silver-Plated Amalgamating Plates

For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of JOHN TAYLOR & CO., cor. First and Mission Sts.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS.**

E. G. DENNISTON, Proprietor. 653 & 655 Mission St., San Francisco, Cal.

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the Silver-plating, and in having much less Silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. SEND FOR CIRCULAR.

This cut represents our  
**IMPROVED  
HYDRAULIC  
MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

HOSKIN & CO., Marysville, Cal.

### IMPROVED FORM OF HYDRAULIC GIANTS.

The above cut illustrates the IMPROVED FORM OF DOUBLE-JOINTED HYDRAULIC GIANTS, with lever attachment, which we manufacture. All similar styles are infringements upon this form, and a judgment stands of record to that effect, under a decision of Sawyer, Judge of the U. S. Circuit Court, in the case of Hendy and Fisher vs. R. Hoskin et al.

We also manufacture the "Single-Jointed Giants."

Prices and Catalogues of Hydraulic Mining Machinery furnished upon application.

**JOSHUA HENDY MACHINE WORKS,**

# \$1,000 CHALLENGE ACCEPTED,

**PRICE, FIVE HUNDRED AND FIFTY DOLLARS  
(\$550.00).**

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

VOLUME LV  
Number 7.

## Testing Fairness of Crank Shafts.

John Paterson of Victoria, B. C., has recently patented, through the MINING AND SCIENTIFIC PRESS Patent Agency, an instrument to be used upon steam engines to gauge or test their several parts in their operation. It places in the hands of engineers, engine-builders and others a correct and speedy method of testing and adjusting the crank shafts. The engravings given herewith show the application of the device. Fig. 1 is a plan of the instrument showing it in position. Fig. 2 is a cross section through the sliding head *H* and connected parts.

*A* is the piston rod of the engine, *B* is the connecting rod, *C* is the crank shaft, *D* is the crank and *E* is the crank pin.

*F* is a frame, preferably of brass, and connected at *f* with the working part of the piston rod *A*. *G* is a rod, bar or tube (preferably the latter for the sake of lightness), which is fitted in the other end of the frame *F*, in sockets therein, so that it may be adjusted lengthwise, it being fixed in the position to which it is adjusted by the set screws *g*. The rod *G* lies in the same horizontal plane as the piston rod and extends a few inches beyond the center of the crank shaft, forming practically a perfectly parallel extension of the piston rod *A*. On the end of rod *G* next the shaft is carried the sliding adjustable head *H*, adapted to be set in position by a screw *h*, and fitted on the top side with a small level *I*. In the end of head *H*, and next to the shaft, is fitted and adapted to rotate the hub *j*, in which is fitted the radial arm or tube *J*, which is adjustable lengthwise and is set by a screw *j*. The outer end of this arm carries a sliding head *K*, adapted to be set by a screw *k*, and having fitted to it adjustably a pointer *L* set by a screw *l*. A pointer *M* is fitted in the end of the hub *j*, of arm *J*, and is adapted to move endways therein, said named pointer being for the purpose of setting the instrument in order that the pointer *L* may revolve concentric with the path of the crank pin.

If the outside of the crank pin is flat, or has been bruised, it will be necessary to drill a small hole in the center and put in a pin, represented by *e*, allowing it to project about one-eighth of an inch.

To use the instrument, first disconnect the connecting rod from the crank pin, leaving the cross head about one inch from its extreme outward travel. After setting the head *H* perfectly level, by the means of the level in its top, center the pointer *M* on the crank shaft *C*, then turn the crank shaft around and adjust the pointer *L* to the center of its crank pin, then gauge said pin at the outward and inward centers of the crank thereon, by the pointer *L*. It will thus be readily perceived whether the shaft is rectangular with the line of the cylinder, then turn the crank pin to the top and then to the bottom, following with the pointer *L*, which will show at once whether the shaft is level or not.

The application of this instrument will show the slightest variation of the shaft from the rectangular path of the piston's travel, and at the same time point out the slightest variation

of the shaft from a true level. This it will accomplish in a few minutes, without the labor and great loss of time required to take out the piston, center the cylinder, apply a line and

WIRE ROPE CONVEYOR.

level, as is usually done, involving a heavy loss, as, for example, in the case of large engines used in driving the machinery of factories and mines.

The advantages resulting from the use of this instrument are the absence of hot bearings, saving of brasses and oil, increase of power as

been no less so to the mining interests of California. The heavy storms that prevailed in the month of January, consisting of rain at lower altitudes, left a deep deposit of snow on the northern Coast Range and on the Sierra Nevada mountains. This snow, becoming impacted, laid a good foundation for more to fol-

Fig. 1.

INSTRUMENT FOR TESTING FAIRNESS OF STEAM ENGINE CRANK-SHAFT.

well as reducing to a minimum the risk of breaking shafts and crank-pins with the accompanying wreckage resulting therefrom. In situations where a number of steam engines are under one ownership or control, only one instrument will be required. Being made for the largest engine, it is only necessary to have bushings bored, and in halves to fit the various sizes of piston rods, and turned outside to fit the frame; while any convenient length of tube may be used as well as a number of pointers of various lengths. In order to test the instrument at any time it is only necessary to turn the radial arm around against a plumb line to test the level, and against the largest tube to test the other two points.

SENATOR STEWART'S bill to amend the mining laws has been favorably reported.

## Mining Operations Active.

The weather which thus far the present year has proved so propitious to the agricultural has

good wages, where, if they had to buy water, this would be impracticable. It is possible now to wash in the dry diggings and practice ground-sliding, neither of which can be done to any great extent in the dry winters. Since the advent of the warm weather the hydraulic miners have got to work, the snow and ice having so obstructed the ditches in the early part of the season that they could do but little even in the most favored localities. Everything considered, the mining outlook, not only in California but throughout the entire coast, is exceedingly good, an unusually prosperous year awaiting, without any doubt, those engaged in this industry.

## Garland's Cable Conveyors.

Garland's patent system of cable-power transmission and conveyors is used for log haul-up works, pumping mines and deep wells, grain elevators, and for conveying coal, iron, etc. We give on this page a cut of the wire-rope conveyor. The form of the sprocket-wheels is the same as in ordinary cable-wheels except at the gaps or cut-outs to receive the clamps and complers.

At *D* in Figs. 2 and 3 the tooth in the cable-wheel is shown with a cut-out, so that soft and fine substances will be forced out between the flanges of the sprocket-teeth. Fig. 2 shows the construction for clear sawdust and fine coal.

Dust, etc., may be carried with the lower cable when comparatively clear from sticks, shunks, etc., as shown in Fig. 2, but when harks, offal, and such like are to be carried it is best to convey with the upper cable as shown

in Fig. 1, only it should be carried over as shown in Fig. 2, and the upper section cut away so that it will make the discharge at *E*, on each side of the cable, and over, and at each side of the lower cable *C*, down as shown at *A*2.

The sides of the carrier are set at an angle of 45 degrees, and a strip of hand iron is fastened to the carrier sides in a cross-horizontal position under the cable, so that the clamps *B* rest upon it and do not wedge in between the sides *AA*.

The wheels *D* are 24-inch diameter, for one-half-inch cable, and 30-inch diameter for five-eighths and three-fourths inch cable. Clamps four-inch diameter are used on one-half-inch cable; five-inch diameter on five-eighths-inch cable, and five or six inch on three-fourths-inch cable.

One great advantage in this system is, that the cable can be spliced with one of the patent clamp couplings at any point, and the coupling forms one of the clamp conveyors, and runs on the wheel in the same space. H. P. Gregory & Co. are Pacific Coast agents for this device.

THE Carson Tribune says: The new ore discovered near Carson is the general topic of conversation, and the greatest confidence is felt as to its future.

THE Pittsburg gold mines, Lander Co., Nev. are shipping over \$9000 in gold bullion every week, which is the product of two Huntington mills.

Fig. 2.

## CORRESPONDENCE.

We admit, unadvised, opinions of correspondents.—E.D.S.

## Mexican Mines.

EDITORS PRESS:—In former letters you were informed of some mines and mining enterprises in Sonora which are in possession of English companies; this time the history of a mine is submitted, which property seems not to be inferior to the most profitable ones in this State, and which may be yet had for the asking of it, providing the asking is backed by a substantial check or warrant of some acceptable sort. The mine, or a part of it, being in the market, has for some reasons to be called by a fictitious name, and thus Santa Victoria will do just as well as any canonized saint. The following lines are mostly extracts from a report of a mining engineer.

About 25 miles east from the Sonora railroad, over a road which can be made passable for teams at a probable expense of \$3000, is situated the Santa Victoria mine, or mines, as there are several ledges embraced in the claim. The mountain chain, which is an out-runner of the Sierra Madre, consists of a dark syenite, occasionally traversed and overlaid by dykes and large masses of limestone. The country affords many varieties of timber necessary for mining purposes and an ample supply of excellent firewood. Flowing water for milling purposes can be had two miles above the mine and brought down to the mine by ditch or pipes.

The Santa Victoria mine was discovered in 1817 and worked by Spaniards. Subsequent revolutions brought the mine into Mexican hands, not as skilled in the art of mining nor possessed of the same resources as their predecessors, and also more profligate, reckless and careless concerning the working of the mine and minerals, as well as of spending the silver taken from it. As usual in such cases, the silver ore was extracted wherever found, without the least consideration of the security of the works nor of future opening and working. In such a shipshod manner the mine was worked by its owner for half a century, supporting him and his large family and dependents, the working being occasionally interrupted or accelerated by the Apaches, who formerly favored this part of the country with their visits, as numerous graves and crosses by the roadside will testify.

The mine proper consists of three ledges. No 1 is the discovery ledge or *veta de la posicion*. A small tunnel was run in at an elevation of about 250 feet above the arroyo; the ledge shows six feet wide with fair assays of silver throughout the whole width, but owing to the discovery of much richer ore in an adjoining ledge, and to the fact that this ledge seems to originate from some larger deposit of a greater depth, it was abandoned for ledge No. 2, 65 feet east of the discovery tunnel. A tunnel was run into this ledge, showing it to have a course of south 35° east, a thickness of five feet between walls and a dip of 56° to the north. This ledge has been worked from the surface down by tunnels and by shafts to a probable depth of 200 feet, and large quantities of pay ore were taken out by the old and rude ways of notched timbers, on which the men climbed up like monkeys with a load of ore in a rawhide basket on their backs. As before mentioned, the works were carried on with but little consideration for the safety of the mine; it is therefore unsafe to examine them closely. From the walls small amounts of rich ore, consisting of ruby silver which were left hanging, were taken out, and testified to the value and character of the ores extracted.

The main tunnel into this ledge is 120 feet long, cutting the ledge evidently in ore as shown by large vacant chambers, assays of remnants yielding up to 600 ounces silver per ton, and is connected with the workings above. Within this tunnel, near the end of it, a shaft was sunk about 80 feet deep, and by means of a small crosscut a stringer of the ledge was out at that depth, which shows 18 inches of ore assaying \$229 in silver and \$27.80 in gold, of a character which bids fair to be permanent, and rivals the silver glance of Tocucitita.

But the work on this part of the ledge had to be discontinued on account of lack of ventilation. The stringer of ore has a course parallel to the ledge, showing by its dip and by the absence of defined walls that it is a mere stringer and its tendency to join the main ledge at a depth of about 50 feet.

Ledge No. 3 is the strongest ledge of the system and somewhat opened by short shafts and drifts, which are distant about 200 feet east of the main tunnel. Its width increases rapidly from 2½ feet to 6 feet at a depth of 20 feet. This ledge has been gouged out, from the top of the mountain down, with the same lack of system and care. Wherever the workings became "effluated," or where rebellious ores were struck, they were abandoned and another place worked, by which chloride ores could be extracted. A similar case was the mines in Catorce and Zicatene, where, after passing ore bodies easy to be benefited by the simplest amalgamation, a transition was encountered in which antimonial and arsenical sulphide ores appeared which did not yield as readily its precious metal, when many a promising mine, which now commands millions, was abandoned and left to its fate.

By the course and relative dip of the three just mentioned ledges, it is evident that there

is a strong probability of their joining. A 100-foot shaft, with its proper drifts, would and will prove the presence of virgin ore bodies. It is now merely a question of *quien sabe* who will prove this to be a fact; or possibly it is only a question of time. The present holders are the Mexicans who formerly worked the mine a part of the time, and who are, of course, unable to do more than hold the mine.

THEO. G. ED WOLLER.

Hermosillo, Mexico.

## Sparta Mines, Oregon.

EDITORS PRESS:—In collecting statistics for publication in the review of last year's business, some delay was occasioned by owners of the principal placers leaving before such information could be obtained, and which necessitated considerable correspondence before the facts now embodied in this report could be secured. The gold-bearing quartz mines are attracting considerable attention, and it is hoped the next season will see mills constructed for the proper reduction of our ores, and forever put to rest the imperfect arastras which are now the only means of getting the values out of the mines. The amount of ore treated in the six different arastras aggregates in round numbers 1137 tons, showing a cleanup of \$24,331.80, or \$21.40 to the ton. The sulphurets, which contain the greatest value, are entirely lost, and not over 65 per cent of the free gold saved. During the past season the coarsest gold has been found in Betsey Gulch, many of the nuggets weighing an ounce or more and of superior quality.

Shanghai, Rattlesnake, Tackle, Sawmill, Blue, Red, Maiden, Town, Skillet, Cow, Bear, Lovers, Hungry, Gem, and Bolivar, are the principal gulches worked. The output from the old channel of Eagle creek has averaged \$7.40 to the hand, and the bars on Eagle creek proper have paid handsome returns to the miners. Considerable ground has been worked on Lower Powder river, but owing to imperfect facilities for handling the water, only moderate wages has been made. Nearly one-half of the placer mines are owned and worked by Chinese, which makes it difficult to secure correct returns, as they only sell enough of their gold to pay expenses and ship the balance to China.

From the best information obtainable, and computing that two-fifths of the gold washed was by Chinamen, not less than \$325,000 was taken from the above-named gulches, making the output from Shanghai gulch alone, since its discovery, \$1,800,000.

The capacity of the Sparta canal, which is 32 miles in length, will be increased several hundred inches, and the water raised 125 feet higher, carrying it over the Powder river divide, which will furnish to hundreds of miners rich placer ground for the next quarter of a century. With proper facilities for treating the inexhaustible supply of gold ores, and miners enough to work the available placer grounds, the output of gold for the year 1888 will exceed \$2,000,000.

SILAX.

## Treatment of Cobalt and Nickel Ore in a Converter.

[Written for the Press.]

A great change has taken place in the last three years in the treatment of cobalt and nickel ore. Old processes are done away with. New and improved ones have taken their place, but none of the metallurgical discoveries in this branch of business has been more successful and more pregnant with benefit to the manufacturers than the employment of converters.

The first reduction works which adopted this process and employed it with great success for the poorer class of ore, was the German Reduction Works, for cobalt and nickel.

The ore worked is mostly from Norway and Sweden. They are periferous iron, containing only 2 to 4 per cent of cobalt and nickel; they are shipped as mined to the reduction works in Germany. Here they are melted in three cupola furnaces or a blast furnace, which is 5 m. high and 1 m. diameter. They have three tuyeres of 7 c. m. diameter, and 80 c. m. above the furnace bottom. The slag is running continually from the furnace through a slag hole 60 c. m. above the bottom, especially designed for this purpose. Every three hours the matte is tapped from the furnace. The fuel is coke and the blast has a pressure of 20 c. m. water. The charge consists of 140 pounds burned lime, 1000 pounds ore, 100 pounds limestone, and slag from the converter.

The capacity of the furnace in 24 hours is 20 tons of ore, 1½ tons slag, 2 tons of matte of about 30 per cent cobalt and nickel. The run of the furnace is two to three months. After the ore is thus melted and concentrated, the matte is immediately discharged from the furnace into the converter.

The converter is a vertical cylinder, lined with refractory material, having inclined tuyeres at the sides, and is otherwise very similar to those used for the production of steel.

The matte of 30 per cent is here in the converter concentrated from 75 to 77 per cent, cobalt and nickel matte, which is now ready for the wet process.

The process in the converter commences at once when the blast is put on. The flame is in the beginning short and yellow. The flame gets whiter and great clouds of fume issue after two

to three minutes. Sulphur and arsenic escape and the whole contents begin to boil violently. With the oxidation of the iron in the last stage of the process, the fume disappears and the flame gets lighter and lighter. In from 20 to 25 minutes the process is finished. The whole mass is discharged into an iron mold, where a separation, according to the specific weight, takes place. The slag gathers on the top, the matte below. This matte contains now from 75 to 77 per cent of cobalt and nickel, the slag 1 to 2 per cent. The latter is easily dressed from the matte, and is afterward added again to the ore into the cupola furnaces.

This cheap, simple and beautiful process is claimed to be the invention of the French metallurgist Magnis and his engineer David, but tests to this and similar effects of the converter for the purpose of refining copper and nickel were made by the Prussian mining engineer Teminskow, in the year 1870.

WERNER LANGCOUTH.

## Elkhorn, Montana.

EDITORS PRESS:—The Elkhorn Mining Co. are again operating their mill after a shutdown of six months, required to pump the flood of water out of the mine. Advantage was taken of the shutdown to thoroughly overhaul the mill and erect a machine-shop fully equipped with lathes, planers, drills, etc., so that they can do their own repair and other work. A new Howell-White roaster was added to the mill and more pan capacity. They are now producing a 1600-ounce bar of silver bullion every 24 hours. A system of washing and hand sorting the ore has been introduced by the new superintendent, Mr. Pender, and tribute working of the mine.

The J. R. Keene Co. are employing about 12 men opening up their mine. No ore is being stopped, but they have taken out quite a large amount during development work.

The Relief Co. struck quite a large body of high grade silver ore on their 100-foot level. They are to increase their capital stock and a mill is talked of.

The Union Mining Co. are working steadily with a small force. They shipped a car of 100-ounce ore and have another carload of 250-ounce ore ready for shipment, and a large lot of lower grade ore on the dump.

The Paymaster has let a contract for a 100-foot shaft, and the Shober for a 100 foot tunnel. Both of these mines have shipping ore. The Keystone Co. are driving a tunnel to their vein, having so much water in the shaft that they cannot work it. They also have shipping ore on the dump. The Elkhorn Queen have contracted to run a drift 100 feet long on the 200 foot level to ascertain the extent of the ore shoot. The body is from 30 to 40 feet wide at the station. They shipped one lot of high-grade lead ore to the C. and D. smelter containing about 100 ounces of silver.

The C. and D. are doing only prospect work. They have about 2000 tons of \$40 ore on the dump and have shipped 1000 tons to their smelter, about 800 tons of which has been smelted. They have a large body of the same kind of ore variously estimated at from 40,000 to 50,000 tons. They shipped four carloads of lead bullion carrying from 8 to 12 ounces gold and from 120 to 170 ounces of silver. Owing to the high price and difficulty of getting coke, and not being prepared, they have shut down until spring. The Sophia has some very high-grade ore, but is not doing much. The camp looks better than at any period of its history, but needs a railroad, as there are large quantities of ore that pay little or no profit with high wagon freights. The Louise have struck a body of high-grade ore on their 100-foot level. It carries over 200 ounces of silver and a half-ounce in gold. They have some curious mineral in their mine, carrying iron, manganese, arsenic, antimony, lead, copper, silver, gold, and cobalt and nickel.

Elkhorn, Montana Jan., 1888.

## Indiana Silver Mines.

EDITORS PRESS:—The last silver bullion shipment from the Dubois Co., Indiana silver mines, has created a favorable impression, and a great number of people gathered to witness the 20-ton capacity smelter pouring out its 1500 pounds of concentrated silver bullion daily.

Since the last three weeks of blowing in this smelter the water-jacket has run to our perfect satisfaction. Some 300 tons of ore now at our smelting works averages, according to the U. S. mint assay reports, 58 ounces in silver and 4.10 ounces in gold per ton.

A good vein of coking coal was found within 50 yards of our smelting works; also plenty of lime-rock and iron ore. There is also galena for fluxing, so that the mining and smelting expenses here do not exceed \$4 per gross ton. More smelters will be erected early this spring. This is our fifth year of operation, and nothing has been said to the outside world to cause the foolish booming so detrimental to a new mining camp.

THE BUCK SHOALS MINING &amp; SMELTING CO.

NATURAL GAS.—Horace D. Dunn has addressed a communication to the directors of the Mechanics' Institute, suggesting that a meeting be called by them of manufacturers who use fuel for manufacturing purposes, with a view of ascertaining whether natural gas wells exist in the vicinity of this city, and how experimental wells may be sunk.

## Mill Tailings.

Perhaps some of our readers may be able to answer satisfactorily the question propounded in the following letter:

EDITORS PRESS:—My partners and myself have on hand over 1000 tons of mill tailings, accumulated from the crushing of gold-bearing quartz by a 10-stamp-mill several years ago. The tailings contain quite a large percentage of iron pyrites, or sulphurets, some free gold, a little amalgam, and some quicksilver, and lie on the side of a creek which in the spring has plenty of water for sluicing, for three or four months, and by that method, using rills and blankets, we can save only a portion of the sulphurets.

The creek does not afford water enough to justify erection of water-power machinery, and the tailings are not rich enough, or in quantity sufficient to justify putting up steam-power to run concentrators. If any of the readers of the Press can, through your columns, give us any information concerning a cheap method of working such tailings, which is an improvement on the sluicing process, they will oblige

Slater Creek, Arizona. S. A. SMITH &amp; Co.

PROTECTING WATER DITCHES.—It has been suggested by Grass Valley parties that a continuous and ample supply of water for the mines there can be insured during the winter months if the South Yuba Canal Company will adopt the plan of covering their ditches with poles and brush so as to prevent the snow from getting into them. A talk about the matter was had yesterday with Superintendent Brown. He says the covering plan is not practical for many reasons. The main ditch is where the worst troubles originate as a rule. Although it is eight feet wide and carries a large body of water, a low temperature causes the formation of anchor ice which commences growing from both sides and the stream becomes a solid mass of ice in an incredibly short space of time. Then much annoyance is frequently occasioned along the stretches of fluming, for if the water once commences overflowing during a "cold snap" it freezes on the outside of the boxes and as the mass of ice grows it extends into the flume with the result of effectually blocking it. A particularly bad place is the four-mile section of ditch from Quaker Hill down to Crystal Springs. Mr. Brown says the shutting down of the water supply is generally caused by the water freezing and not by snow. In his opinion any attempt at keeping up the flow by covering the ditches would be a senseless waste of time. If an accident should occur to the ditch the work of repairing it would be next to impossible were it covered, as the covering might all have to be removed in searching for the point where the trouble originated.—*Nevada Transcript*.

SMELTING WORKS WANTED.—The Esmeralda (Nev.) News says: The importance of suitable facilities for the economical reduction of ore in the several mining districts of this county was never more apparent. Under present circumstances our mine-workers are compelled to ship their ore to Selby's or some other works away from home that it may be worked and its product added to the many millions of dollars already produced by the mines of our county. There is then a question which should present itself to the capitalist and to the people here who are anxious for better times. If the Selby Smelting and Reduction Works, situated as it is in a county where no mining is being done and hundreds of miles distant from our mines, which have furnished it hundreds of tons of ore, can be successfully operated and to a great profit to its owners, then why may not such works be erected and thus operated in our county? There is every possible inducement here for those who can to erect such works here; water-power can be had, fuel obtained at a small cost, and ore in unbounded heaps awaiting to be reduced which cannot bear the expense of transportation. There is an abundance of ore; yes, sufficient to keep at least a dozen such as Selby's and the Reno works constantly engaged.

ALABAMA GOLD.—A correspondent of the *Chronicle*, writing from New York, says: I met Riette, the ex-San Francisco metallurgist, mine expert, chemist and engineer the other day on the "L." road, carpet-bag between his knees, and a big map in his grasp. He had just returned from a mining pilgrimage—a search for a gold mine—in no less a State than Alabama. Expressing some surprise at the existence of gold mines in that State, Riette assured me that they existed, but unfortunately the quantity was insufficient to make its mining a successful investment. Said Riette: "The rock will show about \$2 per ton, perhaps \$2.50, but it is so very light you can't save it. Reminds me of what Old Cash used to call it, 'Takes a pound to make an ounce, and the ounce is mighty hard to keep when you get it.' That's the trouble with the gold mines of Georgia, North Carolina and Virginia. You get nice colors in your pan, or horn, you get good assays, but when you come to work it the fine stuff generally gets away. There are some good mines down there. I ran through 100 tons last year for a Georgia company and got a bar worth \$960, but the gold was coarse and easily saved. Where am I going to next? Oh, I don't know yet. I want to go down to South America. They've got some world-heaters down there, they tell me, and I want to see them."

## Labor and the Laborer in California.

## A Report to the State Board of Trade.

The California State Board of Trade recently appointed a committee, of which Hon. M. M. Estee is chairman, to prepare a report on labor and the conditions affecting the laborer in California. The following report was submitted at the meeting on Tuesday of this week:

We know of no place where the man who seeks employment can do better than in California. The success of men who toil depends largely on the three questions of, first, steady employment; second, good wages; third, cheap living.

Steady employment is all-important. The opportunities that laborers have in California to get work and the facilities for doing the work they have make this the best place for the bread-winner to live in. In this State and in almost every field of industry where skilled or unskilled labor is employed, the worker gets a fair reward; for the labor market of California has never yet been fully supplied. Owing to the salubrity of the climate a man can work more days in the year and accomplish more in a given number of days than in any other place, for the heat is never oppressive and the cold is never severe.

And if he can work here more days than elsewhere, he necessarily receives more wages, because the employer can afford to purchase labor the year around if the work can be well done and seasonably done, in winter as well as in summer. There is nothing in the climate of California to prohibit even farm work from being done during all the winter months.

Then we submit that as steady employment is of the first importance to the man who must work even at the wages paid elsewhere, he can earn more and save more here.

The bricklayer in California can work at his trade at least ten months in the year; the plasterer can work every day in the year; cold weather never impedes or interferes with the exercise of his trade. The carpenters and builders construct houses in all of our cities and towns the year around, and although during the rainy season they may be obliged to stop work for a week at a time (if the building is not inclosed), yet, as a rule, building goes on in California from one year's end to the other without any permanent or marked intermission.

The farmer in California commences plowing the moment the rain falls, say in November, and plows and sows until his grain is all in, say in February. Then if he has a vineyard or an orchard, he commences to prune and cultivate, and continues to plow and cultivate them until about the time haying and harvesting begin, which is in May of each year. From that time on he harvests his grain until the last of October. Rain never injures his crop or stops his work.

It will thus be observed that the laborer who does any portion of his work outdoors has more time to do it in California than in any other part of the United States. That the farmer has more time to sow his grain and a longer time to securely harvest it than in any other place in the world. This is attributable to the fact that we have no severe winters or heavy frosts, and that the summer is rainless and warm with cool nights. To be exact, our winter is simply a rainstorm and our summer is rainless.

## Wages.

The wages of unskilled farm-hands in California is from \$20 to \$30 a month. The average wages is \$1 a day and board. This includes ten months of the year. The other two months of the year during the harvesting the same man gets from \$1.50 to \$2.50 a day and board.

Lumbermen and loggers receive from \$40 to \$90 a month and board, depending on what they do. Mechanics in every branch of skilled labor receive in California from \$3 to \$6 a day.

I have been informed by the officers in charge of the railroad work shops at Sacramento, where nearly 2000 men are employed, that the mechanics there receive from \$3 to \$5 a day, depending on the department they work in and their ability to do.

It is stated by the heads of the Educational Departments in this State that the average salaries paid female teachers throughout the State is from \$60 to \$85 per month. As a rule they board themselves. Girls as house-servants receive from \$20 to \$30 a month and board. Good teamsters are never paid less than from \$25 to \$40 a month. And the demand for all of the above classes of labor has never yet been fully met.

## Price of Labor East.

The most instructive lessons as to the advantages of our State over any other State of the Union, relative to the labor question, can be obtained by comparing the prices paid for labor in other States of the Union with the prices here, the amount of time in each year that the laborer here and there can work, the opportunities to get work in the two sections and the prices paid for living here and there.

In New York, Boston and Philadelphia, wages of skilled laborers in all the various trades practiced in these cities average from 10 to 35 per cent less than they do in California, and except only in large factories these skilled laborers cannot get work at their trades but a part of the year.

It was officially reported by the heads of some of the industrial societies in the East that carpenters did not average to work more than seven or eight months of the year; plasterers

not over six months of the year; bricklayers not to exceed six or seven months of the year, and it is a well-known fact that farm hands only get employment, as a rule, from six to eight months of the year.

We learn from official sources that in all the great Central and Northern States of the Union, farm laborers receive not to exceed from \$14 to \$20 a month for a term of six to eight months of the year. In the Southern States labor is not near so high. Female house-servants get from \$8 to \$12 a month in New York, Boston and Philadelphia, and female school-teachers throughout New England and the Central States of the Union receive only from \$16 to \$50 a month, and that for but a part of the year. Not one of the above list of toilers has continuous employment except the house-servants.

There is a large class of people working in factories in New England, New York and Pennsylvania, who mostly work by the piece, and who have continuous employment, but they labor for such small wages that continuous employment only serves to give them continuous bread.

## Cheap Living.

California is especially a food-producing country. The supply of all the breadstuffs, fruits, meats and fish far exceeds the demand. The result is that all the foods are cheaper in San Francisco by from 10 to 50 per cent than in any seaport town of the United States.

Good meats are cheaper in San Francisco, according to the published schedules of prices, than they are in New York by 30 per cent. Fruits are cheaper in San Francisco than anywhere in any of the large cities of the Eastern States by over 50 per cent. And so along the entire list of what man eats, California furnishes the necessities of life cheaper than any other State of the Union, excepting possibly Oregon.

To show the condition of the laboring classes of California, we refer to the report of the Bank Commissioners of this State, in which it appears there are on deposit in the banks of savings of California, sixty-two millions of dollars. The population of our State at this time does not exceed 1,150,000. The population of the whole Union has been estimated at 65,000,000 of people. By returns from the proper authorities it appears there are less than \$1,200,000,000 in all of the savings banks of our country. It will thus be seen that California has one-twentieth of all the money deposited in the savings banks in the country, and yet our population is only about one-fifty-sixth of the population of the whole nation. And although this is a new country, and isolated from the great populous and monetary centers of the world, yet our laboring people—those who make deposits in savings banks and who live by their toil—are better off by a vast percentage than any other like number of people in the United States or in the world.

Our products here are so varied, and the lines of labor so many, that the opportunities for every man and woman who wishes to toil to get remunerative employment surpass any other place within our knowledge.

In this connection, and to add to what has been already said, we may observe that as grain is sown at a different season in this State than in any other State in the Union, and that harvesting continues for a much longer period here than elsewhere, the interval between the sowing of the grain and the harvesting of it is so large that the intermediate time is filled up and more than filled up by the use of labor in the great and growing industry of horticulture and viticulture.

To repeat, our grain-fields are sown and cultivated in the winter months. Our orchards and vineyards are cultivated during the months of March, April and May. Our harvesting and haying are done chiefly during the months of June, July and August, while our vintage is carried on during the months of September and October.

Thus every hour may be well employed, and for these reasons. There is not a day in the year when there is not a demand for farm labor, and this demand is increasing most rapidly. The unquestioned salubrity of our climate and our freedom from malarial diseases gives to the laboring man a greater certainty and stronger probability of continued health and the physical ability to work than in any other place. Add the further fact that men of families require less fuel here to supply their homes and less clothing to secure warmth to their children, makes California the most attractive place on the face of the globe for a poor man to live in.

Our productions are so varied, the establishment of new industries is so rapidly increasing, that the chances for a poor man to establish a business for himself and his family are greater here than in most countries. For be it known that the public lands of this nation are nearly all occupied, so that now when one undertakes to make a home of his own, or build up a business for himself, he must do it outside of the generosity of the nation or the liberality of the land laws of the country.

The great ranches of California are now being divided up and sold in small parcels, and on long time and liberal terms, so that men of small means can find favorable investments for the little they now have, and for the accumulations they hope to have in the future. Small fruit farms pay in California because more fruit, and as a rule better fruit, is produced from the same amount of land here, and by a like amount of labor than anywhere else.

In conclusion we say: If a genial climate, a

fertile soil, sunny skies, a balmy, health-giving atmosphere, and scenery of unsurpassed beauty are useful and attractive to any man, they ought to be to the man who lives in their presence, he who toils.

M. M. ESTEE, Chairman.

## January Weather for Nine Years.

Sergeant J. A. Barwick, U. S. Signal Service Observer at Sacramento, has issued an interesting report on January weather since 1880 at the State Capital, which we quote as follows:

The average monthly mean temperature for January, 1888, was 42.8°. The normal or mean average for 34 years was 47.0°, showing this month to have been 4.2° colder than the average of many years—in fact, a monthly mean temperature of 42.8° for January has never occurred here before this month. The lowest mean before was 43° in January, 1854, which was the coldest month of that name, with the exception of this one, ever known here since records were kept. The lowest temperature recorded here in 1854 was 19° at 8 A. M., by Dr. Legan, although other thermometers indicated 17°. This month it was 19° by the Signal Service, 18.75° by Captain Foster, Eleventh and F streets, and 16° by S. H. Gerrish, at 1817 G street. Signal Service and Captain Foster's thermometers were Green's standard self-registering, and Mr. Gerrish's was Sike's self-registering thermometer. The average lowest then was 17.8°, or about 18°. There was snow on the 4th and 5th and 16th. Signal Service measurements were 1½ inches on the 4th, and 2½ inches (unmelted) on the 5th, and a trace on the 16th. Mr. Gerrish's measurements were: on the 4th, 2.89 inches; on the 5th, 3 inches, making a total of 5.89 inches, as against 4 inches by Signal Service measurement. A trace also on the 16th.

Snow has fallen before in January as follows, by S. H. Gerrish's records: January 29, 1862, 75 of an inch; January 12, 1868, 1.62 inches; Jan. 26, 1880, estimate about .25 of an inch—melted very nearly as fast as it fell. The rainfall and melted snow for this month, Signal Service records, was 4.81 inches. The average of many years is 3.78, showing this month to have been 1.03 inches in excess of the normal precipitation for January.

SUMMARY FOR JANUARY, 1888: Daily average temperature for the month, at 4 A. M., 38.8; at 12 M., 45.5; at 7 P. M., 44.1; monthly average, 42.8; highest and lowest temperature for the month, at 4 A. M., 54 and 21°; at 12 M., 60 and 30°; at 7 P. M., 57 and 31°; highest and lowest temperature for the month, 63° on the 25th and 19° on the 14th and 15th; average hourly velocity and prevailing direction of the wind for the month, at 4 A. M., was 4.8 miles, from the north and southeast; at 12 M., 7.5 miles, from the north; at 7 P. M., 5.4 miles, from the southeast; prevailing direction for the month was equally divided between the north and southeast. The average maximum velocity and direction of the wind for the month, at 4 A. M., was 9.5 miles, from the north and southeast; at 12 M., 11.8 miles, from the north; at 7 P. M., 11.5 miles, from the north. Highest velocity for the month was 36 miles from the north; extreme velocity, 38 miles. There were 11 killing frosts and snow fell four days—4th, 5th, 16th and 17th.

SEARGEANT J. A. BARWICK,  
Observer Signal Corps, Sacramento, Cal.

PRESIDENT AGASSIZ has decided to send 25 tons of concentrated ammonia down the burning shafts of the Calumet and Hecla mines at once, to put out the fire completely if possible.

## Academy of Sciences.

At the regular meeting of the California Academy of Sciences on Monday Feb. 6th, President Harkness occupied the chair. Gilbert Palache was proposed for resident membership. H. W. Turner of the United States Geological Survey presented the academy with six cases of insects, most of them mounted. Lucien M. Underwood also made a donation of the first and second decades of his *Hepatica Americana*. A magnificent collection of 1000 varieties of foreign and native flora was presented by Prof. R. A. Philippe of Santiago, Chili, who has been for some years an honorary member of the society.

A resolution was presented by Joseph D. Redding, expressing the desire of the academy that Mount Shasta and the vicinity as far as the McCloud river be reserved as a National California park. The resolution was unanimously passed.

Mrs. Currau and Drs. Behr and Hewston were appointed a committee to draft suitable resolutions expressive of the regret of the academy at the death of Dr. Asa Gray, the eminent botanist.

Frederick Gutzkow read a paper on "A New Method of Quantitative Determination of Bromine in Sea-water." The subject was exemplified by illustrative experiments.

HOWARD-STREET CABLE.—"Early in the spring" is the way that the officers of the Omnibus Railroad line express themselves as to the time that the work of converting the Howard-street branch of the horse line into a cable line will be commenced. Ground will be broken about the latter part of March and the cable line will take the same course as the present line, being a double-track road from the ferry slips to Twenty-sixth street. The roadbed will be constructed in the same substantial manner as the Market, Geary and California street roads, being of concrete with strong iron trackchairs. There will be no change in the width of the present track. The company has experienced considerable difficulty in procuring a proper site for an engine-house. They finally bought a piece of property on the northeast corner of Tenth and Howard streets. The engine-house to be constructed will be one of the best in the city and the machinery will be of the most modern manufacture.

A MINER'S DEATH.—On the 4th inst. Thos. Baker, a miner employed in the Kentucky mine at Gold Hill, Nev., was instantly killed. The shaft to which he belonged had just been relieved and Baker, with several other miners, had reached the surface. The cage in which they ascended was raised a few feet above the top of the shaft in hoisting. Before it was landed in the shafts Baker leaped from the cage-deck to the hoisting-works floor, striking his feet on the iron switch-plate in front of the shaft. He slipped, and in falling turned, and in scrambling to regain his feet plunged head first down the shaft to the sump at the bottom, a depth of 700 feet. His dead body, with the head nearly severed from the trunk and otherwise frightfully mangled, was brought to the surface on a cage a few minutes later. Deceased was an American, 35 years of age, and unmarried.

A BIG TREE.—We are advised by a party who saw the forest monster after it had fallen, that the largest redwood tree ever cut on the Pacific Lumber Co.'s possession was felled one day last week by Geo. McFaul and Mincey. The tree, which was irregular in shape at the butt, measured 16 feet in diameter one way, and 20 feet in diameter the other, at the stump. It was 200 feet long and tapered to 8 feet in diameter at the top. The tree was perfectly sound and without a limb. When manufactured, that tree would furnish lumber enough to build a small Mexican town.—*Humboldt Standard*.

THE mining companies upon the Comstock lode and in its vicinity disbursed a total of \$259,908 to employes during the month of January. The pay-roll of the Con. Cal. and Virginia amounted to \$49,351; Carson River mills, \$25,000; Water Company, \$25,000; Yellow Jacket, \$20,500; Savage, \$14,441; Hsie and Norcross, \$9155; California mill, \$11,441; Chollar, \$10,170; Potosi, \$10,024; Gould and Curry, \$8595; Crown Point, \$7700; Baltimore, \$7500; Alta mine and mill, \$6150; Ophir, \$4446; Sierra Nevada, \$3290; Mexican, \$1025; Union Con., \$969; Utah Con., \$3150; Nevada mill, \$2512.

ELECTRIC LIGHTS ON FERRY BOATS.—Arrangements are being made for the introduction of the incandescent light system on the ferry steamers between San Francisco and Oakland. The lights will first be placed in the Piedmont. A small dynamo will be operated by motive-power furnished by the engine, from which 135 lights will be distributed about the craft. Along the center of the saloon a row of 20-candle power lights will be placed, while those about the sides will be 16-candle power, making the interior as bright as day.

THE Northern Pacific has received the new rotary "snow-eaters," which are to supersede the old-fashioned snow-plows. The company has purchased three of the machines for use on the western end of the line—two on the Cascade division and one on the Rocky Mountain division. Superintendent Gilbert says they work like a charm.

## Passing Events.

The mining convention at Helena, M. T., to consider the question of preventing railway companies obtaining mineral lands on their patents is a very important move for miners. There has been so much of this sort of thing in the past that it is high time active steps were taken to prevent it in the future.

The question of allowing miners to take up mineral land in Indian reservations is about to come up in Congress. It has been one of the grievances of the mining community that so much mineral land has been lying dormant in reservations, and that it cannot, under present laws, be utilized.

New coal-fields are about to be opened on the northern coast, and active prospecting for coal is going on in all directions, owing to the high prices of fuel.

More of the copper mines in this State and Nevada are being opened than for years. The fact that copper is likely to remain at high prices for some time has encouraged the owners of these properties.

THERE is some talk that the Esmeralda Copper Company will start its furnace at Sodaville, Nev., soon. The works have been idle for a long time, and now that copper has taken a raise it would be profitable to that company to resume operations.

## Public Astronomical Observatories.

In conversation the other day with Alvan G. Clark, the famous telescope-maker, who has since returned to his home in the East, he remarked to the editor of the Press that the idea of the Chahot Observatory of Oakland was a wonderful one. The fact of its being open to the public nearly every night in the week was a new idea. He has seen observatories all over the world, but none conducted on this plan. He says New York, Boston, and other large cities would do well to follow Oakland's example in this respect. Of course he realizes that those in charge can do little scientific or theoretical work in such an observatory, but still numbers of people are being educated to an understanding of astronomical matters. He thinks too many persons consider astronomy abstruse and difficult, and that they imagine the whole subject as only one that can be appreciated by those of great knowledge of higher mathematics. "But," says Mr. Clark, "the best astronomers are not always the best mathematicians by any means."

Mr. Clark realizes, of course, that the observers at the Lick Observatory could not do very much work if visitors were at liberty to come and go as they please. But he is of the opinion that it is a good thing to have such institutions as the Chahot Observatory, where any citizen may have an "evening with the stars" and learn something of the working of telescopes, transit, time-clocks, etc.

The Chahot Observatory was given by the public spirited citizen whose name it bears to the public schools of Oakland as an educational institution. It was not intended as a place for scientific research, but to teach the pupils of the schools something about astronomy and astronomical instruments. The Board of Education of that city, in whose care it is, pay competent young men to stay at this observatory every evening, receive the parties who come, show them the instruments and give them an opportunity for an observation. The director of the observatory is the Oakland Superintendent of Schools, Mr. Fred M. Campbell, and the assistants in charge are Messrs. Burckhalter and Hill.

By application at the rooms of the Board of Education, a card is given to the applicant for a certain night, and the date of the expected visitor is properly registered. It is customary to make up small parties to make the visit, one card admitting the party. As a general thing, the evenings are engaged about three months in advance, which shows the popularity of the plan and the observatory. The visitor must take the chances on the character of the night specified. If it is foggy, he cannot come the next night, for that is engaged by others, but he must take his place at the end of the list.

The young gentlemen who receive these parties are, of course, enabled while observations are being made to impart much useful information and answer the many questions propounded by the curious or uninformed. By means of the transit, clocks and electrical apparatus, correct time is obtained and the city clocks regulated. The noon and curfew bells are also rung with great exactness from this observatory, connections having recently been made for this purpose.

The classes in the public schools have certain nights set apart for their convenience. Pupils of private institutions can also avail themselves of the observatory, and the public at large are welcome, providing they comply with the regulations as to registering. There is no red tape about the observatory, its affairs being conducted with great simplicity for a public institution. The founder of the observatory, recently deceased, left an additional \$10,000 to further perfect the institution.

Mr. Clark's remark that such an observatory would be of great value in other cities was a practical one. He could realize the use it would be in interesting and educating the public. That it attracted his attention is noteworthy, and, no doubt, he will frequently refer to it elsewhere. We should not be surprised to see the example followed in several other cities within the next few years.

THE jute-mills at Oakland now employ 250 whites and 100 Chinese. Very few of the skilled jute-workers who came from Scotland are now at these mills.

## The Magnetic Variation on the Pacific Coast.

In our edition of January 28th we made incidental reference to the discovery of recorded observations of the magnetic variation off and along the coast of Lower California and part of the eastern coast of the Gulf of California.

Since the article was published, Assistant Schott, in charge of the computing division of the Coast Survey, has made a special report upon the subject, and as the observations of 1714 very materially influence the formulae for computing the magnetic variation as far north as Monterey, we present extracts from this report.

The discovery of records of the magnetic declination A. D. 1714 off the coast of Mexico by Assistant George Davidson, and transmitted by him to this office, proved to be a matter of much importance by greatly increasing our knowledge of the secular variation of the declination.

By means of these observations I was able to improve materially the expressions for San Blas and Magdalena bay, to add the new station Cape San Lucas, and to make their influence felt as far north as San Diego and Santa Barbara. It is the range which is greatly improved, and, moreover, the epoch of maximum declination is shifted in the right direction.

Apart from the fact that a region of west declination is here for the first time observationally indicated on the Pacific Coast, the power of the newly recovered declinations is due to the circumstance that, as far as known, they cover a time when the needle was in or near a phase the opposite of the present one. \* \* \*

These early observations have given great weight to the correctness, or rather the applicability, of the derived expressions, to the whole period of time which the observations cover, 174 years.

The rediscussion with these observations has changed the epoch of the Eastern maximum of declination, so that now we are satisfied that for the following places the epochs are San Blas 1856, Cape San Lucas 1873, Magdalena bay 1875, San Diego 1883, Santa Barbara 1880, Monterey 1899. The easterly variation is therefore decreasing for all the stations except Monterey, and the rates of change are as follows:

San Blas 1885 decreasing yearly 2'.9, in 1890 3'.3; Cape San Lucas 1885 decreasing yearly 1'.2, in 1890, 1'.6; Magdalena bay 1885 decreasing yearly 1'.0, in 1890, 1'.4; San Diego 1885 decreasing yearly 0'.1, in 1890, 0'.4; Santa Barbara decreasing 1885 yearly 0'.4; in 1890, 0'.7; Monterey 1885 increasing yearly 0'.9, in 1890, 0'.6.

The expressions for the computation of the magnetic declination at the foregoing stations slightly changed, but for San Francisco it remains as we gave it.

In addition to these recovered magnetic observations, Professor Davidson has just discovered still more ancient records reaching back to the time of Drake and Cavendish, and extending from the northern limit of Drake's track off the coast of Oregon to the latitude of Acapulco, together with two very important observations in the West Indies.

## Foreign Miners in the Territories.

The amendment to the Alien Land law introduced by Senator Hearst, and to which we have before referred, has been discussed in the Senate. It allows foreign corporations to purchase and hold mining properties in the Territories. During the discussion, which was participated in by the Western Senators, it was urged that the measure was an absolute necessity, if the territorial mining properties were to be developed. This is well understood by any one who is familiar with the situation in the mining Territories. The big English companies have benefited every camp they have ever taken hold of. They put up large works, develop their mines for what there is in them, and employ thousands of miners. It is very probable the bill will pass.

An amendment was offered by Senator Mitchell and adopted, excluding Chinese corporations from the benefits of the bill. This will please some mining communities, but will not suit all owners of mining ground. In this State worked and surface claims are sold to Chinese who make money out of them. And this is

done in other places where there is surface ground to be mined. The Chinese do not take to quartz mining much on their own account. But the law does not apply to States in any particular, the Territories only being affected. There are some kinds of ground that only Chinese will undertake to work; but the miners generally, throughout the country, do not care to have them in the camps if it can be helped.

## Land Patents Cover Minerals.

People interested in the reservation of mineral lands should remember that it is very difficult to invalidate a patent when it has once issued to an individual or a railroad company. In a letter written by the Secretary of the Interior to the Commissioner of the Land Office, some time since, he says: "The statutory exception of mineral lands from the grant to the railroad companies is construed to include only lands known to contain valuable minerals prior to the issuance of the patent. The railroad company will therefore get a patent to all lands to which it is entitled, including mineral land, unless the Government is apprised of their character."

In an article in another column further remarks are made on this subject. It is unfortunate that so much mineral land has gone into private hands by the means described. At the mining convention, at Helena, Montana, Mr. O'Bannon of Deer Lodge spoke concerning the action of the N. P. R. R. and cited instances of large tracts in Deer Lodge county, where there were as high as 900 locations on a section, and it could be sold within a week for half a million dollars; and all this had been certified to as non-mineral land. An instance was recited where Patrick Cahalin had purchased a tract of land at the mouth of the Big Blackfoot and paid a big price for it. He afterward learned that there had been a previous location as mineral land, and that it was subject to relocation. He then wrote to the N. P. Company to protect him. The answer was that the best thing he could do was to locate it, and then have a good title and an N. P. title, and thus be secure.

Such things as these are outrageous. It is not the policy of the people of the United States to permit it, but the method of carrying out the laws is defective. We see now that in view of the great opposition to the issuance of the patents to the N. P. R. R., Government has sent out an expert to see if mineral land is being covered. Why should not Government be compelled to do this in all cases? The system might be abused, but it is much better than that now in vogue. Mineral lands are too valuable to be given to companies and individuals in large tracts, such as they get under the present system of land patents. The present move of the Montana people will have the effect of calling official attention to the matter in a way that cannot be ignored.

## The Rae Process at the Pan-Mill.

Mr. Mackey's California pan-mill on the Comstock has had one side fitted up for the Rae electric process in order to give it a thorough test. During the last month before shutting down, in a run of 22 days this process has effected a saving of 1760 pounds of quicksilver. It is said also that the magnetism has so affected the other side that a saving of five per cent is shown. Only half the mill is run with this process, and the saving shown is as compared with the corresponding other half of the mill not using the process. The run was not steady, there being considerable difficulty with the ropes of the motive-power, and the mill is now shut down while necessary changes are being made.

We are informed the management is satisfied that with a steady, uninterrupted run, the process will do a great deal better. Methods are to be adopted, also, so as to better influence the amalgamation as well as to save the quicksilver.

The tests which will be made of this process during the next run will be crucial. The appliances are all perfect and well made. By having one-half the mill running with the Rae process, and the other half without, a good basis of comparison can be had. The process has been so satisfactory elsewhere that its friends are confident it will effect all that is expected at this important mill.

## Mineral Lands.

As was recently remarked in the PRESS, by the loose method of carrying out our land laws, much of the mineral land of the United States has been taken up as agricultural. Once the patent for land has issued there is no redress. The patent carries the minerals as well as the land itself. The trouble is that the required "proof of non-mineral character of land" is only negative. That is, the claimant has not got to prove that there is no mineral; he simply says that to the best of his knowledge and belief there is none. Some one has got to go and protest, and then prove there is mineral in the land, in order to prevent a patenting. Now the man who has to prove that there is mineral has no interest in the subject at all, unless he has already discovered mineral. Three or four agriculturists, who do not know mineral when they see it, testify as to the agricultural character of the land, and so the patent issues. A good deal of this sort of thing has been done all over this coast, sometimes through ignorance, and sometimes through design.

But this taking up of mineral lands has not been done entirely by individuals. Of course the railroad grants generally except the minerals, but sometimes the patents issue before the mineral character of the land is determined. They are having trouble of this kind up in Montana, but the people there are alive to the fact that injustice may be done, and are taking steps to prevent the mineral-bearing regions from being taken up.

A meeting was held last week at Helena, M. T. The meeting was called to take action upon the attitude of the Northern Pacific railroad on the acquisition of public lands in Montana under their land grant. The grant excepts all mineral lands save those bearing coal and iron. Through ignorance or carelessness on the part of the Government surveyors much mineral land has been reported to the department as non-mineral land. It has been ascertained that the Northern Pacific railroad has had certified to it for patents a large amount of mineral lands under the representation of such surveyors that they were non-mineral in character. The convention was called to protect against the issuance of patents to the railroad company to lands which are not absolutely known to be non-mineral bearing. Memorials to Congress and the President were adopted. Proofs of the mineral character of the mountainous lands of Montana will be forwarded to Washington at once.

## Mines on Indian Reservations.

Representative Hermann has introduced a bill in the House for the disposal or sale of mineral land on Indian reservations, and also providing that timber on such reservations may be used for mining purposes when a compensation has been made. There will probably be considerable opposition to this bill from those persons who think the Indians should not be interfered with. The Indians themselves decidedly object to miners coming on to the reservations to prospect, for they know that when mines are discovered numbers of white men come. They are afraid that in such cases they will have to move elsewhere before the restless march of civilization. And it is pretty much so, to speak truly. A few groups of rich mines in a reservation would change the condition of affairs materially.

Yet the miners argue that there are large tracts of mineral lands on some of the reservations which are no good to the Indians and which should be utilized by the whites. They say that the working of the mines will not interfere with the hunting and fishing of the Indians, and will in no way injure the reservation.

It is known that there are mineral deposits on several Indian reservations of the West, and in some instances the authorities have had great difficulty in keeping prospectors and miners off. The discussion of Mr. Hermann's bill will no doubt bring up the old question of separate reservations or one great region in which all Indians shall be kept; and the fact that the question of admitting miners on reservations to work mines is being talked of will make them all the more eager to obtain the privilege.

The Idaho Mining Company of Grass Valley has paid in dividends, up to January 1, 1888, \$4,593,750.

## Hints to Prospectors.

## Plant Indicating Presence of Lead.

In the PRESS of last week were given some extracts from a paper by R. W. Raymond, concerning the existence of certain plants which indicated the presence of certain minerals in the soil. We gave an illustration of the *viola calaminaria* which has been found to indicate the presence of zinc. To this indicative plant may be added the "lead plant," *Amorpha Canadensis*. An engraving of this is given on this page, the drawing being of natural size, made from a specimen in the Columbia College herbarium. It is a low shrub, from one to three feet high, whitened with hoary down. Its leaves are very numerous and spring directly from the stem without foot-stalks. The leaflets, arranged in 15 to 25 pairs, are crowded, small and elliptical, with sharp, spiny terminals. Their upper surface becomes smooth

THE LEAD PLANT.

with age. The flowers are aggregated in spikes, the individual blossom being almost without foot-stalks.

The calyx-teeth are rather long, equal, and in shape between an egg and a lance-head (ovate-lanceolate). The color of the vexillum or upper petal is light blue. The plant is most abundant in Michigan, Wisconsin and Illinois, and ranges southwesterly. Descriptions of it may be found in Torrey and Gray's *Flora of North America*, vol. i., p. 306, and in Gray's *Manual*, 5th ed., p. 130. The name "lead-plant," locally given to it, expresses the belief of the miners that it indicates the presence of lead ore in the soil, or at least flourishes best where such ores exist. It is followed as a guide by prospectors in looking for the deposits of galena in limestone which characterize the region named, and which, as is well known, are scattered and irregular, and usually have no outcrops.

Another indicative plant has been reported to Mr. Raymond since his paper was presented, by Dr. F. Stapf, now of Berlin, who writes that, some years ago, during a visit to the neighborhood of Caeres, Estremadura, Spain, he was surprised by the skill with which the native prospectors located, in spite of surface gravel, the underlying outcrops of phosphorite. It is not easy to recognize scattered and more or less decomposed fragments of this mineral, particularly when sparsely distributed in the

debris of the silurian slates and the Devonian dolomite, along the contact of which it occurs. On inquiring whether any peculiar vegetation indicated its locality, Dr. Stapf was told that a creeping plant with bell-shaped flowers frequently, if not invariably, marked the spot. He collected specimens of this plant, growing along the contact referred to, but preferring apparently the slates between the Esmeralda and the Salvador mines, in the district named; and although flowers could not be obtained (it was in April, 1884), Prof. Ascherson of Berlin easily recognized it as *Convolvulus althaeoides*, a plant which is not uncommon in the northern parts of Africa and the southern parts of Spain, where it grows on limestone or even on sand.

## Cable Railway Patents.

A very important patent suit has just been decided in the Circuit Court of the United

States for the Southern District of New York. The Brooklyn bridge trustees have been using the Hallidie patents on the cable railway on the bridge. The National Cable Railway Co., who, in conjunction with the Pacific Cable Railway Co., own all the "bottoms" patents on the cable railway system, sued the bridge trustees. The decision has been rendered in which it is decreed that the re-issue letters patent granted to A. S. Hallidie, No. 7607, dated April 17, 1877, are good and valid, and that the title thereto is duly invested in the National Cable Railway Co.

It is further decreed that the bridge trustees have violated and infringed the exclusive right of the National Cable Railway Co., under these letters patent. The sum of \$4500 is awarded as damages for the infringement. "And it is further ordered, adjudged and decreed that a perpetual injunction issue under the seal of the Court, enjoining and restraining the said defendants from making or using said patented improvement during the term of said letters patent."

This decision is an important one, but was only to be expected. Several of the roads built in the East have endeavored to evade this and other patents. In doing so they have tried all sorts of impracticable plans and made many failures. Then, when they did adopt something practical, they infringed patents which had originated in San Francisco, where the cable

system is the most complete and perfect. The roads which have been built of late, however, have mainly purchased rights from one of the large companies mentioned, which, as stated, now own all the important patents.

## Foundry Notes.

The large-sized dredger built by the Golden State and Miners' Iron Works, is at work throwing up a levee on Ryer island from the bottom of the river. It makes about one and one-half miles of levee a month. This dredger has a hull 40x80 feet, with three spuds, raised or lowered by a donkey engine. The swinging boom is 105 feet long and the shears 50 feet, allowing the bucket to work to advantage at a depth of 35 feet. The bucket has a capacity of one and one-half to one and three-quarters cubic yards. The engines are 200-horse power. This dredger is the property of Reclamation District No. 501, and is run by two crews of four men each, day and night shifts, at an expense of \$1000 a month. About three miles of levee have been built. The whole distance around Ryer island is 22 miles, and upon its first round the dredger will put up a levee about six feet high with a 40 foot base to connect with the few miles of levee already laid up. The completed levee will be 12 feet high and 70 feet at base. Ryer island is north and west of Grand island, 30 miles below Sacramento, and is bounded by the west branch of the Sacramento river or Steamboat slough, Cache slough, Miner slough and Sutter slough. The Golden State and Miners' Works have made a specialty of dredgers, and all they have built do remarkably good work.

The scow Dayton, 80 feet in length and 30 feet in width, built for the use of the Carson River Dredging Company, was launched the other day. She will be equipped with steam machinery for dredging the river-bed to recover amalgam and quicksilver which has escaped from amalgamating pans in the stamp-mills, the value of which deposit in the river-bed is estimated at \$50,000,000. The steam dredging machinery is being constructed at the Pacific Iron Works in this city and is nearly completed.

It is expected that the cruiser Charleston will be completed by next September, or at the latest by October. By the terms of the contract with the Government, she should have been finished in August, but owing to the delay in procuring steel for her plates, it is considered impossible to have her ready at the time called for in the contract. Her engines are all completed and ready to be put into position at any time. About 600 men are at work on her at the yards of the Union Iron Works.

The new steam schooner Noyo was satisfactorily tested on the bay this week. Her engines, which are triple compound of 400 effective horse-power, were built by Hinkley, Spiers & Hayes. She has two high-pressure cylinders of 10 inches in diameter, one intermediate of 22 inches and one low pressure of 36 inches in diameter; the diameter of the propeller is 10 feet. She has steel boilers and two corrugated steel furnaces.

In a recent lecture by R. W. Raymond, secretary of the American Institute of Mining Engineers, he makes the statement that a detailed analysis of the pay-rolls of the Lehigh Coal Company for the 18 months from Jan. 1, 1886, to June 30, 1887, shows that every miner, good, bad or indifferent, skilled or unskilled, working by contract for the company during that period averaged \$2.72 for every day worked.

OWING to the publicity given of several rich strikes in various parts of New Mexico, a mining boom has taken possession of the people. In the past two months it is estimated that nearly 4000 locations have been made in the various mining districts of New Mexico, principally, however, in the southern part of the Territory.

THE SAN FRANCISCO MINING AND SCIENTIFIC PRESS has just published its annual mining review (a good one as usual), in which it makes liberal quotations from the *Courier*.—*Prescott (Arizona) Courier*.

THE water in the Carson river continues to rise, although there is no boom as yet, and none is desired. All the mills are running on full time and to full capacity.

## MECHANICAL PROGRESS.

## An Anti-Gas Acid-Resisting Alloy.

The *Engineering and Mining Journal* contains an interesting illustrated article on old Roman mining machinery, which were taken out of the Rio Tinto Company's mines in Spain. These mines, as is well known, were worked by the Romans and formed one of their principal sources of supply of copper 2000 years ago. The illustration represents a water-wheel which was unearthed on reopening an old part of the workings which caved in about 1500 years ago, and shows one of the methods adopted in those primitive times to mine their deep workings. The wheel is 14½ feet in diameter, and is one of many uncovered at various depths. The particular one photographed was found at a depth of 407 feet below the surface. It was made entirely of wood, put together with keys and pegs, the only pieces of metal about it being the axle, which is a shaft of bronzes about 2 inches in diameter and some 3½ feet long.

The most interesting thing connected with this find is the fact that the shaft was made from an alloy which had lain for all these centuries in water pregnant with sulphuric acid from the decomposing pyrites, but was entirely unaffected by its years of exposure beyond a slight film or coating of sulphate on the surface. When Mr. Ledoux saw the shaft last summer (it has since been presented to the British Museum), he was interested in ascertaining the character of a composition that could so successfully resist acids. It is an alloy practically containing, copper 90 per cent, lead 5 per cent, tin 5 per cent, there being just sufficient lead to form the coating of sulphate and prevent the further disintegration of the metal.

The water-wheel revolved in a pit, raising the water some 12 feet. At the point of discharge of the buckets a trough had been apparently located leading the water to another pit, whence it was raised by a similar contrivance and so on to the surface. The motive-power was furnished by slaves, who stood upon the wheel grasping ropes with each hand to steady themselves (the casts of these ropes in some instances have been found in the debris above the wheels), showing that these slaves worked the wheels in tread-mill fashion, stepping upon the projecting ends of the spokes or braces, which gave them a step about six inches wide by one inch high.

## Decomposition of Boiler Iron.

There is no one thing in boiler practice that gives the conscientious engineer more anxiety and real concern than the effect of salts in water upon steam boilers. This trouble is always present, and cannot be eliminated in many cases only by the use of rain or distilled water.

A correspondent at Norristown, Pa., writes to a technical journal as follows: "I am an engineer, and connected with a volunteer fire company who own a steam fire engine. It was placed in service Jan. 1, 1881, and on being inspected August, 1887, was found to be unserviceable or dangerous to use. The iron was 'pitted' or eaten full of holes all over, and half through the sheets; the tubes being copper, were in good condition. The shell and tube-sheets were of steel; tube-sheets ½ inch and shell 3-16 inch thick. We were compelled to have a new boiler built. We have other fire engines here that have been in service over 20 years, and they show no such action of the water upon them. If you desire further information as to water and conditions, will cheerfully furnish it."

Upon the above the editor remarks as follows: It is evident that the case described presents features that Colburn in *Transactions British Association*, 1884, describes as follows: "As a malady, corrosion corresponds in its comparative frequency and fatality to that great destroyer of life, consumption," and it has as many phases and periods of action. Corrosion is local and general, and is to be found in all boilers using water not chemically pure and on all iron exposed to air and moisture with carbonic acid.

It is evident that this is a case of "pitting," as it is called, and if other boilers using the same water do not groove or pit, we shall conclude that the cause was in the steel used. It may be possible that the metal used was impure, or had certain chemical qualities which furnished matter for the salts in solution or suspension in the water to feed on, or to attack, dissolve and thus leave cavities in the inner face of the metal. We have inspected several boilers that showed this action of water, and have been satisfied that the cause was with the metal.

A NINE-TON GUN CASTING.—The announcement is made from Pittsburgh that the nine-ton steel casting has been drawn from the sand, which, when bored and finished, it is hoped will demonstrate the practicability of making guns composed of a single steel casting, instead of building them up of a series of steel rings, shrunk on, in order to impart the necessary tension to the outer portions of the tube. So far as appearances go, the casting is pronounced to be perfect, but only the final test with powder and shot will determine whether or not the process is successful. If it proves to be so, then something of a revolution will probably take place in the manufacture of guns, because, by

this process, they can be made much cheaper, and the cost of killing people somewhat reduced. The gun will now be annealed and then bored. It will then be shipped to Washington, where it will be rifled and tested. In connection with the above we are told that the large guns, which it is proposed to make in this country, will be quite useless against recent armor plates. Says the *American Mechanic*: It is this old question of the irresistible force and the immovable body. The same question crops out in mechanics. A lathe or a planer is always wanted—and always will be—that will take a larger cut. So there will always be wanted a gun with more powers of penetration.

WELDING STEEL.—A correspondent of the *American Machinist* offers the following hints which he thinks may be of interest: All practical steel-workers know that with some kinds of steel it is very difficult to make a solid weld. In the first place, the two pieces of steel should be carefully scarfed, so that they will fit together well when taken on the anvil to weld, and, when practicable, a V scarf should be made, or, to make it plainer, split one end and point the other, and put together before they are put in the fire for the welding heat. This way of scarfing is much better, for, by so doing, the outside scarf can be hammered up close to the heel of the other scarf, so that dirt or small pieces of coal from the fire cannot get between the pieces of steel. I heat them slowly until they are an even cherry-red, then apply horax and bring the heat slowly up to pretty near a welding heat. Then take some soft iron filings and sprinkle over the steel where it is to be welded, put on more borax, if necessary, and bring it up to a welding heat. By the use of iron filings a much stronger weld can be obtained than by horax alone. I have tried several kinds of welding flux and other preparations for welding steel, but have never found anything so sure as wrought-iron filings and borax.

THE VALUE OF MILLING MACHINES is testified to by Mr. Jas. D. Hubbell of Cincinnati, who writes: "I want to state my experience with a gang of them used for milling joints for huggy tops. One set of mills last one month, making 600 joints per day, or 15,600 joints per month. Two machines mill the form, such machine milling half the circle, the third slotting the pieces, this being one-half the joint; then these machines make the other half only, the third machines cuts the tongue. One boy runs three machines and receives 15 cents per 100. The mills are sharpened once a week, costing 75 cents to sharpen. Then at the end of one month the mills are annealed and worked over. I have two sets of cutters that have been working this way for one year, making nearly 200,000 joints, or 400,000 good pieces, for there are two pieces to one joint, and, of course, there are some spoiled, which are not counted."

THE ENGLISH COPYING AMERICAN PRACTICE.—Recent designs of locomotives built in England and illustrated in English mechanical journals, says the *American Mechanic*, show a decided tendency toward American practice. One recently built for express and passenger service on the London & Southwestern railway, from the designs of the locomotive superintendent of that road, has a four-wheel truck, or bogie, in front, with outside cylinder, and has quite an Americanized appearance. There is no headlight to speak of, and no cab worth mentioning, but this latter feature is just perceptibly larger than they made them a few years ago, and perhaps indicates that they will eventually be made sufficiently large to constitute a shelter for the engineer worthy of the name.

MAKING CONICAL SPIRAL SPRINGS.—A correspondent of the *American Mechanic* says that a mechanic of Baltimore makes conical spiral springs in the following manner, with ease and facility: Wind the springs in the usual manner on a straight mandrel and close the ends back the distance required for the cone, by bending the coils in the jaws of a vise. Commence with the end coil and squeeze first on one side and then on the other, until it is somewhat reduced in size; then take the next coil, and so on as far as you want to go. Be careful to squeeze the coils in such a manner as to retain their circular form. It is a best, in order to get good results, to go over the cone a number of times instead of reducing each coil to the required size as you go along.

STEAM-ENGINE TESTS.—It seems impossible to conduct a series of steam-engine tests so as to give satisfaction in the results. Some time since we noted what appeared to be some remarkable results from the tests of small engines at a fair in England. Now we find that the accuracy of the methods employed in testing are questioned in such a way as to lead to the belief that the published results had no value.—*American Mechanic*.

THE CONSUMPTION OF POWER.—It has been ascertained that the horse-power required to run a machine shop, in which 700 men were employed, was 135.05, of which 66.81 horse-power was required to run the shattering, blowers, and such things as were not machine tools, leaving 68.24 horse-power to run the machine tools, or a trifle less than one horse-power for ten men.

## SCIENTIFIC PROGRESS.

## The Lore of Buried Cities.

An increasing degree of attention is being given to unearthing the remains of ancient cities. The results derived from these excavations are doing much to confirm the truths of recorded history and not unfrequently furnish new additions to facts and events previously known.

## The Buried City of Sybaris.

The statement that the Italian Government has decided to appropriate money for the excavation of the buried city of Sybaris will be received with pleasure by every one who remembers the valuable results which followed upon the unearthing of Pompeii. For Pompeii was after all but a village as compared with Sybaris. Making all due allowances for the exaggeration of ancient writers, says the exchange, the latter city was undoubtedly one of the wealthiest and most luxurious of which we have any record in the past. When the Cotronian army over 500 years before Christ vanquished its enervated populace, they turned the river Crasis upon its site with a view of wiping the town from the face of the earth. For 2400 years it has lain buried beneath the silt which the river deposited upon it. With the aid of the Athenians the survivors some years later founded the town of Thurii near the place, but from that day no trace of the buried city has ever been discovered. Doubtless the conquerors carried off with them many articles of golden and silver luxury, but there must yet remain countless art treasures gathered by a people who in their day were the business masters of a population numbering several millions. The faded beds of rose leaves have long since molded into dust, but there possibly exists many imperishable monuments of the cunning artificers whose skill in catering to the wealthy inhabitants has made the name of Sybarite synonymous with luxurious beauty.

## Prehistoric Central Africa.

Ruined and buried cities are now known to have existed near the central regions of Africa, of which the modern world has until quite recently had no knowledge whatever. The ruins of very ancient cities upon the seacoast just south of Zanzibar have of late been discovered.

The most indubitable evidence has recently been found that more than 2000 years ago there must have existed along the central portion of Eastern Africa a people who had advanced to a very high degree of civilization.

Some way south of Zambesi river there is a large region extending from the sea nearly 400 miles inland and 300 to 400 miles toward the south, in which ruins are constantly being discovered, proving that in prehistoric times the country was inhabited by a civilized people. To-day only the rudest black tribes inhabit this land, save in a few places where the Portuguese have established stations. The little beehive huts of the natives are seen among massive ruins, harkening a degree of architectural skill which rivals that of the ancient Aztecs. Our knowledge of these ruins is still far from perfect. Our earliest records of travel and trade on the East African coast, extending back to the beginning of the Christian era, do not mention them. Only in recent years have the travels of Selous, Erskine, Mauch, Baines, Mohr and O'Neill revealed to us the monumental evidence this country contains.

The coast town Sofala is shown on all maps of East Africa. Near that town Carl Manch found extensive ruins remarkable for their enduring nature and strange shapes. There are partly ruined walls, still 30 feet high and 12 feet wide at the base, built of small hewn blocks of granite. In these walls, sometimes 15 or 20 feet from the ground, are embedded one end of blocks of stone 18 to 20 feet long, which were evidently used to support galleries. Here and there, built in the walls or standing by themselves, are round stone towers which evidently rose to heights of 30 to 50 feet. Similar masses of masonry are found as far as 350 miles inland and a little north near the coast.

It is not positively known yet who built these ancient structures. No trained archaeologist has visited them, and no search has yet been made for inscriptions, though O'Neill says he has no doubt from what he has recently heard that there are numerous inscriptions on the ruins about Manica. All these ruins are surrounded by surface gold mines. It is believed that all this country was occupied some time before the Christian era by a great colony probably of Phœnician origin, and that its chief occupation was gold mining.

Mr. O'Neill says that these numerous ruins are nearly as well preserved as those of ancient Egypt, and better than those of Assyria. Some day, no doubt, they will be systematically studied. Their existence shows conclusively that a large region in inner Africa, now given up to savage men and wild beasts, was subject many centuries ago to the control of a people who were considerably advanced in the arts of civilization.

## Late Discoveries in Ancient Egypt.

Very important discoveries have been made during the past year among the ruins of the ancient cities of Egypt. The results of these explorations were recently recounted by M. Naville, the famous discoverer of the treasure city of Pithom in an address before the Society of Arts in London.

The excavations at Tel-el-Yahoudieh were designed chiefly to corroborate the account given

by Josephus of the construction of a Hebrew temple by Onias in the time of Ptolemy Philometer and his half-sister, Cleopatra. M. Naville's subsequent work at Bubastis, which was more successful, brought to light the columns and foundations of the great temple described by Herodotus as the most beautiful in Egypt. The ruins here were very ancient, columns with palm and lotus capitals pointing as far back as the twelfth dynasty. The oldest monument was a cartouche of Pepi I, a Pharaoh of the sixth dynasty of the remote pyramid period, and a very large number of most interesting inscriptions were disclosed. Only one-third of the work of turning the massive blocks of stone in the search for inscriptions was done.

These results, while tending to confirm the historical accuracy of Josephus and Herodotus rather than to throw light upon mooted problems of the Pentateuch, are of the highest archaeological importance and amply justify the recent appeals of the Egypt Exploration Society for financial aid in prosecuting the work.

## The Three Forces—Physical, Vital and Psychic.

[No. 16.]

[Written for the Press.]

In the lowest forms of animal life we find nothing answering to the brain as we know it in the higher forms; the circle of nervous filaments which surround the neck of the esophagus of the star-fish, and which contain but a few nerve cells, can scarcely be termed a brain proper; it, however, connects the nerves which belong to each ray, and hence is an indication of a system for combining movements which reaches its highest perfection in man.

The Nematoid worms, the larger parasitic ones at least, possess a nervous system slightly more compact, a larger number of ganglionic cells; and also from the papille, which have a tactile function and surround the mouth, are derived a few nerve fibers, a few groups of cells are also in close connection with these latter.

In the Nemertide, a marine worm, whose bodies are covered with cilia, and are very soft and contractile, there are two or more dark spots just behind the mouth which answer the purpose of rudimentary eyes or ocelli. A pear-shaped ganglion on each side of the animal's pharynx receives the nerves from each ocellus on its own side, and the two ganglia are connected by other fibers which pass some above, others below, the esophagus, thus forming a ring; from these also proceed the lateral nerve trunks which supply the muscles of its body. A large number of small nerve cells are in these pear-shaped ganglia, the whole being of a slight reddish or pink color.

In the earth-worm two upper ganglia supply the place of the lateral ganglia in the Nemertide. The connecting nerve fibers are also connected with a single lower ganglion; the lower halves accordingly coalesce, and as the result we have a double nervous cord traversing the entire ventral side of the body. In this worm there are no ocelli; the upper lip has tactile powers and is connected with the upper esophageal ganglia; its sense of taste is questionable.

Along the course of the double ventral cord, we have a more abundant collection of cells at each segment of the worm. This forms a ganglionic swelling from which is given off two nerves on each side. The anterior part of the segment is supplied by a few nerve fibers given off from the cord itself just anterior to the ganglion, thus securing concerted movements of the segments. The visceral system is supplied by a complicated ganglionic network on each side of the esophagus, starting from the commissures which unite the two upper ganglia, thus securing a concerted movement in the intestinal system. Here again is the shadowing forth of a nervous mechanism which is perfected in higher animal life. Can it all have been "by the gradual fortuitous and unguided operation of infinitely slow moving causes" that the progress toward perfection has been so infallibly maintained?

In the leech a still greater concentration of the nervous system obtains, a spinal ganglion doing duty for three or four segments, and the double ventral cord becoming almost fused into one, a hilobed ganglion receives the nerves from the tactile lips, and also the nerve fibers from ten ocelli which are situated around their margin. This hilobed ganglion is situated above the mouth, and corresponds with the brain of higher animals. It sends a nervous cord down each side of the esophagus which unites with its fellow, forming a supra-esophageal ganglion. From this ganglion, in form heart-shaped, are given off the nerves which supply the cutting jaws and the sucking muscles of the mouth. A correspondence with the "medulla oblongata" of vertebrate animals is here noticeable. It is continuous with the double ventral cord on which are developed 20 equidistant ganglia, which give off two nerves on either side, for the supply of adjacent segments.

The dorsal surface of the alimentary canal is supplied with a filament of nervous substance, by the supra-esophageal ganglion. Here is a foreshadowing of an important system of nerves. The sympathetic and the pneumogastric (lung and stomach) nerves in higher animals. Among invertebrates this is known as the "stomatogastric system." The commissures in many other of the invertebrate series connecting the upper and lower ganglia, rather than the ganglion itself, give rise to this system of nerves.

## USEFUL INFORMATION.

**EFFECT OF FROST UPON HYDRAULIC CEMENT.**—The following German experiments designed to ascertain the effect of frost upon hydraulic mortars and cements gauged with and without the addition of salt to the water have been quoted in the *Revue Industrielle*. Cubes of stone 6 c. m. area were used in these experiments, and were joined together with cement mixed with water ranging from pure rain-water to water containing from 2 to 8 per cent of salt. While the cement was yet fresh, the blocks were exposed in air at a temperature of 20° to 32° F., after which they were kept for seven days in a warm room. At the end of this time the specimens were examined. The cement made with pure water was quite crumbled, and had lost all its tenacity. The cement mixed with water containing two per cent of salt was in better condition, but could not be described as good; while that containing eight per cent of salt had not suffered from its exposure to the lowest temperature available for the purposes of experiment. It is possible that the salt merely had the effect of preventing the water in which it was dissolved from freezing at the temperature named, and so permitted the cement to set in the ordinary way. These results may, however, be usefully cited at this particular season, when outdoor building operations are liable to be suspended on account of frost, and the stability of green work is threatened by the same influence.

**ATMOSPHERIC RESISTANCE OF PAINT.**—Experiments made under the direction of the Dutch State railroads with various plates are reported to have proved that the red lead paints resist atmospheric influence much better than those of brown-red and iron oxides. The red lead paints adhered closer to the metal and possessed greater elasticity than the others. It was also found that better results were obtained if, before the paints were applied, the plates were pickled instead of being merely scraped and brushed. The test plates were pickled in muriatic acid, washed with water, thoroughly dried, and, while warm, carefully oiled. As iron and steel are peculiarly liable to corrosion when in salt water, vessels made of them require special protection. This can be given by covering the metal with some alkaline or basic substance, or the oxide of some metal electro-positive to it. Caustic lime and soda are very efficient for this purpose, and act equally well when made into a paint with oil, but their efficiency is destroyed when they cease to be caustic or when they are saturated with carbonic acid, which they absorb freely from the air. Magnesia is equally efficient, and does not absorb carbonic acid. It therefore makes as good material for a paint as could be desired; and, moreover, forms an excellent basis on which to lay an anti-fouling paint, which it protects from the galvanic action of the iron by insulating it, while it does not affect the anti-fouling qualities.—*Manufacturer's Gazette*.

**OIL ON THE WATERS.**—A German has taken out a patent for a device to be used on ship-board for distributing the oil upon the sea about the ship so as to reduce the destructive effect of the waves, and it is said that the right of the invention has been purchased by an officer of the North German Lloyd line. This consists of a rocket, to which is attached a cylinder filled with oil. The rocket can be fired with accuracy, and when it explodes the oil is scattered just where it is wanted. Several interesting experiments were made between Bremen and New York. In one the rocket was fired to a distance of 1500 feet and less distances. By the explosion of five rockets at a distance of from 1200 to 1500 feet from the ship, a space of 1500 to 2000 square feet of water was covered with oil and the waves were at once smoothed. The rocket was fired 900 feet against a gale. The importance of the invention to deep-water sailors consists in the certainty of explosion of the rocket at a sufficient distance to leave the vessel in calm water during a gale.

**COTTONSEED FOR ADULTERATION.**—It is estimated that about 50,000,000 pounds of cottonseed oil were used in the United States last year in the adulteration of lard mixed with about twice as much of other material, most of which was pure lard with the leaf left out. This total of 150,000,000 pounds is a little less than one-half of the exports, or about 30 per cent of the whole production. From this it may be inferred that cottonseed oil forms about one-tenth of all the material which is sold as "lard" in the United States, and nearly all of it is used in a few well-known establishments in New York, Philadelphia, Chicago, St. Louis and Kansas City.

**ASBESTOS CLOTH** is being used for wearing apparel by the firemen in Paris. The firemen, according to a newspaper report, arrived at the scene of a recent fire—the basement of a house—clad in asbestos cloth suits, and were enabled to descend into the basement and master the flames in a short time. The firemen of Japan have long worn asbestos armor.

**INCOMBUSTIBLE PAPER.**—A paper that resists the action of both fire and water has, it is said, been recently invented in Germany. The manufacture is accomplished by mixing 25 parts of asbestos fiber with from 2 to 30 parts of alumi-

num sulphate. The mixture is moistened with chloride of zinc and thoroughly washed with water. It is then treated with a solution of one part of resin soap in 8 or 10 parts of a solution of pure aluminum sulphate, after which it is manufactured into paper, as is done from ordinary pulp.

**"PETROGEN."**—It is now proposed to give natural gas a new cognomen. The Oil City Derrick has found what it considers fills the want. It says: "Now, that which is commonly called natural gas is as truly a rock gas as petroleum is a rock oil. Neither may be the natural product of the rocks, but they are obtained from or by drilling into the rock. As gas is an appropriate root or term for gas, we would suggest the name of petrogen for what is now called natural gas. The use of words of similar derivation in this way would carry the impression immediately to the mind of the close affinity between oil and gas from the rocks, between petroleum and petrogen."

**AN EMERY-WHEEL** may be very readily turned up by using a bar of wrought iron, or, better yet, a bar of copper, instead of a diamond. The reason for this is that the wrought iron or copper being soft, whether the grains of emery are removed from the wheel or not depends upon which is tougher, the metal or the cement.

**RAINFALL OF THE GLOBE.**—It is estimated that from 34,000 to 35,000 cubic miles of rain falls every year upon the surface of the globe. The rivers carry off barely one-half; the rest disappears by evaporation, by the absorption of the earth and by being taken up by plants, animals and mineral oxidation.

**ABOUT 2500 words** are all that are used in ordinary talking and conversation, although there are some 20,000 words in the English language. Different authors vary in the number of the words they use, but the difference is but slight. Shakespeare found 4000 words sufficient for all his works.

**TO PREVENT MILDEW.**—A solution composed of alum, 2 pounds; water, 60 pounds; blue vitriol, 2 pounds; gelatine, 1 pound; acetate of lead, ½ pound—all thoroughly mixed, will prevent mildew from affecting wood, clothing, fabrics, etc.

**ALUMINUM FOR DENTAL PURPOSES** is said to be coming into favor. It is pronounced better than rubber and less in cost than gold. It is bright, strong, odorless, and as healthy to the gums as gold or platinum.

## GOOD HEALTH.

## The Cancer Discussion.

Much attention has been given by European medical societies to the occurrence of cancer in certain localities which seem to favor the multiplication of cases. The following are given as a specimen of its prevalence within a circle of some few miles of this city:

Mrs. J. M. Dougherty had surgical operation Aug. 6, 1887; died Dec. 22, 1887, aged about 70. Mrs. McFadden near San Leandro was affected much the same as Mrs. Dougherty and had two operations. Died during the present year, aged about 50.

Mr. Wm. Tehan near Dougherty's Station died from cancer of throat, no operation, aged 45.

Mrs. Peterson, Contra Costa Co., at Danville, operated on by Dr. Lane, pronounced cured, aged about 43.

Mrs. Armstrong of Hayward had two operations; her physicians now propose to remove both breasts.

"These four ladies all had cancers upon the breast, and, living near here, have come under my observation." So writes our informant.

"These are all late cases. It is very strange there should be so many; I cannot understand why."

Mrs. Mendenhall (an old patient of Mrs. Dr. Cook's) is said to be quite well, only a bare trace of the swelling left; treated May, 1885.

In a paper given in this month's *Scientific Monthly*, Robert Morris writes: "Treatment by medicines is of no avail in curing malignant growths. The reason why medicines are useless in such cases is evident (sic) if we look at the subject through the germ theory." Now, there has been no cancer microbe discovered as yet, and we must reckon it a pure assumption on Dr. Morris' part, who unscientifically says: "It is safe to say that we will never have a drug which will cure cancer." He goes on to propose that legislation should be called to the surgeon's aid to suppress all attempts at curing cancer except by the "operator's fingers aided by sharp eyes."

Summing up the points of an address on "What constitutes the malignancy of cancer?" on the other hand Dr. Herbert Snow of the Cancer hospital, London, expresses the opinion, which is gaining ground among many close clinical observers of this more and more widely extending disease, that the phenomena designated by the term cancer "result from conditions which irritate normal protoplasm, cause it to proliferate abnormally, and to assume a quasi parasitic vitality. These conditions may be mechanical; in a much larger proportion they are neurotic. That is the farthest point we have yet reached;

nor do I yet see how our knowledge of causes can make much advance until we know far more than at present about the ultimate properties of protoplasm, and the manner in which this is influenced by certain states of the nervous system."

Intelligent local medication, combined with such drugs given internally as will build up the nervous system, and cause a diminution of the parasitic growth, is the rationale of the treatment which has had such success in this city; the long-continued immunity from any recurrence of the disease in those who have been cured bears out the views of Dr. Herbert Snow. An early application of whatsoever treatment he adopted is absolutely essential. Waiting for the appearance of invisible microbes and doubtful cells is only hastening the evil day.

## To Save Doctors' Bills.

Never go to bed with cold or damp feet. Never lean with the back upon anything that is cold.

Never begin a journey until the breakfast has been eaten.

Never take warm drinks and then immediately go out into the cold.

After exercise of any kind, never ride in an open carriage, or near the window of a car for a moment; it is dangerous to health or even life.

Never omit regular bathing, for, unless the skin is in regular condition, the cold will close the pores and favor congestion or other diseases.

When hoarse, speak as little as possible until the hoarseness is recovered from, else the voice may be permanently lost, or difficulties of the throat be produced.

Merely warm the back by the fire, and never continue keeping the back exposed to the heat after it has become comfortably warm. To do otherwise is debilitating.

Never stand still in cold weather, especially after having taken a slight degree of exercise, and always avoid standing on the ice or snow where the person is exposed to the cold wind.

When going from a warm atmosphere into a colder one, keep the mouth almost closed so that the air may be warmed by its passage through the nose ere it reaches the lungs.

Keep the back, especially between the shoulder blades, well covered, also the chest well protected. In sleeping in a cold room establish the habit of breathing through the nose, and never with the open mouth.—*New York Mail and Express*.

**CONDIMENTS AND INDIGESTION.**—Cayenne pepper may be selected as a typical example of a condiment properly called. Mustard is a food and condiment combined; this is the case with some others. Curry powders are mixtures of very potent condiments with more or less farinaceous materials and sulphur compounds, which, like the oil of mustard, onions, garlic, etc., may have a certain amount of nutritive value. The mere condiment is a stimulating drug that does its work directly upon the inner lining of the stomach, by exciting it to increased and abnormal activity. A dyspeptic may obtain immediate relief by using cayenne pepper. Among the advertised patent medicines is a pill the active constituent of which is cayenne. Great relief and temporary comfort are commonly obtained by using it as a "dinner pill." If thus used only as a temporary remedy for an acute, and temporary, or exceptional attack of indigestion, all is well; but the cayenne whether taken in pills or dusted over the food, or stewed with it in curries or otherwise, is one of the most cruel of slow poisons when taken habitually. Thousands of poor wretches are crawling miserably toward their graves, the victims of the multitude of maladies of both mind and body that are connected with chronic incurable dyspepsia, all brought about by the habitual use of cayenne and condimental cousins. The usual history of these victims is that they began by overfeeding, took the condiment to force the stomach to do more than its healthful amount of work, using but a little at first. The stomach became tolerant of this little and demanded more; then more, and more, and more, until at last the inflammation, ulceration, and torpidity, and finally the death of the digestive powers, accompanied with all the long train of miseries to which I have referred.—*Knowledge*.

**DYING.**—A leading physician says that a patient who is lying dying of exhaustion is generally dying of starvation. We give him beef tea, calf's-foot jelly, seltzer and milk—that is, a small quantity of the sugar of milk and some fat; but the jelly is the poorest sort of food and the beef tea is a mere stimulant. The popular belief that beef tea contains "the very strength of the meat" is a terrible error—it has no food value.

**TREATMENT OF POLYPUS.**—It is recommended by Dr. Bell of Canada to treat nasal polypi by daily injection of tannin, from five to ten drops of a concentrated solution being injected by means of a hypodermic syringe. After a few days of this treatment, the polypus sloughs and comes away without bleeding.

**TOBACCO AT YALE COLLEGE.**—About 20 per cent of the Freshman class at Yale University use tobacco. The average heretofore has been only 16 per cent. Dr. Seaver finds, however, that the class is unusually healthy, though not provided with a large number of large men.

## Spring Valley's Lengthy Aqueduct.

The new pipe of the Spring Valley Water Company has been laid under the bay. The length of the pipe under water is 14,000 feet, and the entire length of pipe from the new catchment reservoir in Alameda county to Crystal Springs, San Mateo county, is 27 miles. Starting from the reservoir on Alameda creek, the tube conduit generally follows the line of the old Valljo mill flume; passing Vallejo's mill, it crosses the Alameda creek on a bridge, thence going in a southeasterly direction along the public road through the towns of Centerville and Newark. Thence it follows along the railroad right of way, through the salt marsh, on a pile trestle to Dumbarton Point, crossing a navigable slough 300 feet wide, with submarine pipe, on the way. It then crosses San Francisco bay in a southwesterly direction, there being a double line of 6300 feet of submarine pipe, to the westerly shore of the bay. From this point it runs first along a pile trestle about 2000 feet long through the marsh, and in a southwesterly direction, to the public road. Thence it follows the public and county roads through Menlo Park, Redwood City, Belmont and San Mateo to the junction with the 44-inch Crystal Springs pipe.

The piping, which was made by the Mason Iron Works of this city, is of wrought iron, and except where it crosses the bay is 36 inches in diameter. That which crosses the bay is 16-inch tubing, five-sixteenths of an inch thick. Previous to its being laid it was galvanized inside and outside, and then dipped in a preparation of asphaltum. The bay where the piping crosses it is about 7000 feet wide. From the Alameda shore the bed of the bay slopes to a depth of 60 feet and then gradually rises again, leaving a navigable passage about 2000 feet wide. From this point to the western shore the bed is from 15 to 10 feet below the water, except in one place, where it appears above the water at low tide. For the supply of water which will be conducted through this pipe line it will be necessary to erect new pumping works, as the water has not sufficient pressure of itself to carry it as required. There are 15 miles of pipe yet to be laid on land.

## Amalgamating Gold.

## Use of Silver-Plated Plates.

The saving of the gold after it is separated from the ore is one of the principal troubles of the millman and metallurgist. Formerly blankets, gunny sacks and other fibrous materials were mainly employed for this purpose. Then came copper plates, but finally these have been superseded by the use of copper sheets plated with silver by voltaic electricity or galvanism. These silvered plates possess great advantages not only over the fabrics mentioned, but also over the unprepared or ordinary sheets of copper, the large amount of quicksilver they are capable of holding enabling them to catch and retain the fine and float gold which escapes these other appliances, the extra quantity of gold so saved paying the entire cost of these articles in a very short time. They are of simple construction, easily attended and kept in order, and capable of being replated when the silver wears off.

The most extensive and the earliest established Silver-Plating Works on the Pacific Coast are at 653 and 655 Mission street, San Francisco, E. G. Denniston, proprietor.

By reason of the superior work here turned out, this establishment does a large business, the Denniston plates being in very general use throughout the entire mining regions west of the Rocky mountains; also in Mexico and Central America.

As it is important not only that the work be well done, but that the silver applied to the plates be of full weight, they should be ordered of reliable and responsible parties, such as Mr. Denniston is known to be. It is said that this manufacturer has in his possession more than a thousand letters from millmen and metallurgists on the Pacific Coast, testifying to the superiority of his silverized copper plates. He has also been awarded the first premium at all the fairs of the Mechanics' Institute for the last 12 years.

These plates are made to order—plain, corrugated or filled, and of any size, shape, or thickness of copper desired. The silver is put on by weight, the amount being determined by the prices. His circular, which will be furnished on application, gives full particulars.

**NATHANIEL S. KEITH** has filed a bill of complaint in the United States Circuit Court against the Pacific Coast Electrical Construction Co. and the Oakland Electric Light and Motor Company to restrain the defendants from manufacturing and using certain dynamo electrical machines, of which he claims to be the inventor. He claims that the defendants have infringed on his patents and sues for damages, to be determined by the court.

**A NOVEL ARMAMENT.**—The Cramps of Philadelphia have a contract to furnish a large gunboat to be fitted with a Zuluski cannon. The cannon proper will be 60 feet long, and is fired by compressed air forced through a number of tubes—35 in number. The cannon will throw a dynamite cartridge accurately seven miles.

**SPEED FOR A GRINDSTONE.**—A grindstone with 4-inch face, 40 inches in diameter, with 24-inch shaft and 10-inch collar on each side may be safely run at 75 revolutions a minute.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

### CALIFORNIA.

#### Amador.

**SUTTER CREEK.**—Cor. Amador Ledger, Feb. 9: The first cleanup has been made at the Wildman mine. There is always much interest attached to the first cleanup of a new mill, as it affords a fair basis of calculation whether the ore crushed is of a grade to warrant expectations of a long and prosperous career of mining activity. The result in this case, notwithstanding that a considerable portion of the rock was taken from the dump, was satisfactory beyond all expectations. The amalgam was retorted last week and sent to the mint at San Francisco; Mr. Tregloan, the superintendent, has also gone down in the interest of the company. The other mines around here are running all right, and are expected to clean up in a few days.

**DRYTOWN.**—A fine-looking ledge, about two feet wide, was struck in the Cosmopolitan last Thursday. A number of pieces showing free gold and good-looking sulphurets were taken from the ledge. Stringers varying from two to six inches seem to be coming from every direction. Indications are good for striking the main ledge before many days. Carrara & Mayden have just finished crushing about 200 tons of rock taken from the North California. The Potosi Co. have about 200 tons of ore on the dump. The mill commenced crushing this morning.

**AMADOR GOLD MINE.**—Amador Ledger, Feb. 11: Work is being pushed ahead again at this mine on two shafts. Between 15 and 20 men are employed. The idea of sinking the large three-compartment shaft to strike the east ledge has been abandoned for the present. It is understood that Rankin, Brayton & Co. of the Pacific Iron Works, who have taken the contract to build a 60-stamp mill for the Co., will immediately proceed with the work. Of course, it will all be made and fitted in San Francisco, so that the work on the ground will occupy but a few weeks. The company will make the foundation for the mill. Every safeguard, we are informed, has been provided for so as to secure a good, substantial working mill. It will be erected at a point in Hunt's gulch, where a pressure of over 200 feet can be had.

**KENNEDY.**—The condition of affairs at this mine is not as bright as could be wished. Over 20 men have been discharged lately, on account of the exhaustion of ore in the levels from which the mill has been chiefly supplied. The lower level, 900 feet deep, has not been operated for several months, as the water has risen above it, and with the present appliance for taking out the water, it is difficult, if not impossible, to keep it free and keep the mill going at the same time. It is now intended to sink 100 feet and perhaps 200 feet deeper, which will take from three to four months to complete. The mill will be idle most if not all of this time, and the force of employees will be correspondingly reduced. The repairing of the north shaft is progressing, but will take another month to complete.

**PLYMOUTH CON.**—The Pacific shaft was again opened last Saturday, when it was found that the fire was still burning, and the air so bad that it could not be approached. Everything was again closed, and it is reported that no effort will be made to reopen again for several weeks. All the men at the Empire were discharged early last week, which in itself is a serious blow to Plymouth, as this mine gave employment to more hands than its richer neighbor, the Pacific. It is said that henceforth the Empire will not be operated except through the Pacific. If this be so, it means the shutting down of one of the 80-stamp mills, as both cannot be kept running through one shaft. Many miners have already left Plymouth, and more are leaving daily. The impression is strong that things will be moving along as briskly as ever in the course of a month or two.

**MISCELLANEOUS.**—The roller quartz-mill of the McKenzie Bros. near Irishtown is being moved to another location a short distance above its old site. The five-stamp mill on the Spagnoli Bros.' mine near Clinton has been running steadily for two weeks, with good indications. There are only two or three men working at the big tunnel at Middle Bar. R. Ruyné has quit the boarding-house and moved his family to Jackson.

#### Butte.

**COAL MINE DISCOVERED.**—Grideley Herald, Feb. 8: Last week two gentlemen prospecting in the Ruttes near Sutter City opened up a vein of coal. Specimens of the article were brought to this city Saturday. Assisted by several others, we have tested the fuel this week and pronounce it a good specimen of what is known in the East as "cannel coal." It is a good coal for heating purposes, but not very valuable for steam-making, lacking the combustible gases peculiar to the anthracite species. It burns slowly, making a good flame, and does not slack or break up as quickly as the varieties used for manufacturing purposes. If the vein is, as reported, two to four feet in width, and has any depth, the finders have got a better thing than the best ranch in Butte. We apprehend the deposit to be an extensive one.

#### Calaveras.

**RESUMED.**—Mountain Echo, Feb. 8: Work was resumed in the Star of India mine, situated near Smith's flat, one day last week. This mine is owned by Curtis & Co., and we are informed is looking exceedingly favorable. The ledge is said to be about 20 feet in width, and the rock is estimated to yield not less than \$3 per ton. The owners feel quite jubilant over the present outlook.

**COPPEROPOLIS.**—Cor. Angels Record, Feb. 10: Several times a day we hear the whistle of the Union copper mine, giving notice to the people that the revived enterprise is still being pushed ahead. The 20 years vacation in the working of this rich mine has been a tedious and even dreary postponement of the hopes and expectations of people hereabouts, but finally the revival has set in. The Union was visited by its agent, Mr. Ranlett, about eight months ago, and now the buildings look very much renewed and brightened up. Since the water is out and the ore stopes open, the noise and activity about the place are of great interest to our residents. A son of the agent, Ranlett, and J. A. Fersen, the boss, appear to be the resident managers. The output of

actual copper ore, put up in strong sacks of some 150 to 175 pounds, already shipped to Milton, or now on hand, aggregates about 300 tons. This presents an idea of business the significance of which is not to be mistaken—and an improvised assay office is inclosed under the big shed close by, and every day the quality of the ore is tested, which we are informed will reach about 16 per cent. Where this ore is sent to we have not yet made inquiry, well satisfied with the constant but moderate increase of men which now numbers around 40.

#### El Dorado.

**STRUCK A LEDGE.**—Placerville Observer, Feb. 11: The El Dorado big tunnel, toward which all eyes have been turned and which has been the center of attraction among mining men ever since the work was started of driving the tunnel, has at a distance of 250 feet struck a three-foot ledge, in which the quartz prospects free gold. This will be good news to the stockholders. The work of driving the tunnel is being pushed rapidly ahead under the efficient management of Superintendent McNeil, and he expects to strike the next ledge within 62 feet. Beyond this and the goal to which the company is striving, lies the mother lode. This is supposed to be a veritable bonanza.

**ZENTGRAFF.**—The Zentgraff mine, at Wild Goose, is now running day and night. This mine employs about 40 men, and is one of the few mines that have been working profitably from the start. They are now engaged in running a lower tunnel, and as soon as the lead is struck another mill will be erected. Both mills can be kept busy pounding out the precious metal, as the ore is easily extracted.

#### Inyo.

**THE SODA WORKS.**—Inyo Register, Feb. 11: The Soda Co. is cutting out two acres more of vats near old Swansea, and it is stated will shortly begin a lot of new work at the south end of the lake. They are shaping a huge monopoly of the only soda lake in America, and for the sake of the enormous business to be evolved out of it in case a process can be found enabling them to compete with the German product, the enterprise is grand and decidedly commendable. Engineer Wrinkle is still operating on his experiments at Dayton, and a new experienced chemist from Europe is soon to be in active charge.

**MINING NOTES.**—The Union mine (Cerro Gordo) lessees are shipping about two carloads per week of ore and concentrates from the new depot at Boland, south of Keeler. The new works at that point are now in good shape for steady work all summer.

**MINING SALE.**—Independent, Feb. 11: The Dark Horse mine, near Bishop creek, has been sold. The buyer is Mr. W. Charles, as agent for other parties. The mine was owned by four parties, two of whom are J. G. Bircham and F. P. Blaisdell, both of Round Valley. A good deal of prospecting has been done on the Dark Horse, and a very large ledge has been developed, said to be about 60 feet wide. The ore is low grade, but there is an immense amount of it, it is easily mined, and there is an excellent site for a mill and an abundance of water. A very large mill will likely be built soon and the mine worked on an extensive scale.

#### Nevada.

**ENCOURAGING PROSPECTS.**—Foothill Tidings, Feb. 9: The shaft at the Brunswick mine is now at a deeper point than has ever been attained heretofore. A solid ledge varying from 2½ to 3 feet in thickness and between two as pretty walls as man would want to look at, according to Supt. Tilley, justifies the opinion that the prospects are better than any previous developments have shown. The rock shows sulphurets in quantity and of good quality, and improves with depth. A level known as the 300 and which was the deepest workings of the old companies has been passed through by the shaft. In this level drifting will be done. There are 14 men employed at the Brunswick, and this number will be augmented next week, when stoping will be in order. The mill will start up at about the same time.

**A RICH STRIKE.**—Foothill Tidings, Feb. 10: Recent developments at the Pennsylvania have been the cause of much talk among mining men, and it is confidently believed the pay lead has at last been struck. Two weeks ago Capt. James Hamill & Co., lessees of the mine, uncovered a two-foot ledge of very rich ore in the bottom, or 300, level north. Pieces of the rock on exhibition at Byrne's drug store are more of a "specimen" nature than milling. The gold is very heavy and permeates the rock, which is of a lively character. Since that discovery work has been prosecuted steadily, and the ore extracted is of high grade. The Pennsylvania adjoins the Empire on the west and is therefore in a good locality. It is owned by the estate of M. Byrne, deceased, and others. A new shaft will be put down directly on the ledge by the lessees. This work will be commenced very shortly. Capt. Hamill is well known as an experienced practical miner, and he is quoted as saying "the mine is worth \$100,000 if it is worth a cent."

**PET GRAVEL MINE.**—At this claim the pumping and hoisting plant will be in readiness by Monday or Tuesday, and in a week hence the shaft will be clear of water and drifting under way. A water-wheel with "Pelton" buckets is in place and will supply motive-power. A reservoir has been constructed on the hill above the shaft and 500 feet of pipe put in place, affording a pressure of 125 feet.

**WILL GET THERE JUST THE SAME.**—Superintendent Mainhart informs us that the water in the Omaha & Lone Jack Consolidated has been lowered to between Stations No. 4 and No. 5—a depth of about 350 feet. The mine is 700 feet deep, and as two heavy 12-inch pumps are to be put in, the "bal" will not be "forked" for about two months. Pelton water wheels run the machinery. A disinterested party who was called to the North Banner mine today, on business, tells us that a cleanup is being made at the mill and that the plates and battery indicate returns equal to if not surpassing expectations. Because of water in the shaft, operations at the Cedar mine have been suspended until April 1st. This mine is at Nickerson's ranch, on Wolf creek below this city, and is being opened up by the Grass Valley Mining and Development Company. We are informed that rock of exceeding richness is being and has been taken out of the breast of the North Star shaft for the past week.

**THE DELHI MINE.**—North San Juan Times, Feb. 11: The Delhi Mining Company are adding to their possessions. They are so well convinced that

they have a meritorious mine that they are purchasing the extensions on the same vein or lode and are procuring patents from the United States Government for such extensions. The Delhi mine is no longer an experiment. Less than two years ago it fell into the hands of Robert McMurray and others and it has now declared its tenth dividend of \$10,000, paid for the construction of a mill of 18 stamps and other machinery, built sulphuret works, paid for the erection of extensive boarding and other houses and has left in the treasury many thousands of dollars. If there is a mine within this State that can make a better showing than this we don't know it.

**ELEVATOR PROCESS.**—We learn that the Milton Mining Company are making arrangements to work their mines at and in the neighborhood of French Corral by the elevator process. They will utilize their long tunnel for the storage of their debris, emptying the debris into the tunnel through the shafts here and there along the line of bedrock.

#### Plumas.

**CRESCENT.**—Greenville Bulletin, Feb. 9: The usual force of men is employed at the Crescent mine. Progress, owing to the hard rock and some trouble in banding the water, is rather slow. There is some talk of the Green Mountain mine resuming operations, but nothing definite seems to be known.

#### San Diego.

**A RICH STRIKE IN BANNER.**—Julian Sentinel, Feb. 10: Joseph Marks showed us a piece of quartz from the Cincinnati Bell, owned by W. L. Frederick of Banner. It came from a vein ranging from three inches to three feet in width, and is the richest average rock we ever saw. The rock is said to discount the Chariot quartz in its palmy days. This is causing considerable excitement among our mining men.

#### Shasta.

**WHISKYTOWN.**—Cor. Shasta Courier, Feb. 11: Whiskytown, which is situated near the confluence of Whisky creek and Clear creek, remains much the same as in days of yore. The Woodwards are there, Kesler is there, John Harrison is there, and many of the old miners still linger near, and among them we should not forget to mention I. W. Zent, a prospector and miner, and who is operating in Eastman gulch. The latter is still at his post of duty, and showed us a piece of gold quartz weighing 7½ ounces, valued at about \$125. It was found in Eastman gulch a few days since. Four years ago a piece of gold quartz was found by the same party in the same place that weighed seven pounds, valued at about \$300. About three years ago the same party found a piece of gold quartz in the same place that weighed 11 ounces, valued at \$130. These several finds have been in a gulch leading square up against a mountain range running toward Know Nothing Gulch, Mad Mule, Banghart and Mad Ox mine. Closing, we would add that the source of Whisky creek, the north of Old Bally, French Gulch and Deadwood are the greatest mining-fields now open to exploration and development in Northern California.

#### Sierra.

**HOWLAND FLAT.**—Mountain Messenger, Feb. 11: Thos. Fant of Howland Flat, where he is interested in drift mines, working at Bunker Hill, came to town Saturday. He reported an average of four feet of snow at that mining camp, frozen to ice. The prospect is good for a fine water season. Bunker Hill Co., 1½ miles this side of Poker Flat, recently put on four extra hands, making, in all, seven men drifting for gravel.

**WIDE AWAKE.**—The Wide Awake drift mine, Alabama Hill, will soon be heard from; the main tunnel is in 700 feet, face now soft bedrock. The channel overhead has dropped 18 inches below the timber caps, showing splendid blue quartz gravel (that prospects well) and large and small quartz boulders.

**BALD MOUNTAIN EXTENSION.**—Supt. Meikle of the Bald Mountain Exchange Co., Forest City, was over on Tuesday, and reported everything in good order and indicative of a prosperous future for this valuable mining property. Sixty men are working and the force will be increased as soon as water is more plentiful. Gold yield for the past week 165 ounces—over \$3000.

#### Placer.

**NEW CHANNEL.**—Placer Republican, Feb. 8: F. Chappellet found a new channel at the Live Oak mine near Forest Hill, about a week ago. It is from 40 to 50 feet higher than the old works, and the gravel contains the same character of coarse gold which was lost in the old channel a few months ago, and it is also full of large quartz boulders. Mr. Chappellet has as yet found only one rim, but the channel is at least from 175 to 200 feet wide, and it has already proved to be at least 7 feet thick with indications that it may be 15 or 20. That it contains considerable gold may be seen with the naked eye, but as it has not yet been prospected, its richness is a matter of conjecture. The miners think this discovery is the making of the Live Oak claim.

#### Trinity.

**A BIG SLIDE.**—Trinity Journal, Feb. 11: During the late storms, Mr. A. Rumlft, who owned a placer mine on Morrison Gulch, about ½ mile from Coffee creek, was spending a few days at Trinity center. On Monday, Jan. 30th, he went to the mine and gathered up all his tools, etc., and 5 o'clock P. M. went into his cabin. While sitting by the fire he heard a rumbling, roaring sound, and everything shook and rattled about the cabin. Just then he glanced out of the window which views the upper portion of the gulch and the whole mountain-side appeared on the move. Frightened and excited, he ran out of the cabin and up on the high ground back of the cabin, when a big palm tree not far from him popped like a pipe-stem, the slide taking the roots downward so quickly that the top fell back. This added to his fright and he lost no time in getting down to Coffee creek. He went to what is known as the Blythe Cabin and spent the night as best he could. Wednesday morning Mr. R., accompanied by three other parties, went to the scene of his recent thrilling experience, where the change in the country made it almost unrecognizable. The slide had started from the Blythe ditch, where it crosses Morrison gulch, and breaking with the ditch for about 200 feet started down the gulch, taking everything before it, cleaning the gulch out completely from the starting-point to Coffee creek, a distance of 1½ miles; not a tree was left standing, for nothing had any

power of resistance before the immense body of earth and snow rushing down like a hurricane. Mr. Rumlft's reservoir, pipe, derrick, water-wheel and a good portion of his claim was taken completely away and buried in the creek ½ mile below. The slide missed the cabin about 20 feet, which is the only thing it did miss. The large trees were broken up into sawlogs as they rode down the gulch, and such a mass of debris as lies in Coffee creek can scarcely be imagined. The creek is entirely turned from its natural course and has formed a new channel. The friction of this terrible mass tore up cement in the bottom of the gulch that would not yield to the pick of the miner. There was about 4 feet of snow at that place and it is supposed that the ditch became blocked and the water ran over or through its banks till the ground became thoroughly saturated, hence the slide. Mr. Rumlft's loss will reach about \$10,000.

#### Tuolumne.

**GOLDEN GATE MINE.**—Sonora Democrat, Feb. 11: We were shown some very rich rock Monday, from the 180-foot level of the above mine. The ore had been roasted and wherever the sulphur, presumably arsenical pyrites, had been, there was a fine showing of gold. In view of the fact that this discovery was made at the greatest depth yet attained, and is an entirely new chute, a new and important future has come to this valuable property.

#### NEVADA.

##### Washoe District.

**SIERRA NEVADA.**—Virginia Enterprise, Feb. 11: The southwest drift from the main north drift on the 520 level, which is now running in a southerly direction, has been extended 40 feet; total length, 1293 feet. It continues in a vein material composed of quartz, clay and porphyry.

**SAVAGE.**—On the 400 level the north drift has been advanced 40 feet, and the south drift 30 feet. Both are in fair grade ore. On the 600 level the south drift has been extended 25 feet, and continues in ore of excellent quality. Are extracting and shipping to the Mexican mill about 140 tons of ore per day from the several levels between the 400 and 600 stations. The improvement mentioned in last week's report on the 900 level continues both in quality and quantity. The bullion shipment for the month of January amounted to \$40,000.

**HALE & NORCROSS.**—On the 400 level the south drift has been advanced 20 feet, and the north drift 18 feet. Have started crosscuts east and west from the face of the south drift. The west crosscut is advanced 12 feet in ore of good quality. The north drift continues in stringers of ore. From the top of the north upraise from the 700 level a drift has been started northwest to connect with the south drift from the Savage mine on the 600. This south drift from the Savage side is out about 50 feet, and the northwest drift from the north upraise is advanced 45 feet. The shipments of bullion for the month of January amounted to \$35,000.

**BEST AND BELCHER.**—On the 425 level west crosscut No. 3 opposite east crosscut No. 3 has been extended 25 feet; total length, 75 feet. This crosscut has passed through 50 feet of good-looking quartz, giving low assay values. The main north drift has been extended 25 feet; total length, 445 feet. The formation is quartz and porphyry. Upraise No. 1, started at a point 130 feet north from the south line, has been carried up 10 feet; total height, 35 feet. This upraise is passing through quartz showing value by assay.

**OCCIDENTAL.**—On the 200 level in the north incline winze, 35 feet above this level, have extended the south drift 10 feet; total length, 28 feet. The ore extracted on this level has been held in the mine. Sixty-five feet below the 200 level a north drift has been advanced 9 feet. In the lower tunnel, 150 feet south of the north incline winze, a south drift has been advanced 12 feet. Extracted 15 tons of ore.

**CROWN POINT.**—There is a fine circulation of air since the 400 and 500 levels were connected by the completion of the raise from the latter. Good headway is making in the crosscut started on the Belcher line, and also in that started last Tuesday opposite the west crosscut. Both these crosscuts are on the 400 level. Good headway is being made in the south drift on the 400 level. It is being advanced in a favorable formation.

**GOULD AND CURRY.**—On the 250 and 300 levels are still prospecting for ore. Have extracted about 250 tons in the past week of fair-grade milling ore, making a total of 300 tons now in the ore-house. On the 1300 level the south drift from the east drift has been extended 37 feet; total length, 270 feet. The formation is clay, porphyry and streaks of quartz.

**CON. CAL. & VIRGINIA.**—Ore of high grade is being stoped out at the bottom of the winze sunk below west crosscut No. 2 on the 1435 level. The usual prospecting work is being done on the 1300, 1600 and 1650 levels. The usual amount of ore has been sent to the mills on the Carson river, and the battery assays will average about the same as last week.

**BELCHER.**—On the 400 level the crosscut is in a distance of 47 feet, the face showing material of a favorable character. The south drift on the 500 level is out 151 feet. The material is principally quartz, clay and porphyry. There is some water coming in. Good headway is making in the drift to connect with the Suto tunnel.

**CHOLLAR AND POTOSI.**—Are prospecting promising ground at several points, and in places are obtaining some metal-bearing quartz. The ore-producing sections continue to look well, and are yielding as usual. The mill is kept running, and the ore worked is yielding well under the Logan process.

**MEXICAN.**—No. 2 crosscut west from the main north drift on the 1300 level, 100 feet south of the north line, is out a distance of 232 feet. The face continues in soft porphyry in which clay slips are frequently encountered.

**YELLOW JACKET.**—The daily shipments to river mills amount to 350 tons. The ore development near the Confidence line continues to show improvement. Since putting in a blower the air on the 1100 level has been good.

**JUSTICE.**—Good progress is being made in the raise which is to connect the 340 and 490 levels. Other prospecting operations are going ahead as

usual. There are on the dump over 1500 tons of good milling ore.

**UTAH.**—On the 472 level west crosscut No. 2, 400 feet north of the main west drift, have started an incline upraise. This upraise has been started in a favorable-looking quartz and porphyry formation.

**UNION CON.**—No. 1 west crosscut, 100 feet north of the south line on the 1200 level, has been advanced 20 feet; total length, 45 feet. It is in vein porphyry of a favorable appearance.

**ANDES.**—A good deal of prospecting is being done at points above the 400 level, and in one or two places promising streaks and bunches of ore have been encountered.

**ALPHA, IMPERIAL AND EXCHEQUER.**—The drifts on the 382 level continue in promising material, with streaks and bunches of good ore in places.

**ALTA.**—The usual work is being done on the ore-producing levels, but the mill has not yet been started up, owing to the bad condition of the roads.

**BENTON.**—The drifts on the 725 level are being pushed ahead as usual. The formation promises well, the ground showing indications of fertility.

**SEGREGATED BELCHER.**—On the 1300 level the drift south from the upraise is out 126 feet. The material is vein porphyry of a fertile appearance.

**OPHIR.**—The upraise from the 1465 level continues in the quartz formation encountered last week, and the assays obtained are promising.

**BULLION.**—A working station is being excavated at the 500 level, from which prospecting drifts will be sent out.

**ALPHA.**—Some streaks and bunches of ore are being found in the east drift on the 382 level.

**SCORPION.**—Are still drifting north and south along the vein on the 300 level.

#### Columbus District.

**MINES AND MILLS.**—Esmeralda *News*, Feb. 12: However dull it may be in other parts of the State, Candelaria can always be relied on as a bullion-producing town. The dawn of the discovery of the mines thereabouts was one of promise, and for years has the old camp held front rank among paying mines. The probabilities for an everlasting continuance of this record are brighter than ever. There have been better times there than at present, but the developments made during the last year have created a confidence in the merit of the mines encircling that most hospitable town. The Mount Diablo mine is an unlimited source of wealth to its owners; but from the grass-roots down to the lowest depth of its present works "it has paid big." There has been no end to the vein and its exact width is not now definitely ascertained. With its present facilities for handling and reducing the ore produced, it is certain that the day of its shut-down will never come. It would have been better for the people and for the company to have erected its reduction works at the lower end of the town instead of at Sodaville, and no doubt the company will at some future day conclude to establish works in closer proximity to its mine. It has over 100 men on its pay-roll and they are promptly paid. There is the Holmes lying idle and without excuse, except that silver is at such discount that its already wealthy owners would rather the ore containing the precious metal should remain in the ground—nature's vault—than be compelled to dispose of it at such an outrageous discount. The Holmes is not one mine, but is the name of a series of at least a dozen mines each of which was a dividend-producer. The Georgene series, whose ore dumps and hoisting works are the first to attract the notice of those visiting the town, is owned by an English syndicate. The efficient management of those mines has helped to build up the confidence that mining men have in the mines of that district. The Victor and Georgene with parallels and extensions form the Georgene group and is owned by the Candelaria Water Works and Milling Co. In addition to its mines, the company has one of the finest and best equipped 30-stamp mills on the coast, and though temporarily closed for needed repair it will be started within a few days, when the steam whistles of mines and mill will be sounded in chorus. There is a large quantity of ore at the mill waiting to be pulverized, and there is an abundance in sight to keep the mill at work to its utmost capacity. The Georgene company has done a great deal for Candelaria, and it is extending its reputation for good throughout the county by its liberal terms to small mine-owners for reducing ore. There are many other mines—the Lucky Hill, Chief of the Hill, Potosi and others equally as valuable as the Diablo, Holmes or Georgene, and they will command attention and be worked as they should. There will be a revival in mining throughout this State this summer, and with such showing as the mines in Candelaria have and can make, there is every reason for increased activity in and about the camp.

#### Eureka District.

**ORE SHIPMENTS.**—*Sentinel*, Feb. 8: During the past week ore shipments were made from the mines of the district as follows: To the Richmond Co.—Dunderberg mine, 18 tons; Jackson mine, 22 tons. Eureka Con.—David Lindsey, 14 tons; Oriental and Belmont, 32 tons.

#### Seligman District.

**IMPROVING.**—*Carson Tribune*, Feb. 11: The mines in Seligman district, White Pine county, show steady improvement, and Manager Robinson is pushing things for all they are worth. He is putting up the largest concentrating-mill on the coast; in all its details one of the most thorough and complete of its kind, which will have a capacity of 100 tons. There is no lack of ore. The ledge is 6000 feet long and varies in width from 4 to 40 feet, with the grade of ore improving as depth is attained. Seligman now gives promise of being the big camp of the country.

#### ARIZONA.

**HOWARD.**—*Prescott Courier*, Feb. 11: The Howard mine, Hassayampa district, continues to produce very rich gold-bearing rock. D. W. Clearwaters was in the mine yesterday; the bottom of the shaft is about 40 feet below the surface; in it free gold is everywhere to be seen in the vein. They had 33 sacks filled with the richest rock. Work in the tunnel was progressing. Mr. Turner of Big Bug district is in town. He met Mr. Cartmell on the trail. He was going to fix the Schofield mill. A. D. Whitney of Walker district, brought in about

a ton and a half of ore for Moore & Doggett. They have 40 or 50 tons of rich ore ready to be hauled, and are every day taking out more. It was rumored here yesterday that the Standard mill will start on its first run this morning. Chances are that 9, maybe 10, mills will be running in this section next summer.

**STRIKE.**—*Clifton Clarion*, Feb. 10: An important strike was made the past week in John H. Hovey's Coon mine on Chase creek. The owners have for some time been engaged in running a tunnel between two ledges on the claim, with the intention of crosscutting at 100 feet. The proposition has met with flattering success, and after running the tunnel the above distance the crosscut in one direction has cut a splendid ledge of ore which shows free gold of the same character as that which was obtained from the croppings and which caused such excitement when displayed about town. The owners are now in three feet on this ledge and are not yet through it. This tunnel gives to the workings where the strike was made a depth of about 80 feet from the surface. As soon as the full width of this ledge is arrived at the crosscut will be driven in the other direction for the purpose of cutting the other ledge.

**ORE.**—About 15 tons of ore from the Wonderful claim of the Friend Bros. were shipped the present week to the Rio Grande Smelting Works at Socorro, N. M. Yesterday morning 50 sacks of ore from McCarty's Lucky Jim mine at Gray's peak were shipped to El Paso.

**BIG BUG DISTRICT.**—*Prescott Courier*, Feb. 12: Douglas Gray of Big Bug district is here feeling as if bonanzas in his camp "speak for themselves," which they do. We hear that John S. Jones wants to purchase ore on dumps for his Standard mill. W. W. Davis and Dan Hatz of Slate creek have a carload of rich ore ready to ship. Jos. Campbell told us yesterday that he will shortly commence packing 400 tons of ore from Hassayampa district to the Standard mill, Groom creek. E. M. Clark yesterday purchased the Queen Company's property, Groom creek district, for his brother, Mr. Raymond, just from same district, reports deep snow in the mountains. He was told that Moore & Doggett had \$30,000 worth of ore in sight in their mine. Talk is that Bigelow & Smith have very rich gold rock in their mine. Rock said to be as rich as that of the Howard.

**TOMBSTONE NOTES.**—*Epitaph*, Feb. 11: The seventh level (just above water) has been started in the Emerald mine, one of the principal properties of the Grand Central Co. The ore produced is somewhat higher grade than in the upper levels, and the condition of the mine was never so good. At water level in the Boss, another Grand Central producer, a body of very high-grade ore was found to continue below, but further developments in that direction must await the resumption of pumping operations. Sufficient ore is being produced from the various properties of the Grand Central Co. to keep 20 stamps continually pounding away. Developments in the different levels and stopes of the Old Guard are very encouraging, and furnish more than sufficient ore to keep the mill constantly at work. Recent developments in the Lucky Cuss, which mine is likely to bring the T. M. & M. Co. out all right, have been of a very important character. It is said that at 300 feet, a magnificent body of high-grade ore has been encountered, the size of which has not been ascertained. The Telephone mine, owned by J. Murray Bailey, some three months ago was leased to Messrs. Hughes and others for a term of 12 months. Recently they developed an extensive body of high-grade manganese ore, which they are shipping to Socorro at a good profit.

#### COLORADO.

**KEYSTONE.**—*Elk Mountain Pilot*, Feb. 9: The Keystone mine just above town, near the Iron Swamp, is attracting some attention. This claim was located several years ago by Mr. Williamson. The main vein is several feet in width and a large quantity of ore has been encountered within the last few feet. This ore is as yet quite refractory, as it has a large amount of zinc blende and iron pyrites mixed with the galena and copper pyrites. It is not unlikely this zinc and iron will disappear as the work advances and probably be replaced by the galena coming in solid. The recent big strike in the Bonny Belle mine at grass roots in Aspen is another proof that deep mining is not always necessary to secure rich ore in Colorado. It should also be an incentive to prospectors for a more thorough and careful examination of the mineral outcrops and surface exposures in the mining sections. The force on the Daisy in Redwell will soon be increased and ore shipment possible. The Anthracite Mesa coal mine has nearly doubled its output since the completion of the mine tramway by which the loaded cars are let down the incline of the main entry, and the empties going up at the same time. The expense of mules and drivers is dispensed with, while the hauling capacity is greatly increased.

#### DAKOTA.

**ELK MOUNTAIN.**—*Deadwood Pioneer*, Feb. 8: Superintendent Barry of the Elk Mountain paid a business visit to the metropolis on Tuesday, and says that work progresses favorably. The company has already shipped one carload of ore to the Omaha reduction works, from which, however, returns have not as yet been received. The force employed is working on ore now, and extracting a considerable amount for each shift worked. Tuesday, the first installment, about 2 tons, toward the second carload left the mine on wagons for Sturgis City and the railroad. The average value of the ore is about \$60 per ton.

**PLANET.**—Good reports from the mine are received. The ore body encountered some days ago continues to enlarge as work progresses. Pay prospects from any portion of the vein show that the gold is equally distributed throughout the entire ledge. The mine will be thoroughly opened in the spring. A number of wagons laden with coke for the Iron Hill smelting works passed through the city Tuesday.

#### IDAHO.

**THE WAR DANCE GROUP.**—*Inter-Idaho*, Feb. 8: Edward Flannery is down from Deer creek with a

12 tons shipment of fine ore. He and Jas. W. Burns are equal owners in the War Dance group of mines, which are located about 8 miles from Hailey, and a mile from Bolton's hot springs. The War Dance, which is the best developed mine of the group, has 3 tunnels. Nine men are employed on it this winter. The middle tunnel has an ore chute 240 feet long, going both up and down. The owners are drifting both ways and still have ore in the headings of both drifts. The ledge is from two to four feet wide and will average from 100 to 135 ounces in silver, and from 70 to 75 per cent in lead. Some choice specimens of gray copper go as high as 3000 ounces. Very little stoping has been done, most of the ore having been taken out of the drifts. When the roads are opened so that timbers can be hauled, stoping will be commenced. The lower tunnel is in 60 feet. It is expected to cut the ledge in about two months. The ore grows richer in depth. In the lower tunnel considerable gray copper and sulphurates have been found. Some of it looks almost like bullion and assays as high as 2860 ounces in silver. The upper tunnel has been driven in 400 feet, 300 feet being on the ledge. Considerable ore is showing up in it. The Emery mine, which joins the War Dance on the northwest, has a tunnel 450 or 500 feet in length, with several upraises to the surface. It contains two big chutes, 150 feet long; one being 3½ feet thick, the other 4 feet and two inches. There is plenty of ore in the bottom of the drift, but, instead of working it from above, it is intended to work it through the War Dance tunnel from below.

**ABOUT THE MINES.**—*Bellevue Herald*, Feb. 9: With to-night's shifts all the old forces will be at work in the Minnie Moore, Relief and Queen of the Hills, or as near as they can be arrived at. In all, between 180 and 200 miners and mill men will tomorrow be on the pay-rolls, and from the way that the managers speak, ore will soon be hoisted as never before from the great Galena-gulch mines one mile west of Bellevue.

**CAMAS NO. 2 RUMOR.**—In Bellevue the rumor has gained circulation that the Camas No. 2 gold-belt mine had been sold to a company made up of the "Bonanza Kings," the price of the sale being \$500,000, three-fifths cash. The rumor also states that work may be looked to in a gigantic way, but what truth there is in the matter we are unable to say. To have such operators as Fair, Mackay, Stewart, or men of their reputation take hold of the gold belt it would be a boom for this entire section.

#### MONTANA.

**ARGENTA MINES.**—*Inter-Mountain*, Feb. 7: News from the Argenta mining district indicates that the coming spring will see quite an old-time boom, and from the finds that are taking place there and the developments that are being quietly pushed forward on certain claims, it seems more than probable the miners in this once prosperous district will be rewarded liberally for the determination, pluck, and energy displayed. Two claims owned by A. V. Clark and some parties in Butte are properties of valuable promise. A good strike was made in the Eureka last week of galena, which carries 98 ounces of silver and 70 ounces of lead, and there is every indication that future developments will disclose some still higher grade ores.

**RUNNING WOLF.**—*Cor. Butte Miner*, Feb. 11: In looking up a railroad route from Great Falls to Neilant it came to my knowledge that a new mining camp, called Running Wolf mining district, Fergus county, about 13 miles from Stanford, is coming to the front. There are several claims patented in the district, two of them the Mystery and Sir Walter Scott lodes by Paris Gibson. I am told there will be extensive mining operations in the new camp next summer. The leads run from 3 to 30 feet in width, and are rich in silver and copper. There is abundance of timber and water in the vicinity. Several large bodies of coal have been struck, and there is unlimited iron ore in the district.

**SHUT DOWN.**—*Butte Miner*, Feb. 8: The Hope mine shut down yesterday and all hands were discharged except two, who will keep the pumps running. The cause of the close-down is that the mine is mismanaged by parties in the East. Nothing has been done in the mine except by direction from the East, and the directions were in general just the contrary of what would have been given if the foreman if he had been permitted to work the mine according to his own judgment, which would have brought out the best results. Whenever a body of ore has been struck in the mine the whole force has been concentrated upon it and all development work suspended. The consequence was that when the bunch of ore was worked out the mine was practically valueless, for there was no development or prospecting for other ore bodies. As it stands now the western part of the claim is almost unprospected, and no one can tell whether it is working or not. A gentleman from Deer Lodge informs the *Miner* that the new steam hoisting works on the Champion Consolidated Company's mine Lily are now complete and ready for business, with a capacity to sink 600 feet. A contract has been made with a Mr. Doyle of this city to sink the first 100 feet. He believes the mine will soon be counted among the prominent producers. The Mountain Lion tunnel was completed a couple of days ago, striking a body of rich ore, of which an assay returned 731½ ounces of silver. The owners of the property are naturally very jubilant.

#### NEW MEXICO.

**GOLD HILL.**—*Cor. Silver City Enterprise*, Feb. 10: While the district is not booming it is progressing in a slow but sure way, and all who have worked their claims intelligently have a good prospect of being rewarded for their labor. The Yankee Girl, which has yielded a large amount of ore, and is being worked with marked success, has developed into a mine. Farther west and bordering on the same dyke of porphyry, Kellum & West have sunk a shaft 60 feet deep on the Minneapolis, and are now grading a road to ship ore, which contains sulphides richly intermixed with native silver. Andy Sawyer discovered last week a blind lead of very rich gold rock. Gray sent a lot of ore to Mr. Knott's arastra east of here and secured \$60 per ton in gold, which has induced him to erect an arastra of his own. Mr. Utter is working six men. He will start his mill again soon, as he will have plenty of water. McDowry is sacking ore for another shipment. He expects to realize from \$125 to \$175 per ton. A cus-

tom mill is what we now need most. It could make money and give the miners means to develop their properties, and at the same time be a source of revenue to the county at large.

**SOCORRO.**—*Bullion*, Feb. 11: The Socorro mountain excitement still continues and a number of prospectors are searching for the hidden treasure. Day and Green brought some fine-looking specimens to the city this week, and, to all appearances, these gentlemen have struck a good and lasting body of mineral. L. L. Howison was also showing some good rock, and it is the general impression that our old mountain will yet prove to be of great value. Col. Eaton made another shipment of ore from his Magdalena mines to the Graphic this week. Another lot of rich ore was brought in, a few days ago, from the Comromise, located at Hansonburg and owned by Blanchard and Reynolds. This property is now down about 65 feet and grows richer every foot. We are informed by one of the parties interested in the Torrence that it is the intention of the owners of this mine to begin sinking a shaft shortly. The recent strikes further up the mountain have created confidence in the Torrence. A force of men will soon be put on the old Boss mine, located in the Galinas. This property, which is owned by Catron & Wilson of Santa Fe, is one of the richest in the country. It is said that \$42,000 worth of ore is now on the dump ready for shipment.

#### OREGON.

**PLACER AND QUARTZ.**—*Jacksonville Times*, Feb. 11: Some gold-dust is being brought to town. Miners are still very busy, but are not at all pleased with the present beautiful weather. O'Brien & Berryman of Applegate have their hydraulic in operation, and will make a good run. The miners of Josephine county have an abundant supply of water, and most of them will do well this season. John Atteberry and J. D. Matney of Forest creek are moving considerable ground, and have good prospects. J. T. Layton of Applegate is getting ready for the season's run, and will commence operations in a few days. Some of the miners are ready for more rain, as the warm weather during the day, and the heavy frost at night, have already lessened the supply of water. A shaft 75 feet deep has already been sunk on the Eureka mine, owned by J. S. Urquhart of Gold Hill. Coulter & Son are also forwarding work on their tunnels. Although the season for such things is rather early, much prospecting is going on in the vicinity of Gold Hill. This is destined to be an important mining camp in the near future. Salmarsch, Yaudes & Co. have sold their mines in Sterlingville precinct, which are known to be rich, to Henry E. Ankeny of Marion county, son of Capt. A. P. Ankeny. Consideration, \$20,000. Coulter & Son's quartz-mill, which laid idle during the cold spell of weather, has been running on full time during the past fortnight, and doing good work. There is a large amount of good quartz still on the dump.

**MINERAL CITY.**—*Cor. Badrock Democrat*, Feb. 8: There is nothing doing here at present. Only about ten or twelve men in camp. There have been no sales made yet and we do not think there will be soon, as none of the experts that have been in here have had any capital to operate with. They come in here with a business-like air, and one would think they intended to buy out the whole camp; but when you come to find them out they haven't got one dollar of their own, and are only trying to catch on to other people's property and make a few dollars. They always fail and that keeps our camp back. Mining claims are very cheap here, and if the right man would happen along with money, who meant business, he could buy out the camp cheap by paying cash down. We are all tired of the bonding business, for it never amounts to anything. The snow is about a foot deep on an average and is melting off fast. I think stock would do better in this part of the country than the miners; for none of the miners in this camp have ever made any money since they came here, and I am one of the number.

#### UTAH.

**OPHIR.**—*Salt Lake Tribune*, Feb. 10: The Gem mine, Ophir, is employing 12 men in extracting a little ore and in making a connection between two levels that are 540 feet apart, of which 400 feet has been completed, and the connection is expected to be made within the next 30 days. This will open up the mine in good shape to a depth of about 800 feet. This connection is made by following down on the ore chute, which is from two to five feet wide, carrying ore running from 40 to 500 ounces silver and but little lead. The Brimm Bros. are preparing to make extensive shipments from their property on Lion Hill, Ophir. The Honerine tunnel, Stockton, is being pushed ahead rapidly since starting the new machinery, which works very satisfactorily.

**THE DIAMOND QUARRIES.**—*Salt Lake Tribune*, Feb. 4: The Diamond, Beaver & Castle Stone Co. is making preparation for extensive operations this year. They own quarries at Diamond, near Thistle, on the D. & R. G. R., where there is an immense quantity of brown stone like that in the Cullen hotel front, another quarry at Kyune, four miles east of Pleasant Valley junction, producing a gray sandstone, and another at Castle Gate, that has various thicknesses or layers of fine, hard, drab stone suitable for building, flagging, etc. They own 40 acres at each place, have in side tracks, derricks, etc., and are now arranging to put in steam drills to expedite work. It was only last year that these quarries were opened by Lawrence & Hammill, the owners, and yet they have shipped a large amount from each of the three places. An order of 60 carloads for Denver from the Kyune quarry is about filled. Last year they sent out over 200 carloads to points in Utah and Colorado, with a few carloads going to Kansas. The prospect for a big business this year brightens with the many inquiries they are receiving, and the assurance of extensive building operations in this city at no distant day.

**A HUGE COAL VEIN.**—The Sunnyside coalmen have penetrated 51 feet in one vein, where they find coal which they claim beats any coal hitherto produced in the West.

**THE ASPHALTUM WORKS.**—*Provo American*, Feb. 3: Mr. Le Sieur has received notice from his St. Louis Co. that the bids for the construction of the building for the asphaltum works at Tishie have been awarded to Mr. O. H. Berg. Mr. Berg will begin operations at once.

**ATTENTION, GOLD MINERS!**  
WE ARE SELLING  
**Silver-Plated Amalgamating Plates**  
**For Saving Gold in QUARTZ, GRAVEL and PLACER MINING,**

At reduced rates. Get our prices. Three thousand orders filled. Fifteen medals awarded. Our plates have proved the best, and far superior to others in weight of silver and durability. Old mining plates replated. These plates can also be purchased of **JOHN TAYLOR & CO.,** cor. First and Mission Sts.

**SAN FRANCISCO GOLD, SILVER and NICKEL PLATING WORKS,**  
**E. G. DENNISTON, Proprietor.** 653 & 655 Mission St., San Francisco, Cal

NOTICE.—Mining men are cautioned against fraud in purchasing poor mining plates made in this city; they have proved defective in the Silver-plating, and in having much less Silver than was contracted for. When in doubt make an assay; thin, light Silver-plating looks the same as heavy. **SEND FOR CIRCULAR.**

—THE—  
**DOUBLE "ECONOMIC" STAMP MILL.**

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

**AN AUTOMATIC ORE FEEDER**

Goes with each Mill. We also have a suitable

**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to SUPERSEDE THE OLD STAMP IN MILLS OF THE LARGEST CAPACITY.

C. A. STETEFELDT, President.

NEW YORK OFFICE, 18 BROADWAY  
Room 709.

The Late A. J. Stevens.

In the death last week of A. J. Stevens, who has been for many years master mechanic of the Southern Pacific Co., the community and the company lose a most useful and talented man. He has been connected with railroads in various capacities nearly all his life, and had finally attained a position of great responsibility and prominence. He had charge of the great railroad-shops at Sacramento, and it was due to him that they grew to the present magnitude. He convinced the railroad management that it was possible for the company to build their own locomotives, with the result of giving employment on this coast to thousands of skilled mechanics.

The large engines used on the Oakland local tracks were of his design, and he also designed the Governor, the heaviest locomotive in the world, which is used at Tehachapi. Mr. Stevens also planned the machinery for the large ferry-boats Piedmont and Solano. He perfected many inventions for which he obtained patents. Among these the valve motion for engines now used on the locomotives of the S. P. Co.; the apparatus for burning crude petroleum, in use on the ferry steamers; a boiler, a feed-water purifier and others. Aside from his patented inventions he introduced many improvements and made many experiments for the more practical working of the mechanical departments over which he presided.

Mr. Stevens, as may be seen from what has been said, was a talented and skilled mechanic and an ingenious inventor. He was very practical in everything, and was highly respected by his men. On the day of his funeral the railroad shops at Sacramento were closed, and upward of 1500 mechanics escorted the remains to the church. The interment was at Oakland on the following day. The floral designs were numerous and varied, many of them being of very original design. The employees of the machine-shop sent a floral representation of Engine 48, that being the locomotive in which Mr. Stevens' patent valve motion was first applied. The floral representation of a sleeping-car from the car department was an elaborate design. A hoiler, five feet in length and standing five feet high, was the floral offering of the employees of the hoiler-shop. The fire-hox was of variegated pantries and the hoiler of blue violets. Over the hoiler were the letters, "A. J. S.," worked in violets, and beneath, the words "Our Tribute." A large broken driving-wheel was the offering of the foundrymen. A large-floral representation of the steamer Modoc was an offering from the Oakland employees of the Southern Pacific railroad. It was three feet long and about four feet high. A large floral steam hammer was the offering of the employees of the blacksmith-shop, while that of the machine-shop was a mammoth and magnificent floral representation of the ferry steamer Piedmont. The blacksmith-shop also sent a floral anvil and hammer. At the head of the casket and resting on the floor was an elegant floral offering, representing the gates ajar. This, as also the beautiful broken column at the opposite end of the casket, was sent by E. C. Fellows Lodge, Brotherhood of Locomotive Engineers. A hesutiful design, representing the badge of the Order, was contributed by the Brotherhood of Locomotive Engineers. A number of other designs were sent by individual friends of deceased.

New Incorporations.

The following companies have been incorporated, and papers filed in the office of the Superior Court, Department 10, San Francisco: PUTAH CREEK COAL, IRON AND MANGANESE Co., Feb. 14. Object, to locate, buy, sell develop and improve coal, iron, manganese and other mines, and in order to do so, also to operate all kinds of roads, vessels, steamers, and colliers. Capital stock, \$1,500,000. Directors—Thomas K. Davidson, W. C. Curtis, Joseph Craig, Frank Shay and B. F. Tuttle. SNOW MINING AND DITCH Co., Feb. 14. Location, Iowa/ile district, El Dorado Co. Capital stock, \$500,000. Directors—John Landers, Hermann Zidig, S. P. Middleton, Alex. D. Sharon and T. J. L. Smiley.

Mining Share Market.

There is no great range of fluctuations in prices of stocks in these days, and not very much interest in the market. Nevertheless, the ore-producing sections of all the leading Comstock mines are looking well, and there is more ore already out and awaiting milling than at any one time in the past ten years.

The Enterprise says that there will be no falling off in the amount of Con. Cal. and Virginia ores reduced, and no passing of dividends. The California pan and stamp mills will be shut down for four or five weeks during the necessary alterations in the apparatus for the transmission of power, but it is better to make the required alterations at once than to attempt to run with the old cables and gear, the liability to frequent stoppages being considered. W. R. Eckert, an old-time Comstocker, and one of the most reliable and accomplished machinists and engineers on the Pacific Coast, will at once proceed to solve the problem as regards the proper form and position of the pulleys to be used with the new cables. The middle mines

are extracting all the ore that can be reduced, and at the same time are making valuable new developments. The Gould and Curry is again becoming an ore producer, and already has on hand a considerable amount of ore that will be worked as soon as milling facilities are obtainable.

List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey & Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey & Co.'s Patent Office Library, 220 Market St., S. F.

FOR WEEK ENDING FEBRUARY 7, 1888.

- 377,553.—ELECTRIC GAS LIGHTER.—Julius Finck, S. F.
- 377,584.—STATION INDICATOR.—E. S. Irvin, Berkeley, Cal.
- 377,593.—BRIDLE WINKER ATTACHMENT.—E. B. Knapp, San Jacinto, Cal.
- 377,525.—SEWING MACHINE.—M. Lachman, S. F.
- 377,527.—CABLE RAILWAY GRIP.—D. S. Mackey, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect security, at reasonable rates and in the shortest possible time.

Notices of Recent Patents.

Among the patents recently obtained through Dewey & Co.'s SCIENTIFIC PRESS U. S. and Foreign Patent Agency, the following are worthy of special mention:

SEWING MACHINE.—Morris Lachman, S. F., assignor to Commercial Oversewing Machine & Manufacturing Co. No. 377,525. Dated Feb. 7, 1888. This invention relates to certain improvements in sewing machines, and comprises a mechanism which is intended to form a stitch to be used in making grain and other bags. It consists in the combination, with a vertically moving needle, of a peculiarly shaped semi-rotating or oscillating looper, an arm or finger to hold the thread upon the looper and a mechanism by which these parts are actuated.

CABLE RAILWAY GRIP.—David S. Mackey, S. F. No. 377,527. Dated Feb. 7, 1888. This improvement in cable grips consists in such a construction of the lower movable jaw of the grip, in connection with an adjustably-moving fulcrum and the sliding-plate to which the jaw is hinged, that it may be thrown down and swung entirely out of the way of the rope in case of obstruction or accident, and it may be brought up in such a manner as to seize the rope whenever desired. By the construction patented the rope may be dropped at any time and picked up easily, as the sweep of the lower jaw in closing will always take hold of the rope and bring it to its proper position between the two.

CAN-CRIMPER AND CAPPER.—Mathias Jensen, Astoria, Oregon, assignor of one-half to Jensen Can-Filling Machine Co. of same place. No. 376,804. Dated Jan. 24, 1888. This apparatus is specially intended to receive cans which have been filled with fish or other material, and by means of a belt and a feeder or carrier to transfer them to a point where they receive a cap, and afterward transfer them still farther to a crimper, by which the caps are crimped in place upon the can, the latter being discharged after the completion of the operation, and delivered into a conveyer which carries them to the machine for applying the acid to solder the covers upon them.

ELECTRIC GAS LIGHTER.—Julius Finck, S. F. No. 377,553. Dated Feb. 7, 1888. The invention relates to that class of electric gas-lighting apparatus in which the magnet and connected parts and the circuit-breaker and its contact point by which the spark is effected, are all placed in close proximity to the burner usually surrounding it and practically, if not actually, formed with it; and the object of the invention is to provide an apparatus of this class which, by reason of its construction, may be readily applied to any form of gas-burner, requiring no special previous construction to adapt it to this end. The invention consists in a frame which carries the magnet, the circuit-breaker, and all the customary parts of such apparatus, said frame having a means—such as an arm projecting from its top end formed with a collar which fits over the burner—for readily attaching the apparatus to the burner, the frame being placed in such a position that its sparking devices shall be in proper relation to the end or tip of the burner.

THE ADAMANTINE SHOES AND DIES (see advertisement next page this number) are manufactured by Chrome Steel Works, Brooklyn, N. Y.; H. D. Morris, 18 Fremont St., this city, agent. These shoes and dies are now largely used by stamp-mills throughout the coast with most satisfactory results, the metal from which they are made, chrome steel, being peculiarly adapted to such work. It is both hard and strong, and the castings made from it are entirely free from blow-boles, being as perfect in this respect as the best iron castings. In consequence of this they wear evenly throughout their use, and are very durable. As regards durability, they are guaranteed to equal three sets of cast iron. Orders, subject to above guarantee, are respectfully solicited.

MINING SHAREHOLDERS' DIRECTORY.

COMPILED EVERY THURSDAY FROM ADVERTISEMENTS IN MINING AND SCIENTIFIC PRESS AND OTHER S. F. JOURNALS.

LEAD—Quiet at \$4.70 @ 4.76 spot. Transferable Notices issued at \$5.00. TIN—Dull at \$38.00 @ 37.00. Transferable notices issued at \$34.00. MAKERS' PRICES—At tide water. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.50 @ 20.00; Grey Forge, \$17.00 @ 17.50; Hudson River, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.00 @ 20.00; Grey Forge, \$17.50 @ 18.00; Southern, Grade No. 1, \$20.00 @ 21.00. No. 2, \$18.50 @ —; Grey Forge, \$17.00 @ —. Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$37.00 @ 37.50; Billiton Tin, \$37.00 @ 37.50; Banca Tin, \$38.00 @ —; Baltimore Copper, \$14.75 @ 15.25; Orford Copper, \$15.50 @ 16.00; P. S. C. Copper, — @ —; Foreign Lead, \$5.40 @ 5.50; Foreign Spelter, \$6.10 @ 6.30. Antimony, \$11.50 @ 12.00.

Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports: SAVAGE (for January), \$40,000; Hale and Norcross (for January), \$35,000; Standard, Feb. 14, \$15,705; Con. Cal. and Virginia, 12, \$153,915; Lexington, 10, \$23,608; Blinbird, 10, \$16,352; Hananer, 7, \$2000; Germania, 7, \$3089; Germania, 9, \$1650; Hanauer, 9, \$3950; Queen of the Hills, 9, \$1000; Pascoe, 9, \$1270; Hananer, 10, \$2000; Germania, 11, \$3475; Hanauer, 11, \$1005; Crescent, 12, \$3700; Hanauer, 12, \$2200. The shipments of base bullion and ore from Salt Lake, for the week ending Feb. 12th, were 21 cars bullion, 509,620 lbs.; 29 cars silver and lead ores, 880,530 lbs.; 4 cars copper ore, 113,400 lbs.; 1 car matte, 37,500; total, 1,541,050 lbs.

Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by sending Agents in their labors of encouraging and aiding their friends and encouraging favors. We intend to send none but worthy men. F. B. LOGAN—Santa Clara Co. JOHN G. H. LAMPADUS—Monterey Co. G. W. INOUE—Arizona Territory. WM. WILKINSON—Stanislaus and Merced Co.'s. A. F. JEWETT—Tulare Co. C. E. WILLIAMS—Yuba and Butte Co.'s. R. G. HUSTON—Montana Territory.

WORKING ORE.—Miners who want a quartz-mill, large or small, at one-eighth the cost of stamps, should investigate the new Stiles pulverizer and concentrator, both fully tested, and which are going to get to the front and stay there. Address J. A. Johnson, 105 Stockton St., San Francisco.

## About Obtaining Patents.

### Patents are Virtually Contracts.

The Patent Law provides that in case a patent, which is the evidence of the contract, is not executed in compliance with the requirements of the law, it may be annulled and rendered void. Hence, it is of the greatest importance to every inventor that his patent or contract be skillfully and accurately drafted, in order that it may afford him complete protection for his invention during the life of his patent.

### Secure a Good Patent.

An inventor should first ascertain whether or not his improvement has been patented to another. This requires an exhaustive search among all the patents in the class to which the invention relates. If, by this "preliminary examination," the improvement is found to have been previously patented, our client will receive, for the small sum of \$5 for the examination, a verbal or written report showing definitely wherein his invention has been anticipated, thereby saving him further expense and perhaps much time, anxiety, etc.

To avoid all needless delay, however, and secure patents at the earliest moment practicable, inventors will do well to forward a model, drawing or sketch, with a plain, full and comprehensive description of their invention (stating distinctly what the particular points of improvement are), with \$15 as a first installment of fees. If the improvement appears to us to be novel and patentable, the necessary papers for an application for a patent will be prepared immediately and forwarded to the inventor for his signature. When he receives the application and finds it duly prepared, he will carefully sign and return the same plainly addressed to us, with postal money order or express receipt for our own fee. The case will then be promptly filed by us in the Patent Office, and vigorously prosecuted to secure the best patent possible. [This course is the most expeditious and satisfactory, as no time is lost in transmitting correspondence relative to the preliminary steps.] When the patent is allowed the inventor will be duly notified, and on sending the final Government fee of \$20 to us, we will order the issue of the patent, and forward the same as soon as it is secured from the Patent Office.

The payments are thus divided and made easy. We make no pretense of doing cheap work, in order to entice custom, nor do we afterward make additional charges to bring the bill up to a fair compensation. We do our work honestly and thoroughly, and we never give up a case so long as there is a chance of obtaining a patent. The Agency charge, including drawings, rarely exceeds \$40, and for this we do all we can without appealing the case.

### Models and Drawings.

Models are now seldom required by the Commissioner of Patents, and generally only in intricate cases. Perfect drawings of practical working machines are more satisfactory to the Patent Office than the old cumbersome system of storing up an immense bulk of countless models.

Drawings or sketches, sufficient to illustrate the invention clearly, with a description that will enable us to make a full set of perfect drawings for the Patent Office, is all that we require. A model will answer our purpose as well, however, in cases where the inventor can more easily furnish it. The value and even the validity of a patent often depends on the character, clearness and sufficiency of its drawings. There are thousands of existing patents in which the improvements are but partially or poorly illustrated in the drawings. When an attempt is made to dispose of such patents, the vagueness and defects of the drawings often a prejudice capitalists and manufacturers against the invention, while in reality it may be of great value, and would meet with ready sale had it been skillfully, completely and artistically portrayed. In all cases prepared by us, the drawings are made under our personal supervision, by skilled draftsmen in our constant employ, and every precaution is taken to have the invention fully and clearly shown by different views, so that the improvement will be readily understood by the Examiners in the Patent Office, and comprehended by the public when the patent is granted.

### Advantages to Inventors on the Pacific Coast.

The firm of Dewey & Co. has edited and published the MINING AND SCIENTIFIC PRESS continuously since 1860, a period of 28 years. Few agents, who are still engaged in the business, have had so long-extended practice in patent soliciting. The members of the firm give personal attention to the applications entrusted to their care; and their familiarity with inventions and with local affairs in the Pacific States and Territories, enables them to understand the wants of inventors on this coast more readily and thoroughly, as we believe, than any other agents in America. Thus there is saved a great deal of the time which ordinarily—when distant agents are employed—is wasted in preliminary writing back and forth.

This happy combination of long business experience together, and wide connections, has placed our firm in a position unquestionably most fortunate for affording inventors prompt and reliable advice, and the best facilities for securing their full patent rights with safety and dispatch at uniformly reasonable rates.

Every patentee of a worthy invention is guaranteed the gratuitous publication of a clearly-stated and correct description of his invention, in one or more of our influential and reliable newspapers, affording thus the circulation best calculated to widely inform the class of readers especially interested in the subject of his invention.

### Caveats.

A caveat is a confidential communication made to the Patent Office, and is therefore filed within its secret archives. The privilege secured under a caveat is, that it entitles the caveator to receive notice, for a period of one year, of any application for a patent subsequently filed, which is adjudged to be novel and is likely to interfere with the invention described in the caveat, and the caveator is then required to complete his application for a patent within three months from the date of said notice. Caveat papers should be very carefully prepared. Our fee for the service varies from \$10 to \$20. The Government fee is \$10 additional.

To enable us to prepare caveat papers, we require only a sketch and description of the invention.

### Rejected Applications.

Inventors who have rejected cases (prepared either by themselves or for them by other agents) and desire to ascertain their prospects of success, as by further efforts, are invited to avail themselves of our unrivaled facilities for securing favorable results. We have been successful in securing Letters Patent in many previously abandoned cases. Our terms are always reasonable.

Inventors doing business with us will be notified of the state of their application in the Patent Office whenever it is possible for us to furnish such information.

### FOR SALE.

A Complete Ten-Stamp Mill (NEW),

Suitable to work free-milling or sulphuretted ores. Will be delivered on board cars at Merced, if desired. Address

F. T. HOUGHTON,

Hornitos, Cal.

This paper is printed with Ink Manufactured by Charles Eneu Johnson & Co., 600 South 10th St., Philadelphia. Branch Offices—47 Rose St., New York, and 40 La Salle St., Chicago. Agent for the Pacific Coast—Joseph H. Dorsey, 529 Commercial St., S. F.

## A NEW AMERICAN BOOK

### Minerals, Mines and Mining. JUST READY.

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the useful Minerals, full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, I. L. D., author of "The Metallurgy of Iron and Steel" illustrated by 171 engravings. In one volume, 8vo., 367 pages. Price \$1.50, by mail, free of postage, to any address in the world.

CONTENTS.—PART I. MINING MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Corundum and Emery, Pumice Stone, Infusorial Earth, Glimstones, Biotites, the Diamond.

PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SUGGESTIONS, WITH DESCRIPTION OF ASSOCIATED APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 99 pages, illustrated by 105 engravings, with details too full to be comprised within the limits of this advertisement.]

Appendix. Sinking Artesian Wells, Oil and Gas Wells, Index.

An Illustrated circular, 4 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage, to any one in any part of the world who will apply by letter.

The above or any of our Books sent by mail free of postage, at the publication price, to any address in the world.

Our New Revised Descriptive Catalogue of Practical and Scientific Books, 80 pages, 8vo., and our other Catalogues and Circulars, the whole covering all of the branches of Science applied to the Arts, sent free of postage to any one in any part of the world who will furnish his address.

Sectional View of Pulverizer.

## PNEUMATIC PULVERIZER.

The principle of pulverization consists in the employment of two

### POWERFUL OPPOSING CURRENTS

Of dry super-heated steam, so arranged that they continuously charge themselves with crushed or granulated material, and by the great force and velocity of the steam currents the minerals are dashed against each other with such power of concussion as to cause the hardest ores to be pulverized to any degree of fineness desired. The high temperature of the super-heated steam currents employed, through which every minute particle of ore must pass, causes them to become very hot and dry, which produces a beneficial effect upon sulphurets and ores containing rusty gold. The light weight and simplicity of construction of the Pulverizer, the extremely small and inexpensive wearing parts, are the wonder and surprise of all who witness its operation. The Company is prepared to furnish complete plants for pulverizing

10 TO 200 TONS PER DAY,

Including a Sectional Steam Boiler supplying all the power required.

## FRISBEE WET MILL.

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

MARSHUTZ & CANTRELL, Sole Manufacturers.

Send for Circulars and Price List.

MARSHUTZ & CANTRELL.

The Patents and Manufacturers cordially invite miners to critically examine and pass judgment upon this improved system of milling and amalgamating ores in the following particulars:

1. The cost is less than one-half of stamps of same capacity.
2. The freight to mine is less than one-half of stamps.
3. The cost of erecting is less than one-fourth of stamps.
4. The power to drive it is less than one-half of stamps.
5. The wear is less than one-quarter of stamps.
6. There is no wear except on shoes and dies.
7. In point of amalgamation it is superior to any other machine in use.
8. In its simplicity of construction.

We challenge competition with Stamps, Ball Pulverizers or any other ore crushing machines now before the public.

PATENT

## LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$5.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to

## Fire-Proof Buildings and Vessels.

Mr. Samuel Liddle, well known in connection with mining matters on this coast, has patented a system of constructing fire-proof buildings and ships. Fig. 1 of the accompanying engravings is a perspective view of the improved fire-proof structure, parts of the walls being removed. Fig. 2 is a detail sectional view of one of the shutter hinges for the shutters or doors. Fig. 3 is a sectional view of the two united plates. Fig. 4 is a longitudinal perspective view of a steam vessel having its boiler and fire-room inclosed in one of the improved fire-proof compartments.

The structure is made of metal plates *A*, which are securely riveted or bolted to posts or beams *B*, provided with perforations or apertures *a*, so that the structure will consist of a hollow shell which can be filled with water, the beams, posts, etc., being perforated, so that the water can pass into all parts of the hollow shell. The water can be conducted into this hollow shell from any suitable reservoir, *C*, located higher than the building, and the pipes *c*, from this reservoir can enter the shell at the top or bottom, as may be desired. If desired, the pipes leading into the shell may be connected with a hydrant or with a water-main. The shell is perforated by a series of outlet-pipes, *M*, which are provided with suitable valves *N* as shown, which valves open

automatically as soon as the pressure of the steam created in the shell by the heat of the fire or the engine becomes too great. If desired, the outlet-pipe *M* may be conducted

shell several times. The shell is also provided with openings *O*, closed by outwardly-opening valves, through which openings the smoke or fumes in the rooms can pass off. If the pipes

For the same purpose the inventor has provided nozzles, *P*, having check valves, to which nozzles hose from an engine or from a hydrant are attached for filling the shell with water,

and so that the water cannot flow out of the shell back into the hydrant or upon the ground when the pipes are removed; he has provided automatic check valves, for it is often so hot in the neighborhood of the fire that the firemen would not be able to go to the building to turn off globe or other valves, which would have to be used if the check valves were not provided. A tank, *D*, must be provided below the structure, or below the level of the lowest point of the shell, so that the water in the shell can be drawn off into this tank, and can later on be pumped from the same into the reservoir, *C*. The plates *A* overlap each other, and are secured to each other by means of rivets, *E*, Fig. 3, which preferably have their inner heads countersunk, so that the inner surface of the wall will be perfectly smooth and can be painted in imitation of wood, stone, or stucco. The shutters are made hollow, and are hung on hollow, angular hooks, *F*, Fig. 2, which are each provided with an aperture, *b*, through which the water can pass into the hollow eye *G* of the hollow hinge bar *H*, to which the shutter is attached. The lowest hollow hinge is intended to be located so as to drain the shutter. The doors can be con-

FIRE-PROOF CONSTRUCTION APPLIED TO STEAMSHIPS.

LIDDLE'S PATENT SYSTEM OF FIRE-PROOF CONSTRUCTION.

into the tank *C*, so that the steam in these pipes *M* will be condensed by the water in this tank, and can then flow again into the shell, so that the same water can be passed into the

from the reservoir *C* enters the building at the bottom, a check valve must be provided, so that the water that has passed into the shell will be retained and cannot flow out.

hollow eye *G* of the hollow hinge bar *H*, to which the shutter is attached. The lowest hollow hinge is intended to be located so as to drain the shutter. The doors can be con-

structed in the same manner, if desired; or wooden doors can be used for ordinary use. The hollow iron doors and shutters will thus be filled with water with the rest of the shell. If the shell is filled with water, the inventor is sure that the building will be absolutely fire-proof, and the plates cannot warp or shrink under the action of the heat. Around the window and door openings the outer and inner plates are connected with the window and door frames, which must have very close joints, so that no water can leak out. It is evident that the shell is only to be filled with water when there is danger from fire.

As shown in Fig. 4, the engine-room of a steamer may be constructed with hollow walls *A* in the manner described, and the doors and the hatches are also to be made hollow, and can be hung by means of the improved hinges, shown in Fig. 2. This hollow shell, filled with water, will prevent the spread of fire in the engine-room, and will be much better, simpler and cheaper for the walls or floors than the bricks or tiles such as are at present used in engine-rooms. The entire hull, the decks and the bulkheads of steam or sailing vessels may be constructed with two iron walls and the water space between them, if desired. In all cases these shells must be provided with gas or steam escapes, so that they will not explode or be ruptured or burst by the great pressure in the shells. If a steamer, it would be advisable to keep the space *B* under the boiler continually filled with water.

It will be seen by reference to the foregoing that the doors and shutters covered by this patent could be attached to any building already constructed, rendering the same proof against fire from adjoining buildings, water connection being made by any system of water supply. Compartments could be placed in any iron vessel with little, if any, alteration in the interior of the hull. Mr. Liddle, the inventor, having been engaged in mining in Nevada since the issuance of his patent, has made no attempt to introduce it, except experimentally, when it has fully met his anticipations. He is now ready to negotiate for the use of the patent. Address Samuel Liddle, care of P. O. Box 2361, San Francisco, Cal.

**UTAH COAL.**—The Salt Lake Tribune says: Some coal mines at the head of San Pete valley have changed hands and gone into an syndicate composed of Durst, Kimball & Co., six persons in all, who have six claims of 160 acres each, making a total of 960 acres. From one of the veins, 12 feet thick, over 3000 tons of coal have been extracted in the past three or four years. It has been opened up to a distance of 60 feet in, all well timbered. Another vein is six feet thick, on which the opening has gone in 40 feet. Then there is a four foot and a three foot vein on which but little work has been done. These mines are at an altitude of 6000 feet above the sea, are only a few miles from the town of Fairview, and the coal is classed as being of fine quality. The present owners propose making improvements and hope to influence the building of a railway so near to it as to make it easy to market and the basis of a great coal-mining enterprise. The Home Coal Company mines at Coalville produced 30,000 tons of coal during the year 1887. This coal was marketed chiefly in Park City and this city. The Utah Central coal mines at Pleasant Valley shipped 44,465 tons of coal during the year 1887. The Pleasant Valley Coal Company did a big business in 1887, having mined and shipped 86,341 tons during that year.

**AMERICAN TOOLS IN AUSTRALIA.**—In the *Australasian Ironmonger* we note long lists of American goods which are highly commended; among these are saws, spades, shovels, picks, weighing machines, Rand rock drills, "the most popular drill in New Zealand, and, perhaps, in the other colonies," rackerock axes, Worthington's steam pumps, mill machinery, American stoves, "always growing in popularity," tram cars, barbed wire, lager beer, and innumerable other articles. There are numerous references in our Australian exchanges to the great mining records, almost equaling our own, made with the Rand Slagger drills and rackerock; in fact, we have before us a list of no less than 31 different parties in New South Wales, Victoria, Tasmania and Queensland, that are using these deservedly popular American drills and explosives.—*Engineering and Mining Journal*.

**EUROPEANS LOOKING TO THE UNITED STATES FOR ARMAMENTS.**—The sure and near prospect of a general European war is inducing some of the minor powers to look elsewhere than to their sister nations of Europe for their munitions of war. Italy is already negotiating with American firms because her own works at Spezia are unable to turn out work as fast as needed. Spain will be the next. The Spanish Cortes, which recently adjourned, voted \$45,000,000 for new iron-clad. Notwithstanding a provision was placed in the bill requiring the work to be done by Spanish labor, no doubt more or less of it will be ordered by the contractors from this country. At any rate, it is quite sure that English workmen will not be benefited by the appropriation.

**FAST SAILING.**—An ice yacht will skim along at 70 miles an hour.

## CORRESPONDENCE.

We admit, unindorsed, opinions of correspondents.—Eds.

### From Soulsbyville, Cal.

**EDITORS PRESS:**—I send you a few mining notes from this place and vicinity. This county has had a black eye for several years, but of late there is a little boom in mining. Capitalists have taken hold of a few of the mines, and no doubt the majority of them will make first-class properties; but there are still mines lying idle that I know to be good if men with capital would take hold of them and expend a few thousand. The owners are not in circumstances to do it themselves, but are willing to hand and give ample time to prospect them thoroughly before paying for the mines. I hope to see them opened soon, as I am sorry to see such mines idle for the want of capital. There have been some good mines in the county, and there are still good ones. One great drawback is a certain class of men who have what they call mines to sell, and in order to get mining men to examine them will speak ill of other good mines.

As a general rule, their mines are nothing more than a hole in the ground. The sale of several mines in years past has been broken by this class of men. They are a great drawback to the county, and the sooner they are found out the better it will be for mining.

A San Francisco company has hooded the Platt and Gilson mines, the south extension of the famous Soulsby mine. They have put a force of men to work putting up buildings, and they will commence the erection of hoisting works as soon as machinery arrives. They are also digging a ditch to connect with the Soulsbyville branch ditch to get water for hoisting and pumping purposes. The pipe has just arrived and is being put in place. They will have a pressure of 200 or 300 feet. The above mines were worked in early days to the depth of about 100 feet, and thousands of dollars were taken out, the ore paying as high as \$90 per ton. The Soulsby has been one of the best mines in the county. And as the Platt and Gilson form the extension, there is no doubt but what they will be equally as good as the Soulsby when fully opened.

Last week two veins were struck in the Basin mines. The ore is said to be very rich. A company has the mines hooded, and have expended several thousands, but it looks favorable for a fine property. It was worked in early days by the Lewis Bros. to the depth of 100 feet. They took out several thousands, and had eight or nine veins all in paying ore.

A full force of men is now employed at the Black Oak mine. The mill was started on Monday of last week. They have a large vein and good milling ore, being about one mile from the Soulsby mine, which has been one of the best mines in the county.

Messrs. Lowe and Moore, who have the Woodpecker mine hooded, are sinking a shaft on the vein which is small, but some of the ore is very good.

The Dead Horse mine has a full force of men employed. They have sunk the shaft to the depth of 500 or 600 feet and have cut the vein at the different levels, which is of good size and all pay ore.

Rock is being taken out of the Fifth Ward claim that will go \$500 or \$600 to the ton, but the vein is very small, rock hard and consequently it takes considerable time to get out a few tons; but the parties working it are sinking on the vein and are in hopes the vein will enlarge in going down.

Soulsbyville, Cal.

### Tracing Ancient River Channels.

**EDITORS PRESS:**—Your correspondent, H. Clendenen, in the issue of the MINING AND SCIENTIFIC PRESS for Feb. 11th, seems very enthusiastic over the important discovery he has made, a discovery, as he says, which has hitherto "bested the skill and capital of the world to find out;" and I sincerely trust that the gentlemen will be induced to communicate his discovery through the MINING AND SCIENTIFIC PRESS to the world, which is badly in need of such important information to establish their faith in gold mining, especially gravel mining in Nevada county.

After spending several years in the scientific exploitation of ancient auriferous river channels, and knowing how valuable such mining claims are when they are found under favorable conditions, in the right situation, and when managed by those who know how to work them, I have no hesitation in saying that a real discovery of this kind is of importance. But it is a well-known fact to all mining men who have been called upon to expend money in searching for and working such placer claims, that all the mining population who have stood by their claims for the last 30 years in the counties where those ancient rivers exist, are each and all endowed with just this scientific faculty, and whose faith in holding on to their claims through all those years has been the result of just such a discovery as Mr. C. mentions.

And it almost looks like an insult to those old miners of the 40's and 50's in Plumas, Sierra, Nevada, and Placer counties, to tell them that the above discovery has just been made. How

many scores of such placer-mining claims do I know which the owners have stuck by for all those years, and spent the assessment work in keeping the lines hushed, and who have refused tempting offers from capitalists, and all because they are so highly gifted as to know just how many millions of dollars lies within their claim. Now to tell them that this knowledge is a new discovery is certainly very tantalizing to say the least. Of course it may be new to Mr. C., but it is not new to the miners of the Sierras; and any capitalist who would like to invest with certainty in such class of mines will have no difficulty if they are willing to pay a fair price, and apply to any respectable mining engineer acquainted with those districts.

If Mr. C. will kindly communicate his discovery to the PRESS, I will be very pleased to criticize the same, and add a little more of my experience on the subject.

ROBERT STEVENSON, C. E.

Lick House, S. F.

### Use of Oil on Rough Seas.

**EDITORS PRESS:**—"Philosophy of the Use of Oil on Rough Seas" was the title of an article published in the columns of the PRESS of Jan. 14th. Since writing that article Orin Dennis of Alameda Co. gave me the following account of an incident in his sea-faring life, as a proof of the magical effect of oil on a rough sea, which in that instance saved the vessel from shipwreck, and the crew from a watery grave.

In Oct., 1844, the schooner Six Brothers of Boothbay, Maine, Capt. Farmer, coming from the Bay of St. Lawrence, very heavily loaded with kench eated codfish, encountered a heavy gale when homeward bound coming up from Cape Canso to Cape Sable, thence across the Bay of Fundy to Boothbay.

After passing Cape Sable, running dead before the wind, under close reefed foresail, at the rate of ten knots an hour, with an increasingly heavy sea, the danger of running on to a lee shore became imminent if that rate of speed was kept up. Not daring to heave to in such a heavy sea, it became necessary to devise some means of slackening the speed. All sail was taken in, and, succumbing under bare poles, the sea was still so rough that every sea was breaking heavily over the schooner; some other means had to be resorted to, to save the vessel and lives of those on board.

There were two large casks, one on either side, fastened to the sides of the vessel abreast of the main rigging. These casks contained cod-liver oil.

A small gimble-thole was bored in each cask, so the oil would run out very slowly into the scuppers, and as the waves broke over the deck the oil was washed overboard, and soon the benefit of this oil was noticeable. The heavy swell continued, but the sea no longer combed; the oil gave the sea a smooth, glassy appearance and relieved the vessel from the heavy burden she was laboring under. They ran now at the rate of about five knots an hour, saving the vessel from running on a lee shore.

At sunrise the next morning the weather moderated, and at 2 o'clock P. M. of the same day they made Monagan island, 16 miles from Boothbay. They had light winds from there into port.

At ten A. M. the next day they ran in alongside the wharf where the anxious wives and mothers were gathered to meet their husbands and sons.

That application of oil saved the vessel from breaking up in that terrible sea and saved also the lives of the crew without doubt.

Five other schooners sailing from the same port left Cape Canso in company with the Six Brothers, and were crossing the Bay of Fundy at the same time. Nothing was ever heard of any of these other vessels or of any one of the crews.

M. A. S.

**THE COAL MARKET.**—Coal continues scarce and high in San Francisco, and the yards are no better off for supplies than they were some weeks ago. Every coal vessel that comes in is discharged without delay, and those that have coal available for retailers are besieged with long lines of carts and wagons awaiting their turn. An encouraging sign is the advance in wheat freights outward. This will tend to attract vessels to this port, and most of the wheat ships bring coal. Freight rates have been discouragingly low for months, and many ships have kept away from this port in consequence, and this largely accounts for the present scarcity of coal. A local circular says: "The outlook is for an almost ascertained continuance of high prices for several months to come, as no source for early relief is visible; most of the cargoes of foreign coal now en route have changed hands several times since shipment, and all near at hand are held at fancy figures. The scarcity of tonnage for coal in Australian waters has caused the engagement of a large number of vessels on this side to proceed to Newcastle to load and return with coal, and freight quotations have gradually advanced from 21s. 6d. to 25s. per ton, with further advance anticipated. If the coast collieries fulfill their promises of an output within the next three months, it may stay any further advance, but it is natural to suppose that present figures for their product has encouraged them to send to market all they could possibly extract."

### James Watt's Workshop.

A Visit to the Birthplace of the Steam Engine.

[Written for the PRESS by J. RICHARDS.]

The private or home life of James Watt is but little known beyond the neighborhood of "Heathfield." This name is that of the old homestead, three miles or so from Birmingham and nearly two miles from the old works at Soho, of which every one knows something.

Heathfield consists of 19 acres of heavily timbered woodland, in the midst of which is the plain old mansion of James Watt—not quite so plain now as formerly, because in the fitness of things, the place was leased about ten years ago to George Tangye, Esq., of the celebrated engineering firm of Tangye Bros., who has added various improvements and beautified the old mansion in various ways.

Shortly after Mr. Tangye took possession of Heathfield, the writer was invited to spend an evening there and examine in company with Mr. Tangye "Watt's room," which to that time Mr. Tangye himself had not fully explored.

In the lease is included a bond of a large sum binding the lessee to keep intact this room, sacred to the engineering world—a kind of mechanic's "Mecca," that is to last yet for generations to come, no doubt. Watt's room, as it is called, is a private workshop in which Watt, after retiring from active life at Soho, spent his time in experimenting and constructing machines.

It is in an angle over the kitchen room and attainable by a narrow and rather obscure stairway. It is about 20x16 feet, and contains a world of queer things, which it will be impossible to describe here.

Just before entering, the writer's attention was drawn to a small circular shelf alongside the door where it was the custom to leave Watt's luncheon at the middle of the day. He would not be disturbed at that hour and the custom was to eat his luncheon there, rap on the door, and come back in an hour to remove it intact or partly eaten, as his inclination and time permitted. In the evening he dined with the rest, and threw off his shop cares.

In the room is a very complete foot-lathe with a complement of all kinds of rotary implements that can be applied by a lathe. There are not less than 50 drawers in the room, all of them filled with various kinds of tools and supplies. The tools were very complete, and in most cases laid in wooden trays to fit, or else wrapped in oil paper.

On every side was order and method.

A large open stove of the "Franklin type" was employed for warming the room, and in it are the embers left undisturbed since 1819, when Watt died. On the top is a circular hole to receive a crucible in which there is now some remnants of an assay of some kind he had been making just before his death.

At this time he received from some of the mines in Cornwall the royalties on his engines in ore or unrefined metal, and it is supposed he was testing and valuing some of this at the time the last fire was lighted.

The strangest thing in the room is, however, his copying or pantograph machine, as perfect a one as has ever been made at least in all essential functions. It is mounted on a frame of beech wood, about five feet square and four feet high. On it is a bust of a human head one-half completed, and a perfect prototype of the original which is alongside.

As Watt died in 1819, the query arises how could Blanchard or others afterward secure patents on a copying lathe for shoe lasts, gunstock and so on when there long before was a completed machine of the same kind, a refined one and capable of executing the most delicate copying.

The writer, at the suggestion of Mr. Tangye, climbed up to explore a high shelf containing things not visible from the floor. Mr. Tangye waiting to receive what was handed down. Imagine the sensation of rummaging over these things, undisturbed since they were placed there by the father of the steam engine, near 70 years before! Everything was covered with a heavy layer of dust, some places half an inch deep. Among other things was an earthen jar of mercury that was at first thought to be "glued down," because of its weight. A half-inch of dust removed showed the mirror surface; a large meerschaum pipe, well colored and bearing unmistakable evidence of faithful use; next a roll of papers, neatly covered and tied. These proved to be shipping lists for engines identical with some that had been recently shown as a new invention. The lists contain the names of all the details of a steam engine in a column, and opposite a line for numbers. In shipping, the things sent are marked with the number of pieces, and what is not sent is crossed out.

It is impossible to attempt even a partial description of what the room contained, or what it does contain, for there it must remain until the dust of ages has obliterated it, unless destroyed by fire. As before said, the lessee is bound to maintain all as it exists, making only such changes as will prevent destruction. It was at the time discovered that one of the poets of the copying-machine frame was dangerously worm-eaten. Mr. Tangye proposed to renew this, and permitted the writer to saw off a length which is now at the Mechanics' Institute, in this city. A bust of Watt in the main

hall, as one item, appears in the band noder a forfeitures of 100 guineas for injury or defacement. Among the forest trees is, no doubt, a California gray squirrel, carried from San Francisco in a cage by the writer's wife, and presented to Mr. Tangys. These beautiful animals have no prototype in Britain, and were much prized, but ignorant, of course, of his classical surroundings at Heathfield.

Watt is gone with Bolton, Murdock and the rest, but the old works are there yet, "James Watt & Co., Engineers, Soho." Of this, however, I can do no better than to offer a reprint of a letter which I wrote for the Philadelphia Press not long since.

James Watt & Co., Soho.

Three miles or so from "Brommagen," Borough-Mitcham or Birmingham, all names for the same town, in a northwesterly course, "out Smithwick way," is "Soho," the birth-place of the steam engine, the place of Watt's latest labors, the place of his triumph and that of Bolton's, not less to be held in remembrance. Starting from Birmingham on foot, after some scores of tortuous windings and turnings through lanes, streets and even through turnstiles, one comes to "Soho," or the edge of it rather, and there, on the bank of the canal, can be seen, by going through a narrow street, painted in large white letters on a gate, "James Watt & Co."

There is no humbug in the case, if we except the fact that James Watt died in 1819. There is the old shop, most of it—or part of it, at least—just as he left it; not a small shop, but a vast collection of shops, sheds and so on, making up what is in England called an engineering works. And well worthy the name, too, for one can there see in process of construction huge marine and other engines modern in type. Not a defunct shop by any means. It is only three years or so ago when James Watt & Co. constructed the famous pumping engines for the sewage works at Pimlico, London, a piece of engineering work worthy of Penn or Mandeslay.

The tools are a marvel and a wonder. Side by side we may see drilling and other machines, one of Watt's time and the other of the latest Manchester type; mostly, however, old tools—vast, roomy and efficient—driven in some cases by large wooden drums, six to eight feet in diameter, carried on square shafts revolving at 20 to 30 revolutions a minute.

Here is the romance of the steam engine, and one who has read of the trials, disappointments and labors of Watt and his courageous partner, Bolton, feels like removing his hat and standing in reverence before these, the first agencies in producing man's strongest ally, the steam engine. Sometimes we hear it said that Watt invented the condenser, governor and some other details, but this is not correct. He invented the steam engine.

The term "inventing" is a broad one. It covers more than the conception of a new thing or even making it. In Watt's case it means a hundred fold more if we include his disheartening labor of forcing people to accept the invention. He labored night and day for years, impetuous and threatened with a debtor's prison, against the pangs of disease and the derision of every one—even labored against the laws of his country, which nearly snatched away his invention at one time. But to return to the old shop.

There are five or more steam engines in the works, all of them old and quaint. Two of the most ancient ones are in charge of an old man, who, with his gray hair, seems to be an integral part of the machinery. The largest, a huge beam engine, which was silently working away, he said "had not required a new brass for 20 years, and now, after 70 years of service, was as good as ever." The other one, a kind of hell-crank engine, near by, was inquired about. "Don't you see, sir," said the old attendant, "how smooth she works; not a brass has been put in or a new part supplied for more than 40 years," and he was right no doubt.

Half a mile away in Soho proper is Heathfield hall, Watt's old home, where he rested and died. Not rested wholly, because there is a room kept sacred and as he left it—his workshop. What a privilege to see that! I had visited various famous places in the Old World and the New, but never entered a door with the same feelings of reverence that I did on that occasion, when, with candles, which shed a gloomy light around, we stepped into Watt's private workshop.

**NEW COAL FIELDS.**—Dunsmuir & Co. will commence immediately the opening up of a large extent of coal lands in Como, B. C. They include a district some 10 miles in length, and will necessitate the construction of about 13 miles of railway and a large extent of wharfage. Railway surveys will be completed in two weeks' time, and 700 men will then begin building the railway and wharves and developing the mines. The owners anticipate being in position to ship coal from the new mines early in the fall. Mr. Dunsmuir expects the daily output, when the mines are thoroughly opened up, to reach 2000 tons.

**STOCKTON, Utah,** gives signs of more activity in mining this season than in the past. There is a feeling among owners of property that the camp is bound to come to the front with large production and good development of the ledges, and this has inspired such confidence that most of the claims will be prospected during the summer.

## Health Homes on the Desert.

While there is little doubt but the invalid class is on the increase in the United States, and perhaps also in most other civilized countries, it is notoriously the case that the victims of consumption are being everywhere multiplied at a very rapid rate. Of the deaths that occur in the Atlantic States 20 per cent or more are caused by affections of the respiratory organs, pulmonary or bronchial, both being in most cases involved. There was a time when the notion obtained among the practitioners of the healing art that this disease could be cured, or at least palliated, by drug medication—an idea that has become to be so thoroughly exploded that it can hardly be said to hold any longer a place in the therapeutics of even the most conservative school of medicine. It is now admitted by the profession everywhere that about all that can be done for this class of ailments is to place the sufferer under the most favorable conditions and leave nature and natural remedies to work a cure or stay the ravages of the malady as far as may be. To this end, the first thing to be done is to supply the sufferer with fresh air and plenty of it. The next thing to be done is to keep him as much as possible in the sunshine. Then come in good water, suitable diet, judicious exercise, bathing, and such other auxiliaries as in every disease tend to a restoration of health, the air and the sun being the agencies most to be relied upon for cure or relief in cases of consumption, though there are numerous other bodily ailments in which these will be found almost equally effective.

If then the theory above advanced be correct it becomes pertinent to inquire after the country or locality that to the largest extent meets these requirements—where shall we find the purest air conjoined with the least interrupted sunshine. In our opinion this condition of things will be found in the barren region that occupies the southeastern angle of California—anywhere on the Mohave or the Colorado deserts. There is not in this region, covering an area of 20,000 square miles, an acre of malarial land, there being here more than 300 absolutely clear days in the year. As the annual rainfall hardly ever exceeds six or eight inches, the surface of the earth is nearly all the time warm and dry, and everywhere as clean as a well-kept park. While the summer months are extremely hot, the temperature during the rest of the year is moderate, and the climate in all respects delightful. No snow falls here except on the mountains, nor is ice to the thickness of an inch ever seen. The doors and the windows may be kept perpetually open, nor are there a dozen of nights in the year but what a man under a pair of thick blankets can sleep in the open air without peril to health or the least discomfort. Even the most delicate invalid could, if so disposed, keep out of doors nearly the whole time; and thus would the consumptive patient be able to avail himself of the heat possible means of recovery. While this region would offer to every person of impaired health an incomparable winter resort, it would be to those afflicted with cutaneous and pulmonary complaints especially well adapted.

From what has been said the reader will infer that this great southeastern Sahara is not a very attractive country as regards soil, scenery or natural productions, as indeed it is not. It is what its name implies, an arid, sterile waste, so barren of even the lowest forms of life—sustaining foods that the Digger Indian, least dainty of mortals, has never been able to subsist there. It is, in fact, an almost rainless, treeless, waterless region, yet withal so clean and pure, so free from mists and clouds and insect pests, so sequestered and quiet, that it ought to form a welcome retreat for those in search of health, rest and peace.

A race is coming on—a race has already arrived—who are so far gone and effete that they require not so much exercise or recreation as absolute rest—rest, not only from work and the worry of business, but rest from the excitements and the excesses of a too active or a too luxurious life. If we could confine them in a vacuum or temporarily suspend animation, it would be the proper treatment for them. It is just because there is nothing or so little on these deserts that they would constitute the most suitable asylum for a class of patients whose vitality is so nearly extinct.

Exercise if needed could, of course, be taken here. There are mountains that might be climbed, while the pedestrian so disposed might start out and walk a hundred miles in almost any direction without impediment. The most of the country being level and the surface hard, riding on the bicycle could be practiced to good advantage, the opportunities for locomotion by other methods being equally good. Being traversed by several railroads, this region is easily accessible from every quarter. That there will in due time be established here a sanitarium for that class of valetudinarians who require most to bathe in the sunlight and to plentifully breathe the pure air, and for those who need mere abatement more than anything else, we verily believe.

It should be stated that water can be obtained in most places on these deserts at considerable depths. It is apt to be soft and pure, and, while the flow is not always heavy, it would, in most instances, suffice for the uses of a large establishment, baths included, provided the number of bathers was not inordinately large or their ablutions unreasonably frequent. The

practice of hydropathy might not always be feasible. The disciples of that school might, in some cases, have to forego this pleasure of the plunges bath and the douche, though the dripping sheet and the wet compress would be luxuries in which they might occasionally revel. In the sun bath all could indulge without let or limit, and in the atmospheric sea, charged with the life-giving ozone, lave themselves to their heart's content.

## Idaho Districts.

The Boise (Idaho) Statesman makes the following extracts from the Board of Trade Report: With regard to mining, from the best information we can obtain, we find the output of this year 1887 is about \$9,500,000 in the Territory. Of this amount we find that Ada county has furnished \$200,000, Alturas \$3,300,000, Boise \$659,000 and Owyhee \$150,000.

The different mining districts in Southern Idaho, more or less tributary to Boise City, are generally improving.

At Rocky Bar the Alturas limited has produced during the past year about \$340,000. The Wide West mine, which has been lying idle for years, has recently been purchased by an English company which expects at once to proceed to work to sink a shaft of 500 feet in depth. The indications are that within two years there will at least be 250 stamps dropping in the vicinity of Rocky Bar, and the output from this section of Alturas county will soon equal if not surpass the Wood River country. Some communication directly with Rocky Bar, either by wagon-road or railroad, would greatly increase the business of Boise.

At Atlanta but little work has been done. Mr. Miller, superintendent of the Tahoma mine, proposes this coming summer to erect a 20-stamp mill to concentrate his own as well as on others.

The new district of Pine Grove last year turned out considerable haulion. A St. Louis company has invested in the district and proposes to erect a 30-stamp mill.

At Wagon town, Mr. De Lamar has opened up the Wilson mine and the showing is fine. He is forming a company to erect a large mill on this property.

The Henrietta mine is also doing well. It is operated by the Proustite Company of New York.

On War Eagle mountain the Owyhee and the Empire are being worked.

On Florida mountain some new developments have been made. Messrs. Phillips and Sullivan are working successfully.

In Boise county a number of mining enterprises are successfully carried on.

The Gold Hill mine, one of the most successful mines in the Territory, still continues to produce, also the Forest King. A new mill will be erected on the Gambrine this year by its owner, Mr. Cunningham.

The Elmira at Banner continues to run its 25-stamp mill. Its annual output is about \$150,000.

The placer mines of Boise county produced last year about \$500,000. These placer mines will continue producers for many years to come.

At Sheep mountain many of the mines are looking well and bid fair to develop into fine paying properties.

Deadwood is looking well. A New York company has purchased large placer claims and are building a large ditch to operate them.

In the Wood river country many new and valuable strikes are reported, and while many mines have shut down for the winter an unusual active year is anticipated.

**MINERAL PRODUCTS IN THE BUTTES.**—A dispatch from Marysville says: Reports from prospectors in the Buttes back of Sutter City are more favorable. On the Moody place the coal vein is said to be widening as the development goes on. Like reports come from the Newcomb place. The coal is pronounced bituminous and undoubtedly of good quality. In prospecting for coal a large deposit of potter's clay has been discovered, and is said to be of finer quality than that used at the pottery works in Lincoln, Placer county. First-rate specimens of gypsum, in the form of selenite, was found in the Buttes many years ago, and attention is being again called to this mineral. The extent of the deposit is not now known. Four men left Marysville to-day to continue prospecting for natural gas and oil on Eli Davis' ranch in the Buttes. They have found oil floating on water that issues from a tunnel. The Sutter City people are much excited over the mineral prospects in the Buttes. The town is going ahead very rapidly. New buildings are going up, stores being opened, and work has commenced on the school building, which is to cost \$10,000. The contract calls for its completion in 90 days.

At Silver Reef, Utah, the Stormont mill is running steadily and crushing an average of 20 tons of silver sandstone ore per day. This is chiefly custom work, for which the mill gets from \$5 to \$7 per ton, the average being about \$6. The ore runs from 10 to 20 ounces silver per ton, with some as high as 25 and 30. The Christy mill is crushing ore at the rate of 40 tons per day. That company works ores only from their own mines, chiefly the California and Stormy King. In the former the ore shows finely now in the lower level.

## Copper in 1887.

James Lewis & Son's (Liverpool) review of the copper market for 1887 shows that the year opened with Chili bars £38, 10s., and early in January half of the Anaconda furnaces were shut down. At the beginning of March they commenced full operations again; also the Copper Queen of Arizona. Chili bars that month rose to £39, 6s., 3d. In April the price ranged up to £40; in May there was a slight drop; in June it ran up to £40, 6s., 3d.; in July the highest was £40, 5s.; and in August £40, 7s., 6d. In September the market was flat, closing at £39, 15s.; in October it rose to £40 during the first three weeks and then the boom commenced, and the effect of a meeting in New York between the representatives of the chief American producers and of the Rio Tinto, where a limitation of production was proposed, was several large purchases of Chili bars, and an advance to £44, 5s. Though the combination was not made, the French syndicate purchased largely through November, and the price was driven up to £68, rising to £85 at the close of the year. The Calomst and Hecla fire aided the operations of the syndicates largely. The total import of copper into England and France is 7672 tons less than in 1886. This is due to a decrease in the supplies from Chili of 6429 tons, from Australia of 4049 tons, from Japan of 3372 tons, from Quebrada of 794 tons, and Newfoundland of 532 tons; while there has been an increase from the United States of 2794 tons, from Spain and Portugal of 3496 tons, from the Cape of 1193 tons, and from other countries of 16 tons.

Of Montana the circular says: From Montana we expect an increased production this year of at least 20,000 tons over the 9000 tons increase of 1887, advantage having already been taken by some of the companies to sell part of their production up to the end of 1888, at prices that will leave a very good profit. The recently constituted Boston-Montana Company is at present producing about 1000 tons of 60 per cent matte per month, and is expected before the year is finished to be turning out almost as much copper as the famous Anaconda, the Mountain View mine being very valuable and having large quantities of good ore in sight, the richer portion of which is now being shipped without smelting. The Anaconda Co. has recently put about 1200 tons of ore daily through their concentrators, producing about 3500 tons of 60 per cent matte per month in the furnaces; the ore from the Anaconda and St. Lawrence mines is, however, becoming poorer in copper as greater depth is reached. New works are in course of erection, but at present delayed by the winter, intended for the treatment of the ore from the Chambers' group of mines, recently acquired by the company, which contains about 7 to 8 per cent of copper, and from them not less than 1000 tons per month of 50 to 55 per cent matte is expected to be produced.

A survey of the whole American field is concluded as follows: We, therefore, estimate that the total United States' production should copper remain at or over £60 per ton, will not be less than 105,000 tons of fine copper for 1888. As the production of the United States for 1887 was about 9000 tons over that of 1886, the exports 3000 tons greater, and the estimated stock on the 31st of December, 12,053 tons against 6696 twelve months previously, it would appear that the consumption has increased very slightly. Against this we may look for an increased consumption, both in Europe and the United States. In this country large orders have lately been given out for the building of steamships, the use of copper wire for electrical purposes is extending, trade is reviving, and there is increased activity in the manufacture of machinery and of sugar-producing plant. It remains to be seen to what extent the present high cost of copper will diminish the ordinary consumption.

**THE STANFORD UNIVERSITY.**—The stonework of three of the picturesque one-story buildings of the Leland Stanford, Jr., University is now all completed. The ground plan of the buildings is in the form of an E, facing north, and the completed buildings are known as Nos. 4, 5 and 6 on the east side of the group. Work on three more buildings is in progress. The material is yellow sandstone, from the quarries near San Jose. The roofs of the buildings will be of red tile and similarly roofed. Connecting all the buildings will be a long corridor supported by stone columns with arches, like the courtyard corridor of some of the old missions. The architects designate the style as mission architecture, being an adaptation of old Moorish or Spanish architecture, many features of which were made use of in the construction of the mission churches of California.

**A GREAT CHINESE OVERFLOW.**—The details of the late Chinese flood, as they have come in, form one of the most terrible stories of suffering of which we have any record. What was a short time ago a beautiful, populous district of 10,000 square miles is now a rolling sea. At least 3,000,000 people are homeless and absolutely destitute of the bare necessities of life, while it is thought that over one million of people have lost their lives. The Government and the people are doing all they can to assist the two million survivors who have lost their homes, fields and everything upon which they depended for a living.

## TABLE OF CONTENTS.

ILLUSTRATIONS.—Liddle's Patent System of Fire-proof Construction, 117. Section of M. P. Boss' Standard Pan, 121.

EDITORIALS.—Fire-proof Buildings and Vessels, 117. Passing Events; Character and Value of Mining Reports; The Alien Act; The Proposed Debris Investigation, 120. Mining in Costa Rica; The Boss Amalgamating Pan; Mining Stocks and Mines, 121.

CORRESPONDENCE.—From Soudsville, Cal.; Tracing Ancient River Channels; Use of Oil on Rough Seas, 118.

MISCELLANEOUS.—James Watt's Workshops, 118. Health Homes on the Desert; Idaho Districts; Copper in 1887, 119.

MECHANICAL PROGRESS.—Decay of Iron—Grotton Iron; The Effect of Repeated Heating on Iron; Brittle Iron; Lustrous Surface on Steel; Repairing Wheels; A Machine for Testing Railway Tires; Enlarging a Tire on a Wheel, 122.

SCIENTIFIC PROGRESS.—Is Type Writing to Supersede Telephoning? The New Glass for Microscopes; Artificial Silk; "Blizzard" Fine Ruling; Utilizing Electrified Balsam; Nocturnal Photography; A New Insulating Composition; Photographic Meteorology; One of the Sea's Dangers; The Gastric Juice, 122.

ENGINEERING NOTES.—A Giant Undertaking; Russia's Great Railroad; The Bridge Over the Straits of Messina; Combining the Elements, 123.

GOOD HEALTH.—Cure for Dandruff; Car Fumigation; Health Hints; The Object of Cooking the Food; The Indian and Physical Pain; Do You Smoke; Alcohol and War, 123.

USEFUL INFORMATION.—Correcting Dents and Scars; Machine Towels; A Steel Street Pavement; Curious Experiments; Letter Copying; Cement to Mend Iron Pots and Pans; To Calculate Water in a Pipe; A Roadbed of Salt; Long-Distance Telegraphy, 123.

MINING SUMMARY.—From the various counties of California, Nevada, Arizona, Colorado, Idaho, Montana, New Mexico, Oregon, Utah, Wyoming, 124-5. MINING STOCK MARKET.—Sales at the San Francisco Stock Board, Notices of Meetings, Assessments, Dividends, and Bullion Shipments, 125.

## Passing Events.

We have been treated to quite a spell of warm weather during the week, with a dry north wind. The north wind will do little harm at this time.

The reduction works at Portland, Oregon, have again started up after a period of idleness. The success anticipated has not been met, and efforts are being made to get better rates on ore.

The question is up again in Congress, and has been favorably reported, to have a Government investigation of the debris question. It is opposed by the anti-debris people as a matter of course, but if some means could be devised to again permit hydraulic mining without injury to others, it would be a good thing for the State.

The copper syndicate seem to have been successful in cornering the copper of the world, as well as the output to come for several years. All the copper purchased is being sent to Europe.

There is quite an excitement near Carson over the recent finds in that vicinity.

Washington's birthday was duly celebrated as a holiday in this city, and the militia and U. S. troops were reviewed at the Presidio by the Governor and staff. Thousands of people witnessed the review.

## Character and Value of Mining Reports.

While the most of the reports made by our mining experts on properties they are called upon to examine are, no doubt, useful and reliable, it is matter for regret that there should be so many exceptions to this rule. Unquestionably these reports have of late years been entitled to more confidence than were those gotten up during the earlier history of mining on this coast, when investors were less exacting than now, and when the calling was crowded with upstarts and incompetents. Nevertheless there is reason to fear that much of this work is still done in a hasty and haphazard manner, the expert accepting too often the statements of others instead of ascertaining the facts by actual tests and personal examination. In this way the man of books and science exposes himself to be misled, and even runs the risk of being sometimes badly imposed upon. In the performance of his task the mine inspector must necessarily depend on those conversant with the history and condition of the property for much of his information. Still, he ought himself to be possessed of such knowledge and experience that he will not go far wrong on any vital matter.

Generally speaking, too little time is taken in the performance of this kind of work. The expert is in too much of a hurry. He runs through the mine, taking out here and there a little ore for assay. He asks a few questions of the superintendent or any one else he may happen to fall in with and his task is done, a day or two generally sufficing for its performance. He has seen but little, and much of that through the eyes of others. What can a man learn about a mine from such a cursory inspection as that? Not enough surely to make his knowledge a safe basis for the investment of large sums of money or for other important business transaction.

The vocation of the mine-viewer may he said to divide itself into three distinct classes, for, although not all of these may be recognized as legitimate members of the profession, there is always these three classes in the field; first, we have the self-constituted, self-proclaimed expert, who, without education, experience, or other qualification, sets up in the business, having for patrons those who want always a flaming report at a small price; a school of experts happily not so numerous now as of old; may their number continue to diminish. Then comes the really competent, intelligent, painstaking man who does his work thoroughly and eschewing speculations and theories, makes a report, short, practical and to the point. He is apt to be safe, sensible and trustworthy.

Finally, we have the scholastic expert, the man of profound knowledge and many acquirements, who begins at the beginning and goes to the bottom of things. His report is learned and voluminous, covering not only matters pertinent to the business in hand, but all kindred topics as well. Going back to the dawn of creation, he travels down the eons pointing out the physical changes that have since taken place. He discourses on the Paleozoic, the Mesozoic and the Cenozoic; dwells on the various epochs of animal life, describing the habits and appearance of the silurian reptiles, the ichthyosaurus, the pleiosaurus and the pterodactyls. He explains the agencies by which the fissures are formed and filled; whence come the ores and how they are deposited; in which connection the aqueous, the igneous and the magnetic theories are fully discussed. Coming down to the age of the Lower Cretaceous and the Old Red sandstone, he tells about them. Next he attacks the Frisssio and the Jurassic, and proceeding, talks about the Eocene, the Miocene and the Pliocene; about andesite, porphyrite, diorite and sienite; longitudinal, transverse, syndinal and anticlinal axes, and innumerable other ones, ites and axes, slinging solid chunks of geology around with an appalling looseness.

Now, while such display of book-learning is well enough in its proper place, it had better be omitted from a mining report, which should be thoroughly utilitarian and brief as possible, containing only information of an exact and practical kind. Any irrelevant matter, by distracting the attention, diminishes its value.

The trials and the temptations of the expert are many. He is in numerous instances employed to examine a property in which his em-

ployer has unbounded faith. He believes it to be a good one, and even possessed of great value. The expert discovers that this is an error, but being a compassionate person, he dislikes to rudely crush out the hopes of the owner; so, compounding with his conscience, he suppresses a little here and exaggerates a little there, producing a report much more favorable than the facts will warrant. Only on this hypothesis can we account for the highly colored statements so often found in these mining reports.

Going back through the files of the MINING AND SCIENTIFIC PRESS, there will be seen in almost every issue one or more announcements of some mineral find to the overshadowing importance of which the expert has duly certified. Now it is a bonanza of gold and silver; then a bed of anthracite coal equal to the best Cumberland, or may be a canal coal, so inflammable that it burns if you but touch a match to it. If these reports might be credited there occurs in nature not a metal or minerals but we have the same on this coast of every variety and in endless profusion. These being authority, we have here deposits of kaolin superior to the finest Chinese clay; antimony glsore; monntains of cobalt, nickel and tin; better marble and more of it than the Italian quarries can boast; cement, compared with which the Portland article is hardly better than ashes; not so many diamonds as in South Africa, but this only because we have not yet found them! As for iron, graphite, chromium, and a dozen other of the useful metals and minerals, we have such store of these as no other country on earth can claim!

Some years ago a Cornish expert, after having examined the San Jacinto tin mines in San Bernardino county, declared that he saw there more of that metal than could be found in all Cornwall. Of course the tin may be there, but there is no lack of courtesy in saying the men did not see it, nor has any one else ever seen it in any such quantity as by him represented. And yet this was not a willful misstatement. The Cornishman blundered—mistook a great deal of stuff that he saw for cassiterite that was not such. Then, very likely, he cheated himself, as many experts do, in selecting his samples of ore for assay.

The mistake of this man, though a signal one, was hardly greater than has been made by every mining expert on this coast, even those enjoying the highest reputation; and there is this more to be said: The mistakes committed by our own experts involved in most cases heavy losses, whereas the Englishman's blunder proved very likely a harmless one. The lesson taught by these errors, however caused or by whomsoever committed, is a simple and obvious one. They admonish to greater caution in the discharge of the very difficult and responsible duties here remarked upon.

CALIFORNIA HISTORICAL SOCIETY.—At the annual meeting of this society the following officers were elected: President, John T. Doyle; vice-presidents, John R. Jarboe, William Norris, Rev. A. Varsie, S. J.; treasurer, Joseph A. Donohoe; secretary, Wm. Carey Jones; directors, Horace Davis, R. C. Harrison, Bernard Moses, E. R. Taylor and J. V. Coffey. The treasurer reported a balance on hand of \$601.15. The following new members were elected: George S. Patton, Los Angeles; John T. Gaffey, Los Angeles; Dr. Paolo de Vecchi, San Francisco; Professor John B. Clarke, Berkeley, and Dr. W. H. Melville, San Francisco.

PORTLAND REDUCTION WORKS.—The reduction works at Portland, Oregon, have started up again on ore from the Sierra Nevada mine, mixed with dry ore from Salt Lake. These works have not been a success so far. The former superintendent left, and the fault was laid to him, whether with truth or not we do not know. It is stated now, however, that if the railroad company will do "the square thing" as to rates, the smelter can be run all right.

THE DEBRIS INVESTIGATION.—The House Committee on Mines and Mining has agreed to report favorably Congressman Biggs' bill, providing for the investigation of the mining debris question in the State of California.

The railroad company is gradually discontinuing the use of coal on the Sacramento division, and is coming back to the use of wood as the best fuel.

## The Proposed Debris Investigation.

The bill introduced by Congressman Biggs of this State provides for a Government commission to investigate hydraulic mining and its effects on the streams. The Supervisors of Yuba and Sutter county, and numerous others, have signed a memorial to Congress opposing the proposed investigation and giving their reasons for the opposition. One of the reasons offered is as follows: "Hydraulic mining being a private industry prosecuted for private gain, in which the Government has no interest whatever, an appropriation of funds for the purpose proposed in the bill is inconsistent with governmental policy."

It may be stated that there are two reasons why this statement is incorrect. The Government is interested in the condition of the navigable streams and the hay, which hydraulic mining is supposed to affect. But, in justice to the miners, the fact must be recognized that they thought their mining land from the Government for the purpose of mining it by the hydraulic system, and that this was well understood when the land was purchased.

Leaving aside the question of the Government wanting the gold from the mines, to coin into money, and other questions concerning this issue between farmers and miners, so much discussed, there is no reason why the Government should not investigate the matter, and see whether or not it has not practically deprived miners of their property without due compensation. Moreover, possibly, a competent commission might be enabled to arrive at some conclusion whereby the mines could be worked without injury to farming lands or navigable rivers. It is an engineering problem entirely. Most of the engineers who have gone into the subject have been partisans, working for one side or the other. An impartial and unbiased commission might be able to settle the vexed question. At least there seems no good and valid reason why it should not try, especially as it will involve no expense to either of the contending parties.

## The Alien Act.

In lieu of the various propositions which have been introduced during this session to modify the alien land law, Senator Stewart from the Committee on Mines and Mining has reported a bill to amend the law by providing that it shall not in any manner affect title to mineral lands or mining claims in the Territories which may be acquired or held under the mineral land laws of the United States; nor to mills or other reduction works or property used in the production of metals from mineral lands in the Territories.

This would, of course, cover the ground the miners require. What they want is to be able to sell their mines, if they can, to English or French capitalists or other foreigners. There are not many Americans of large capital who go into mining in our Territories. They prefer to go into "trusts" and other combinations or deal in railroad stocks, bonds, water stocks, etc. They do not seem to care much for legitimate mining enterprises. Few of our very rich men go into mining on a large scale, and when they do are apt to look more to the profits of dealing in stock than the product of the mine itself.

The English corporations believe more in getting the money out of the mines than the stocks. They therefore employ more men, build more extensive works and conduct their operations on a more legitimate basis than our own companies. They are satisfied, too, with smaller returns. The continuance of the present law will retard progress of the mining industry in the Territories very decidedly. They need all the capital they can get to develop the existing mineral regions. It is unfair to have such a law as at present prevails, when it was never asked for or desired by the mining communities which it affects. The results have been properly explained, and it is to be hoped that Congress will pass Senator Stewart's bill or any other that will give the relief desired.

A COMPANY has been organized at Las Cruces, N. M., to build a railroad to White Oaks, to develop the White Oaks coal-fields.

HUNDREDS of locations have been made at Carson, on the hill where the strike in the artesian well was made.

## Mining in Costa Rica.

E. G. Gaertner, formerly of this city, but for some years past superintendent of La Union mine, Costa Rica, is on a short visit to San Francisco on business connected with the mine. In conversation with him we obtain some facts concerning the mining industry of the region, which will be of interest to our readers.

Costa Rica is comparatively little known as a mining country. The only mines worked there were Aguacate and the surrounding ones, which were opened as early as 1826 and which yielded a large amount of money. The output was estimated by various persons at from eight to twelve million dollars. It would seem strange that Costa Rica should be the only spot on the American backbone void of minerals. Colombia to the south and Honduras to the north are yielding steadily. Of late attention has been called to the deposits of low-grade gold quartz found within the confines of Costa Rica.

The veins are, as a general thing, large, and the vein matter is composed of quartz, lime and talc. The country rock is porphyry. Water and wood for fuel and timber purposes exist in abundance. During the last two years immense strides have been made in developing the deposits, especially in the case of two of the mines—one the Trinidad and the other the Union. Veins of from 20 to 60 feet in width and containing no less an average than \$15 per ton in free gold have been developed. The first one of the above-mentioned mines was sold to an English company for \$300,000 gold, while the other one is under bond to a syndicate of this city for a much larger sum. The situation of these mines is particularly favorable, as they are in plain sight of the ocean and close to an excellent port (Punta Arenas). What retarded the progress of these mines most was the insufficient knowledge of modern machinery and its application by the owners; but of late this has been remedied. Machinery which was formerly obtained in the East is now ordered on the Pacific Coast, which well deserves its reputation. The small difference in price is amply made up by superior quality, and the 60-stamp mill recently furnished by the Union Iron Works of this city may well be called a model of perfection. The Union mine has now 40 stamps and the Trinidad has 60, admitting of an output which will only be equaled by some of the largest mines of this country.

In regard to labor, the ordinary peon gets \$15 a month in Costa Rica money, which is about equal to \$10 gold. The miner gets from \$20 to \$23 silver, which amounts to much less in American gold. The mines are opened by adit entirely, and no pumping works are required. Although the country is very thickly wooded and very broken, and from the Union north toward Nicaragua without any habitations, the country would be a fertile field for prospectors, inasmuch as in the limited space with which Mr. Gaertner is familiar he knows of at least a dozen auriferous veins, each one of them paying from \$10 to \$12 on the surface.

The climate is very healthful; the elevation of the mines is about 2000 feet above the level of the sea. Any one can take up a mine there, and the first discoverer is given the right to two claims, each 200 meters in length. Land for water-right or timber purposes can be bought from the Government at a very reasonable rate. A tract of 2500 hectares (6500 acres) is reserved by the Government for the benefit of the mining community so that they can catch the timber, etc. This is done in each mining district. All machinery and articles necessary for mining are admitted free of duty.

The security of the country is such that the

Union Company have been enabled to send their gold in quantities of upward of 25 pounds by one man without arms or escort—in fact, a highway robbery is a matter entirely unknown. Mr. Gaertner says he has seen something like \$200,000 in silver brought down in ordinary boxes and as ordinary freight.

Provisions such as the country produces, beans, corn, rice, etc., are cheap and easily obtained. Articles of luxury, however, are taxed by a considerable import duty. Connection with San Francisco is made by means of the Pacific Mail Steamship Co., two steamers southward and one northward each month. The mines are about 25 miles from the port of Punta Arenas.

There are no custom-mills in the country. There is only one other mine besides the two

## The Boss Amalgamating Pan.

The pan used by M. P. Boss, in his Standard continuous mill, and shown in the accompanying engraving, differs but slightly from the combination pan in general principles; the cone is larger in diameter and the steam chamber extends into the cone, thus increasing the heating surface.

The great difference from the ordinary pan is in the manner of taking power. The Boss pans are not driven by belts, but are directly connected with the line shaft by beveled gearings. The spur-wheel has a long hshbitted hub and is fitted to run loose on the line shaft; back of the teeth it is fitted with an expansion ring of malleable iron. This ring is held in place by pins which are threaded into the expansion

SECTION OF M. P. BOSS' STANDARD PAN.

mentioned belonging to private companies. There is a little work done by astras. Both of the mines are gold mines, with no silver, and but a trace of lead.

**A NOTABLE REMOVAL.**—The old-established house of John Taylor & Co., assayers' materials and mining supplies, have taken the large corner store in the Donahue building, corner First and Mission streets, and the Union Iron Works have taken offices on the same floor with them. This is another move to Mission street and shows a tendency of the wholesale trade to drift in that direction. As the north side of Market is already built up with business blocks and extended out as far as Eighth and Ninth streets, the spread would naturally be toward the south and Mission and the cross streets in that direction, and with new modern structures must make this section desirable.

ring, but fit loosely in the pinion-wheel.

The collar of the pinion-wheel, which is under the expansion ring, has two radial arms, the ends of which are fitted with shoes having the curve of the expansion ring. These shoes have a brass bushing to prevent wearing.

The shoe is connected with the collar by a toggle, which is worked by a lever running up through the pan floor. By means of this lever the shoes are made to engage the expansion ring, thus forming a friction clutch and communicating motion to the spindle of the pan.

The shoe of the friction clutch is adjusted by means of bolts set in the toggle.

THERE were shipped from Calistoga, Napa county, 729 flasks of quicksilver last month. The Sulphur Bank mine produced 274 flasks; Napa Co., 235; Bradford, 159; and Great Western, 61.

## Mining Stocks and Mines.

It is notable that with the increase in importance of the mining industry comes a corresponding decrease in the importance of mining stock exchanges. With an increase of product from the mines comes a decreased volume of sales of mining stocks.

Last year the mines of the United States produced more bullion than ever before. Last year saw the inauguration of two new mining-stock exchanges, one at Portland, Oregon, and the other at Helena, Montana, and both of these were failures. The mining-stock business in New York is insignificant, and in this city it never made a poorer showing than at present.

The truth is that legitimate mining—working the mines for their product—has gradually crowded out the stock-jobbing feature. The actual value of a mine in no way depends on the quotations of its stock in the exchange. In fact there is scarcely one of the good mines of California that is even listed or called at our exchange board. What little dealing there is, is in the stocks of Nevada mines mainly, and even there the mines are daily becoming more and more independent of stock-board influences.

In fact, the public some years since learned the lesson of keeping out of stocks. Not one man deals in them now, where there were hundreds years ago. The manipulations of the insiders were such that "outsiders" had little chance of making any money. But the dodges and tricks are all pretty well known now, so there is scarcely business enough for the brokers to pay office rent and clerk hire.

If the listing of a mine on the board was any guarantee of its value, it might be different. But no experts of the board make any examination, and nothing is exacted but a listing fee. As a result, all sorts of wildcats have been listed, and the best mines are not heard of in stock circles.

The evils of stock gambling have been enumerated time and again. It does not matter whether stocks represent mines or anything else, but with mines there seemed more chance for forcing fluctuation and consequent speculation. The original idea was well enough when the mines were supposed to be developed by a number of people who paid or received profits in proportion to the interest held. But the whole thing finally drifted into a gamble. A few men were made very wealthy and a very great number were made poor.

It is not probable that the lost position of the mining-stock exchanges will ever be regained. And it is well that it is so. There is plenty of money to be made in mining when the business is properly followed, but the stock system has not realized its mission in developing mines. The people have found this out and care to follow it no longer.

**NOT IN CONTEMPT.**—In the matter of the alleged contempt of the Omega Mining and Ditch Company in violating the decretal order of the United States Circuit Court in the famous debris case of Woodruff against the North Bloomfield Gravel Mining Company which was referred to S. C. Houghton, Master in Chancery, to take testimony and report the finding of facts and conclusions, the decision of the Master was filed exonerating the defendants. He decides that the prosecution failed to establish the offense charged.

**TOPOGRAPHICAL CAST OF SAN DIEGO.**—Mr. Isaac Winston has recently completed a plaster cast showing the topographical features of San Diego and vicinity. It is about six feet square and weighs 700 pounds. The horizontal scale is six inches to a mile, and the vertical scale is exaggerated as is usual in these casts. San Diego, the bay, Point Loma, Coronado beach and a portion of the ocean are shown. The work is well done, and the cast gives an excellent idea of the locality.

THERE is a prevalent rumor that an agreement has been arrived at between the Grand Central and the Contention Mining Co., Tombstone, A. T., to put in new pumping machinery jointly in the Contention mine, which is now lying idle, owing to the inability to handle the water. When it shut down the mine had nearly 200 men on its pay-roll.

THE fire in the Calumet and Hecla mine is still burning.

## MECHANICAL PROGRESS.

## Decay of Iron—Groton Iron.

A short article in a recent number of the *Industrial World* says that the statement has recently been made by a practical iron-worker of 50 years' experience that not only does that metal rot from age, but that continual jarring has the effect to weaken its tensile strength, an illustration of a familiar kind in this line being afforded by the step of a carriage, which, when new, may be bent back and forth without breaking, but after a few years' service will certainly break, no matter how well preserved.

This same loss of tensile strength is noted in carriage springs; the poorest may be safely relied on for a year, but even after that short time they begin to break, and those, too, of the best quality will break after years of constant and exacting service.

It has been found that old crowbars, made of the best Swedish iron, and used by the early settlers of New England, have become so rotten that they could not be welded when broken, and had an offensive smell when the welding heat was applied.

Formerly, all iron was wrought by the trip-hammer, which scattered all the brittle and worthless material, but rolling makes it possible to run bars through containing poorest stock.

The *World* is slightly mistaken, however, in the statement that the old crowbars were made of "the best Swedish iron." On the contrary, the iron was mined and manufactured in the town of Groton, Mass., the site of the forge and furnace being recognizable to this day.

It is a well-established fact that iron becomes crystallized by continuous jarring and hammering; car axles are condemned after being in use for a certain length of time, and cannon are thrown aside after being fired a certain number of times.

The peculiar odor described above as an "offensive smell," emitted by the "old" iron at a welding heat, is characteristic of "Groton" iron. It is probably caused by certain chemicals combined with the iron, probably sulphur, and perhaps phosphorus.

In welding this iron great care has to be observed, and so much skill is necessary that it is regarded as a test of excellence, among the local smiths in Massachusetts and New Hampshire, to be able to "weld Groton iron." The peculiar odor of the iron much resembles that of a striped snake when the reptile is made angry. To weld the iron a good heat is necessary; then lay the pieces together carefully, press with a heavy hammer without striking, or squeeze the two pieces in a vise. This treatment will usually cause them to "stick," and the work may then be reheated and the weld finished up in the usual manner.—*Manufacturer's Gazette*.

## The Effect of Repeated Heating on Iron.

A. Elink Sherk of Haarlem, Holland, writes to *Engineering* on an accident which involves a very interesting point:

In September, 1885, an iron chain was hung over a sheave in and at the top of the chimney of a pumping engine of the drained Haarlemmer lake. By this chain a man had to be hoisted up now and then to the top, about 92 feet high. The chain was of 5 16 inch iron, and furnished some days before it was hung by one of the best-reputed Dutch chain manufacturers, who declared, by writing, it was tested to 2970 pounds. It was a relatively very expensive job, as we paid \$10 per cwt., but money was thought to be of no account in a case where a human life depended on good material and workmanship. In the past month of September, i. e., "two years after the chain was hought and hung in the chimney," one man, sitting in a little wooden chair, was hoisted up. When he got about the middle of the height the chain suddenly gave way and the man tumbled down. Most fortunately he was not killed, and not even seriously hurt. On examining the broken chain, I found it to be neither worn nor rusty; but, besides the links that were broken in pieces, several others had burst quite through in the same manner as cast iron does. The iron of these links is very brittle, and shows on the whole surface of the fracture no fiber at all, but a flat crystalline plane of a not very coarse grain and a high brilliancy. When it was asked of the manufacturer how he could warrant for 2970 pounds a chain that was broken under a charge of some 160 pounds, this gentleman answered: The chain had been quite right, but, hung in a chimney, "it was impossible it should keep well, for, when perpetually cooled down after being heated without any working (hammering) the iron gets loose and hard, and consequently it is easily broken."

As for this "perpetually cooled down after being heated," I have to observe the highest temperature in the chimney (at its bottom) remains between 630° F. (melting point of lead) and 680° or 750° F. (melting point of zinc). The chain has been exposed 35 times to this heat, and as many times it has cooled down to the temperature of the surrounding air. It is unknown to me, and, as I discover now, to many others, that good wrought iron may be completely spoiled in the circumstances I mentioned. The chains hanging in the chimneys of our other engines, now already four and five

years, though heated and cooled down in exactly the same manner, do not show traces of brittleness or weakening; but we got those chains from another person; they were not warranted, and not nearly so expensive. Still, if the manufacturer of the broken chain is right, if good wrought iron may indeed lose some 95 per cent of its tensile strength under circumstances such as I have described here, this fact is well worth making generally known, in order that accidents might be prevented.

**BRITTLE IRON.**—It is well known to artisans engaged in the working of wrought iron that if a piece of the very best and toughest iron is hammered in the process of forging until it ceases to be red hot, the effect of such cold hammering, as it is termed, is to cause the iron to become so brittle that it will in many cases break across in the process—or if it does not at that time this process of cold hammering so removes and destroys its tenacity as to render it capable of being broken with the slightest blow. In remarking upon this process, Mr. Nasmyth, a well-known authority, has lately expressed the opinion that, though such a practice is by no means to be considered inherently wrong, but just the reverse, the evil rests in applying such a cold-hammered piece of forge work to its purpose without having been passed through the curative process, which is simply this, namely, to heat the piece of work in question to a dull red heat, and lay it down to gradually cool. By subjecting wrought iron to the most violent hammering or compression at a low temperature, and then submitting the iron work so treated to the simple process referred to—heating red hot and slow cooling—the tenacity or shock sustaining qualities of the article are enhanced at least 20 times. In most cases the process in question of hammering and a softening is necessary, in order to insure the requisite finish and nice surface, the forgings so treated requiring, too, the least possible labor subsequently.

**LUSTERLESS SURFACE ON STEEL.**—A finely polished lusterless surface on tempered steel can be procured by either of the following operations: After the steel article has been tempered it should be rubbed on a smooth iron surface with some pulverized oil-stone until it is perfectly smooth and even, then laid upon a sheet of white paper and rubbed back and forth until it acquires a fine dead polish. Any screw-threads or depressions in the steel must be cleaned and polished beforehand with a piece of wood and oil-stone. This delicate lusterless surface is quite sensitive, and should be rinsed with pure soft water only. A more durable polish is obtained by first smoothing the steel surface with an iron polisher and some powdered oil-stone, carefully washing and rinsing. Then mix in a small vessel some fresh oil and powdered oil-stone, dip into the end of this mixture the end of a piece of elder pith, and polish the steel surface with a gentle pressure, cutting off the end of the pith as it commences to become soiled. In conclusion, it should be thoroughly cleansed in soft water, when the article will be found to have a fine white, lusterless polish.

**REPAIRING WHEELS.**—In repair shops we sometimes have wheels of family carriages and other valuable light wagons brought in for repair. These wheels are good in almost every respect except that the spokes are slightly loose in the hubs, the cause being the driving of the wagon with the tires loose. To repair such wheels and make a good job, remove the tires and rims, then fasten the hub on the wheel top, draw out the spokes, and if any of them are crooked put them in an oven or some place where you can warm them slowly. When warmed as hot as they can be without injuring the paint, take them to the vise and straighten them; when they are cold they are ready to be driven back in the hubs. Use good glue, and if any of the spoke tenons seem to be too thin, cut a piece of canvas the width of the tenon and use as many thicknesses as are needed to fill the mortise. Be sure to allow the wheels to stand undisturbed until the glue is thoroughly hard before driving on the rims. When the rims are on, set the tire in good shape, and the job is completed.—*Blacksmith and Wheelwright*.

**A MACHINE FOR TESTING RAILWAY TIRES.**—One of our foreign exchange illustrates and describes a machine for testing steel railway tires by percussion, in use at the works of the Chemin de Fer du Nord, at La Chapelle, Paris. The object of the machine is to give a succession of blows like those of a sledge-hammer, but in quicker succession, more regular in point of interval, and more uniform in intensity. To this end a pair of wheels with their tires shrunk on end keyed on their axle is made to revolve slowly on live rollers, while a couple of sledge-hammers are brought down on the tires at regular intervals by a motion like that of the old tilt hammer, a pair of hammer springs being interposed for giving elasticity to the blow.

**ENLARGING A TIRE ON A WHEEL.**—A correspondent of the *Blacksmith and Wheelwright* says he has done it in the following manner:—"Drive the felloe out so that a little more than half of the face of the tire shows for a few inches in length of the tire. Take a small fuller and a hand hammer, set the tire on the anvil, draw one edge of the tire, drive it through to the other side and draw the other edge, but do not draw too much or your tire will be loose."

## SCIENTIFIC PROGRESS.

**IS TYPE-WRITING TO SUPERSEDE TELEPHONING?**—A machine which has been named "dynamograph"—an electric type-writer—has recently been patented at Washington and pronounced by one of the Patent-Office examiners as one of the most important of recent inventions. The instrument in appearance somewhat resembles an ordinary mechanical type-writer. It has a key-board, and the types are placed on steel bars, which play upon a common center, as is the case with the type-writer. The motive-power used is electricity, by means of which evenness of action is assured. No matter how heavily or how lightly the keys are struck, the impression on the paper is the same. A remarkable feature of the invention used as a type-writer is, that the carriage moves automatically both forward and backward. When the end of the line is reached, the carriage returns to the starting-point without the aid of the operator, and the paper bar moves one notch, so that all that is required of the operator is to depress the keys. The most important field for the new invention is said to be in connection with the telegraph, since the instrument can be used both as a transmitter and receiver of intelligence over a single wire, no matter how great the distance may be. The receiving instrument does not require the attendance of an operator, but prints the dispatch automatically. The instruments at both ends of the line print the dispatch sent, and so a safeguard against mistakes is provided. It is said that the electrical type-writer will be valuable as a local aid to business, and offers many advantages over the telephone. One advantage put forth is, that no matter whether a person called up is at his place of business or not, the message can be printed through the medium of his type-writer, and will be there for personal on his return. The dispatches printed are in letter form and not on endless tape.

**THE NEW GLASS FOR MICROSCOPES,** to which we have already made several allusions in these columns, is still attracting much attention, and seems to be producing remarkable results. This glass possesses so high a refractive power as to be rid of what is known as the secondary spectrum lenses, and therefore does away with that confusion in the focus which formerly existed in the best lenses. Employing these new lenses, Dr. Dallinger, an eminent English naturalist, states that he has been enabled to discover a remarkable organism, which is endowed with six motile fibers, and which acts as a sort of gleaner in the putrefactive fluid, the object of the existence of these organisms, he says, in the putrefactive fluid being to break up the decomposing animal and vegetable matter into its original elements with carbon, hydrogen, nitrogen and the rest, in order that, set free, they may go again to the building up of organic forms. This organism, it appears, lingers in what has hitherto been considered an exhaustive liquid to break up the minute particles still left, and to this end is endowed with an extraordinary power of motion, this being partly grinding and partly impact with motion; a group of these organisms can be observed about a minute speck of decomposing matter, rapidly breaking it up, until it has wholly disappeared. Dr. Dallinger also says that he has been able, by the same lenses, to make discoveries on the obscure but important question of the existence and meaning of the nucleus in these minute organisms, demonstrating, in fact, that every important change taking place in the organism, from its earliest development to its latest phase, was preceded by profound changes in this exquisitely minute nucleus.

**ARTIFICIAL SILK.**—M. De Chardonnet dissolves 3 grms. of nitro-cellulose in 100 to 150 c. c. of a mixture of equal parts of alcohol and ether. He adds 2.5 c. c. of a filtered solution at one-tenth of the dry ferrous chloride of commerce in alcohol, or of stannous chloride, and further 1.5 c. c. of a solution of tannic acid in alcohol. The whole is filtered in a closed apparatus to prevent loss by evaporation. The liquid is placed in a vertical reservoir, having at its bottom a blowpipe nozzle of glass or platinum. This pipe forms an acute cone with an orifice of from 0.10 to 0.20 mm., the thickness of the margin not exceeding 0.1 mm. This aperture opens into a vessel of water acidulated with one-half per cent of mono-hydrated nitric acid. The level in the reservoir being some centimeters higher than in the vessel of water, the outflow proceeds easily. The fluid thread hardens at once in the acidulated water, and may be drawn out by a uniform movement. The thread thus formed must be dried rapidly by traversing a current of dry (not hot) air, and may be wound up as soon as dry. It is gray or black, but a number of soluble coloring matters may be introduced into the ethereal solution, thus obtaining threads of all colors.

**"BLIZZARD."**—The term "blizzard" has been quite generally in use in various parts of the country for many years, and we can see no good reason why it should not be found in Webster's unabridged. An exchange gives the following as the origin of those peculiar "cold waves" which have recently swept over our northern border with such terribly destructive effect: "The blizzard" originates somewhere far up within the arctic circle and sweeps across British North America, through a sort of funnel formed by the Laurentian mountains on one side and the

Huronians on the other, rising in some parts 4000 feet, while on the Saguenay river the gorges form sheer cliffs 1500 feet high. The blizzard strikes against the western limit of this rocky barrier and is deflected so that in Wisconsin, Eastern Minnesota, Michigan and Illinois its force is broken. From that point, and the Rockies and Sierras further south, there is an unbroken plateau to the Gulf of Mexico, where the blizzard disports itself unchallenged. South of the mountains the Arctic currents are less severe. Manitoba is only a mid-station in its career.

**FINE RULING.**—Dr. H. A. Rowland of Johns Hopkins University has a new machine for ruling his glass plates for spectrum analysis or decomposition of light, which will inscribe 40,000 lines to the inch. The machine which he has heretofore used would rule only 10,000 lines to the inch. The ruling is done by a small diamond point which runs across and draws the line while the plate is stationary. It is a matter of infinite care, and several days are necessary for ruling a plate three or four inches in diameter. At the end of the engine is a small counting-machine for recording the number of lines drawn. In an adjoining room is a very costly instrument for measuring the width of the lines, and so marvelously accurate is it that an error of one-hundred-thousandth part of an inch, or even less, can be detected. The rulings of this machine are the finest in the world. This engine was made entirely at the University under the personal supervision of Mr. Rowland, and is the result of the most careful, painstaking effort. The most important part of it—the screw and its attachments for regulating the width of the lines—was carefully ground under water kept at a constant temperature, so as to avoid all error arising from expansion and contraction, and is guarded against so small an error as one-hundred-thousandth part of an inch. The engine is run by water-power, and is inclosed in a glass case, and kept in a double-walled brick chamber in the basement, so as to provide as equable temperature as possible. So delicate is the machinery that while it is running the case is kept closed, as the heat from a person's body would affect it.

**UTILIZING ELECTRIFIED BALSAM.**—According to *Engineering*, Mr. C. V. Boys has described an interesting experiment he has made with electrified gums and balsams. If sealing-wax or any such sticky material is melted in a cup and put on the conductor of an electrical machine, it throws out threads and fibers, which break into heads. The cup containing the gum should be inclined from the operator and the electrical machine before the latter is worked, else both will be covered by an invisible sticky web. Burnt india-rubber also sent out the filament; but Canada balsam appears to show the phenomenon best. When a candle flame is held near a cup throwing out such filaments they shoot to the flame and sometimes cover the candle, and sometimes discharge into the flame and turn back into the cup. In a few minutes a large quantity of these sticky threads can be made, and, as they break into heads, Mr. Boys points out that this plan can be used to pulverize these substances, which are not easily pulverized in the ordinary way.

**NOCTURNAL PHOTOGRAPHY.**—Various methods have been introduced for the accomplishment of nocturnal photography, and some of the most beautiful landscape views taken at night by the light of the full moon have been produced in France, the time of exposure of the plate being one hour. The clearness of the photograph is wonderful, and, except for the lights in the buildings and on the bridges, and their reflections in the water, the picture could hardly be distinguished from one taken in the daytime.

**A NEW INSULATING COMPOSITION** has been brought out by Mr. N. W. Merritt of Somerville, Mass. It is flexible, fairly tough, and unalterable by moderate changes of temperature. It is made by adding one quart of water to two pounds of sodium silicate; with this is mixed one pound of tar and the whole heated. While hot, four pounds of asbestos waste and one ounce of sugar are stirred in, and a little dilute nitric acid added, which completes the operation.

**PHOTOGRAPHIC METEOROLOGY.**—M. Janssen, the French physicist, considers the camera a valuable addition to the instruments of the meteorologist. He has exhibited to the Academy of Sciences some fine pictures illustrating the characteristics of mountain clouds at the different hours of the day. The "sea of dawn" of early morning undergoes interesting changes through the action of air currents set in motion by the sun.

**ONE OF THE SEA'S DANCOERS.**—A curious acoustic phenomenon, sometimes observed at sea, has been termed by M. Fizeau the "mirege of sound," from its analogy to certain well-known phenomena of light. The sound-waves are deflected upward to a very marked extent under the influence of strata of air of various temperatures, and to this effect are ascribed numerous collisions between vessels having powerful fog signals.

**THE GASTRIC JUICE.**—Dr. Buhejinski of St. Petersburg has found that the gastric juice is less acid during sleep than at other times.

## ENGINEERING NOTES.

## A Gigantic Undertaking.

## A Proposition to Bridge Over the English Channel.

The *Evenement*, an influential French journal, says that there is a scheme for bridging the English channel under active consideration among French capitalists. Admiral Cloué is at the head of the project, and has connected with him three well-known engineers, Messrs. Hersey, Fowler and Baker, the two latter representing England in the matter. The plans have already been prepared, and are at present being examined by skilled engineers at the Crouxot works. As the *conseil supérieur des ponts et chaussées* is not unfavorable to the scheme, as soon as the plans are approved active measures, it is expected, will be shortly begun. It is estimated that the cost will be somewhere about \$200,000,000, and the time required before it can be completed seven years or more. The course proposed to be taken for the bridge is from Cran-sax-Élofs, a little place on the French coast between Ambleteuse and Cape Gris Vert, to Folkestone, on the English side, a distance of about 22 miles. Not the shortest, but the shallowest line will be chosen. The depth of the channel is supposed to be much greater than it is in reality. There are two shallows between the two points where the depth is only about 20 feet, and they will, of course, make a material difference in laying the foundations. From the French coast to the first of these shallows the depth is about 160 feet, and from the other shallow to the Folkestone about 100 feet. The bridge will have two slight bends, the first deviating a little to reach the Wans, the other falling back to reach Folkestone.

Huge piles will be required for the support of this great structure. The piles proposed will be blocks of concrete and masonry 100 feet long by 100 feet broad, and will be placed at intervals of about 550 yards. The measurements sound enormous, but it is stated to be quite possible that they may have to be increased to give the bridge a strength capable of bearing a weight of 25,000 tons. The causeway of the bridge will be about 160 feet above the sea level, so that vessels of any size may be able to pass beneath it. It will be 100 feet wide and be divided into four lines for train service, as well as a way for foot passengers. Signal-boxes and sidings will be placed along the whole length at equal distances. The bridge will be illuminated by electric light, each pile having a powerful electric lamp attached to it, as well as fog-horns and alarm bells for use in foggy weather. Such are the outline details of this enormous undertaking, which the projectors state they have full confidence will be before long carried out. The *London Times* gives the particulars of the scheme without any special comment pro or con.

**RUSSIA'S GREAT RAILROAD.**—Russia has just positively resolved to undertake one of the most colossal railroad enterprises of this generation. Next spring work will be begun on an Asiatic trunk railway, to stretch from Tomsk across Siberia to the Pacific by way of Irkutsk, Strélnik, Khenkat or Hankoi to Vladivortok. The work is expected to be completed in five years. Communication between St. Petersburg and Ekaterinenburg is already established, and a line to Timmen is in progress. That covers only about one-third of the distance, and from Timmen the line joins Tomsk, above alluded to. The work of construction will be carried on from both ends. The line will be of great advantage in developing the resources of Siberia, and it will enable travelers to cross from the Pacific to St. Petersburg in something like 15 days. Much stress is laid on its strategic importance, giving, as it does, a chance by the transport of troops to cover the Chinese frontier. That in the meantime the introduction of Russian petroleum into Eastern countries will be pushed with renewed energy and perseverance is certain. The struggle between the American and Russian articles in that direction will thus receive great impulse, and we do not fail to point this out to the petroleum trade, as the fight is likely to be a close one.

**THE BRIDGE OVER THE STRAITS OF MESSINA.** To give railroad connection between Italy and Sicily, appears to be taking practical shape. The place selected for this great undertaking is where the channel is some 2½ miles wide and 361 feet deep. Two piers will support the viaduct or steel rails at the height of 328 feet above the water. If this work and what may be called its companion-work across the English channel are ever completed, they will constitute the two most wonderful works of engineering ever attempted.

**COMBINING THE ELEMENTS.**—One of the latest attempts to harness the forces of nature for the service of man is the adaptation of a wind-mill for the turning of a dynamo, the electricity thus obtained being stored in suitable batteries and afterward used in lighting basons for the benefit of the maritime interests. There is a station of this kind near the mouth of the Seine, and considerable success has been obtained.

**THE MINING AND SCIENTIFIC PRESS** for Feb. 4th is a valuable number. It devotes many pages to a thorough summing up of the mining interests of the coast. Wood River is awarded the prominence due to it.—*Hailey Inter-Idaho*.

## GOOD HEALTH.

## Cure for Dandruff.

**EDITORS PRESS:**—One of your "Constant Readers" asks for a dandruff cure. If the directions I am about to give be faithfully carried out, dandruff will disappear at short notice. My wife being troubled considerably that way, I applied to Dr. L. W. Case, professor of skin diseases at the Rush Medical College of Chicago, and he prescribed as follows: At night before retiring rub the scalp, in fact, saturate it with oil (hair oil, lard, olive oil), anything will do. Spend 15 minutes in rubbing it well into the scalp, tie a towel around your head and retire. Next morning wash the scalp with sulphur soap thoroughly, then rinse off every particle of oil and soap with clean, warm water, rub dry and comb. After the head is perfectly dry and all soap and oil have disappeared, make a mixture of four ounces of rose-water, one ounce of glycerine and five drops of carbolic acid, and use this once a day for a week, in place of hair oil, rubbing well into the scalp, and thereafter as often as you like in place of other hair oil, but not less than twice a week. This mixture can be perfumed to suit. Friction keeps the scalp healthy, and at least five minutes should be spent every morning rubbing the head with the tips of the fingers. If these directions are followed, dandruff will disappear and the hair will stop coming out. Wash the head once a month with sulphur soap, after saturating with oil the day before.

Chicago, Ill.

WILLIAM WEINER.

## Car Fumigation.

The *Oakland Enquirer* in the following article describes the precautions taken by the railroad people to prevent the spread of smallpox on all their local trains at the Oakland point:

During the recent smallpox scare in San Francisco and Oakland a general system of fumigation has been quietly going on upon the incoming local trains of the railroad company, but so little has been said about it that few persons outside of the railroad employ are acquainted with the manner in which the process is carried out. A small tin pail, equal in size to the common lard-bucket and mounted upon four short legs, is placed in the car to be fumigated. The bottom of the pail is then covered with a coating of plaster of paris to the thickness of 1½ inches; over that one-fourth of a pound of sulphur is sprinkled, a little alcohol is applied, and a match touched to the latter, which instantly sends up for the space of half an hour such strong and penetrating fumes as to cause all present to vacate and remain outside the car while the process is going on. At the end of the half hour the car-doors are opened, and as soon as the fumes have escaped the car is thoroughly cleaned, swept and dusted, leaving no trace of the burning sulphur behind.

When, however, a suspicious and extraordinary case is reported upon a train, the car wherein the case was found undergoes a much longer and more vigorous process than the first. In the latter case a paste composed of equal parts of manganese and common salt is made and placed as before in the little pail, over which is then poured 90 per cent of sulphuric acid, which develops chlorine gas. The preparation is decidedly the most thorough in its effects, although being highly detrimental to the silver and plated finishings and ornaments contained in the car, and is only used, as before stated, in exceptional and urgent cases.

**HEALTH HINTS.**—A man had a finger nail torn off, causing very great pain; brown sugar was thrown on a pan of burning coals, and the finger held over the smoke for 20 minutes. The pain was removed, and in due time a cure was effected. In *Health at Home* it is narrated that a horse seemed to be dying of a festering wound. Some old shoes were put up in a hog-troth and set on fire under the horse, so that the smoke would reach the wound. In a few hours the swelling began to subside, the wound discharged, and the horse got well. An old lady was knitting a stocking. A member of the family came in with a painful wound. She unraveled the stocking, put the yarn on a shovel of burning coals, caused the smoke to ascend against the wound, giving immediate relief. The first thought of ordinary readers is that of wondering that such a "simple" thing should have such beneficial effects. Instead of burdening the mind with the remembrance of old leather, and brown sugar, and yarn stocking, it is better to ascertain the general principles; for one may have the most agonizing sore, and be a thousand miles from an old shoe, or spoonful of brown sugar, or a yarn from a stocking. What then? In all cases there was smoke; out of smoke creosote is made, and carbolic acid is of the same essential nature, hence the application of these useful substances to all varieties of wounds, burns, and sores. Their essential nature is two-fold—they arrest decay and purify.—*Hall's Journal of Health*.

**THE OBJECT OF COOKING THE FOOD** is to dissolve the adhesive substance which binds the fibers of food together, so that the digestive fluids can the more readily act upon every part of the food. "The starch granules of corn, wheat, rye, and other grains, with those of the potato, turnip, and other vegetables, are very difficult of digestion in a raw state. The digestive fluids act upon them slowly and only

with great difficulty, owing to their insolubility. When subjected to heat, these granules swell very greatly in size, and rupture, when they become easily soluble. This effect of heat is familiarly illustrated in the parboiling of corn, the effect upon the whole kernel being due to a similar effect upon each individual granule. The indigestibility of raw fruits is due to unruptured starch granules which they contain; hence they are improved by cooking."—*Pacific Journal of Health*.

**THE INDIAN AND PHYSICAL PAIN.**—The general idea that the Indian endures pain stoically is not sustained by the observations of Dr. Corbier among the Apaches. He says that "they do not endure physical pain any better, if as well, as the whites. Great or continuous pain renders them stupid, and oftentimes delirious, and the stolidity with which Indians in general are credited is not well maintained by them under small surgical operations, the ones of tooth-extracting almost always eliciting a groan or a yell."

**DO YOU SMOKE?**—Hundreds of boys, says the *Scientific American*, apply for enlistment in the United States Navy, but are rejected because they cannot pass the physical examination. The first question is, "Do you smoke?" The invariable response is, "No, sir;" but the tell-tale discoloration of the fingers at once tells the truth.

**ALCOHOL AND WAR.**—We spend hundreds of millions a year for alcoholic drinks as a luxury, and by it send more people to the grave in one year than are carried thither in ten years of war.

## USEFUL INFORMATION.

## Correcting Dents and Soars.

Fine surface painting on wood is liable to accidents, some of which compress the wood without breaking the layer of paint and varnish, others scar the varnish without reaching the wood, and still others dig deeply into the wood. Wheeled vehicles require to be handled by three branches wholly different from painting, and therefore are very liable to meet with accidents through the carelessness of tools. Indeed, it is a rare thing for the carriage painter not to have to patch up one or more bruised spots. The dent, when but slight, may be corrected by acting on the natural property of the wood for shrinking and swelling under the effects of heat and moisture. The force of the blow having been only sufficient to compress the fibers of the wood, the introduction of moisture to the part will cause the grain to swell or assume its former place. A fine needle is used to pick a few holes in the dent and the part is then sponged over with water, which will soon cause the wood to rise.

Scars which do not reach the wood but still tear deeply into the varnish are ugly things to correct, especially so in finishing coat, and if the time can be allowed the better plan is to rub the entire panel, so as to bring its surface to the level of the bottom of the scar. After the rubbing has been carried as far as it is safe to go without reaching the color and the scar is still visible, it should have a coat of varnish, which, when dry, is to get a careful rubbing. A heavy coat of varnish on the panel will restore it.

The above way is to avoid puttying and coloring the bruised place, as it is so difficult to get a perfect match of the underlying color.

Deep bruises require that the broken fibers be removed and the wood primed, puttied, and filled up to the original level. The putty should be in two or three layers, allowing time for each layer to harden, the last layer to be mixed in varnish so as to bear rubbing with lump pumice-stone, the rubbing to be confined to the size of the bruised place, so as to avoid scratching the varnish more than is absolutely necessary. When rubbed to the proper level, wash clean, dry off and carry the bruises into the varnish, and, when dry, rub the panel and revarnish. Bruises over black, opaque-green and brown give much less anxiety than when a transparent color lies beneath the varnish, for the latter is difficult, we may say impossible, to match perfectly, and the only recourse is to repaint the panel.—*Painters' Magazine and Coach Painter*.

**MACHINE TOWELS.**—The American Silk Mfg. Company of St. Louis, Mo., are supplying the market with what they call machine towels, manufactured out of silk-waste. Cotton-waste, rags, litter, hemp, fiber, etc., the regular material used up to the present time, have disadvantages not only to the laborer, but likewise to the machines. Cotton-waste, when saturated with oil, easily inflames, and carries therefore with it constant danger of fire, besides being most lavishly used, as no traces can be kept of it. Rags and litter are objectionable on sanitary grounds. All of above-named materials lose more or less small particles of fiber by friction, which work into the finer parts of the machinery and in time affect them seriously. The machine towels, on the other hand, are claimed to entail no danger of spontaneous combustion, even if piled up in a heated and oily condition. They are further claimed to leave no fiber on any part of the machinery, to be superior for their softness, elasticity and capability of easily absorbing any greasy substances, and to possess the property of taking up and retaining in their meshes any rust or

particles of foreign matter with which they come into contact. We understand that they can readily be washed over and over again without losing any of their properties. The control is easily established by giving a certain number to the men, who have to return them after use. The general size of the wipers in demand is 14 inches square, though they can be furnished in any size desired. The washing, which enables the using of the wipers from 10 to 15 times, is done by allowing the greasy wipers to lay over night in a weak solution of lye and soap, to be rinsed out next morning in hot water. A simple boiling of the wipers in soda is also recommended.

**A STEEL STREET PAVEMENT** has recently been laid on Jackson street, Chicago, between Clark and La Salle streets, by the Iron Paving Company. It consists of steel strips about 2½ inches wide and one inch thick, rolled with a channel on the side exposed to traffic, and with notches about six inches apart. These strips weigh 11 pounds to the yard, and they are laid across the street about five inches between centers. The strips are only long enough to extend to the middle of the street, so that the proper slope from the center to the gutters can be secured. They are bolted together so that they cannot slip laterally, and are fastened to wooden sills. A bed of gravel composes the support for this pavement, while between the steel strips a mixture of pitch and cement is poured, which fills the interstices to a level with the tops of the strips and renders the pavement comparatively smooth. The paving company claim that experiments which they have made demonstrate the suitability of this pavement to city traffic. Its cost is a little less than the usual charge for paving with granite blocks.

**CURIOUS EXPERIMENTS.**—Some curious experiments have led Dr. Urbanschtich of Vienna to the conclusion that the exciting of one sense organ increases the acuteness of the others, the different sensations seeming to reinforce one another. Hearing a sound will bring out the just indistinguishable color of a distant disc. The ticking of a watch is heard more plainly with open than closed eyes, the fact that we listen to music or speaking with the eyes closed being due to other reasons. The sight of red and green increases perceptions of sound; that of green and red weakens them. These colors affect sensations of smell, taste and touch in like manner. Touch and temperature act reciprocally. When the skin is tickled and plunged into warm water, the tickling ceases; when into cold, the tickling brings out the feeling of cold. These observations offer an explanation of the singular associations between colors and sounds that some individuals retain.

**LETTER COPYING.**—To avoid the loss of time incurred in waiting the paper when a letter is to be copied, M. Leroy of Berlin has constructed a press with a hollow platform, made into a water reservoir, by the junction of a kind of double bottom in a pierced iron plate. Under this plate is fixed a sheet of felt, then a cloth or some other material; and the water, passing over the pierced iron, soaks the felt and cloth, giving them the proper amount of dampness. To copy a letter it is only necessary to place it under a piece of silver paper and give the press a turn. The moisture is transmitted to the silver paper, and the letter is copied.

**CEMENT TO Mend IRON POTS AND PANS.**—Take two parts of sulphur and one part, by weight, of fine black lead; put the sulphur in an old iron pan, holding it over the fire until it begins to melt, then add the lead; stir well until all is mixed and melted; then pour out on an old iron plate or smooth stone. When cool, break into small pieces. A sufficient quantity of this compound being placed upon the crack of the iron pot to be mended, can be soldered by a hot iron in the same way a tinsmith solders his sheets. If there is a small hole in the pot, drive a copper rivet in it and then solder over it with this cement.

**TO CALCULATE WATER IN A PIPE.**—To calculate roughly the quantity of water in any given pipe or other cylindrical vessel, it is only necessary to remember that a pipe 1 yard or 3 feet long will hold about as many pounds of water as the square of its diameter in inches. Thus: If we have a pipe 20 inches in diameter and 16 feet long, we have simply to square 20 (20² = 400), and multiply the result by the number of times 3 feet is contained in 16 feet = 5½ times; hence, 400 × 5½ = 2133 pounds. By increasing the result by 2 per cent, or 1-50, a more nearly exact figure can be obtained.

**A ROADBED OF SALT.**—In the Colorado desert, near Idaho, there is a large bed of rock salt, and the Southern Pacific railroad, in laying the track to the salt bed, has been obliged to grade the road for 1200 feet with blocks of these crystals. This is the only instance where the roadbed is laid and ballasted on salt. The sea, which once rolled over this place, dried up and left a vast bed of salt nearly 50 miles long. The supply is inexhaustible and the quality excellent.

**LONG-DISTANCE TELEGRAPHY.**—An extraordinary feat in telegraphy was accomplished recently when an interview took place by cable between London and Vancouver, through lines of wire equal to 7619 miles. A reply was received within six minutes from the Pacific side after the conversation began. The messages outran the sun by eight hours.

## MINING SUMMARY.

The following is mostly condensed from journals published in the interior, in proximity to the mines mentioned.

## CALIFORNIA.

## Amador.

**PLYMOUTH.**—Cor. Amador Ledger, Feb. 18: Regular pay-day has come in Plymouth, and helped to liven up the town a little, but it does not tell when the next pay-day will come at the mine, as there is no work going on, except hoisting out water at the south shaft of the Empire mine. It seems to be generally understood, however, that the mine is going to be opened, and a general examination of that part of the mine that is or was on fire will be made. If the fire is out, it will put an end to the eternal waiting of the miners, and make all hands lively. There is more prospecting going on at the present time than ever before; the main reason for it is on account of the mine being closed down. Many of the men working for the company have locations that are thought to be valuable, and some of them have had considerable work done on them before this, so the owners during the slack time are busy running tunnels, sinking shafts, and generally developing their claims. T. Bawden has a tunnel on his claim north of town about 400 feet long, and expects to tap the ledge at a good depth next week. He has put in a track and a good car. He has some good rock from a shaft sunk on the ledge. Messrs. Ninnis & Pulch are working on their claim on the Ochre lead; it has always been a paying claim and we may have a strike to report before long. There are many more parties at work.

**TO SINK DEEPER.**—Amador Ledger, Feb. 18: Messrs. Stafford, Eaton and another gentleman, from Oakland, were in Plymouth last week for the purpose of examining the Chicago or Cupps mine, in which they are largely interested. It is reported that they expressed themselves as well pleased with the outlook, and that it is the intention to sink the shaft 200 feet deeper without delay. The miners of the Middle Bar tunnel were paid off the end of last week, the sum of \$1200 being sent up from San Francisco for that purpose. This was sufficient to pay over one-half the indebtedness. The balance of the creditors are willing to wait for awhile. Mr. Belshaw, one of the owners of the Kennedy mine, came up Sunday, and has been looking after the mechanical work at the mine during the week. They are preparing to put up new machinery at the north shaft, with other improvements, which tend to show the faith of the owners in the mine. The taking out of water from the main shaft, preparatory to sinking, is progressing slowly. It will take some time to get to the bottom, as the 900 level was entirely submerged. A cleanup has just been made at the Spagnoli 5-stamp mill at Clinton. About 700 tons of rock was crushed, which yielded an average of 77 per ton. The lead is small, and the ore hard, so that this yield will not do more than pay expenses.

## Butte.

**THAT COAL MINE.**—Gridley Herald, Feb. 16: Thomas Kersey, of the Buttes, is interested in the vein of coal recently opened near Sutter City, and informed us that the vein is two feet wide and gradually getting wider as it is followed in. Several experienced coal miners have visited the mine and are confident that the vein leads to a vast deposit of an excellent quality of canal coal. The coal has been tried on several blacksmith forges and gave satisfactory results. A crew of men are at work following up the vein.

## Calaveras.

**ANGELS.**—Cor. Union-Democrat, Feb. 18: As is well known, Angels is having a boom; and we believe it has come to abide with us. For 30 years no such activity and enterprise has been experienced in this section. The advent of capital and the intelligent, scientific application thereof is doing wonderful things. At the Lane & Utica mine, the lode has increased materially in width and in value, and now at a depth of 300 feet, the property has a larger lease of value and life than was ever dreamt of heretofore. The mine and mill are constantly under vigorous and systematic operation. Ten Frue concentrators were recently placed in the mill and the concentrators are sent at once to the chlorination works, now owned by Hayward & Co. The chlorination works have a large capacity. The Becktel mine is also in full operation and is paying well. Economical administration and cheapness of reduction make this property a veritable fixture. The Tozer works are looming up on the horizon of mining industries as a mammoth institution, and many more mining enterprises are now coming into tangible shape, which previous to the above vast undertakings were not regarded as feasible.

**COPPER.**—Angels Echo, Feb. 18: The work of extracting ore from the Union Copper mine at Copperopolis goes ahead as briskly as present facilities will permit. We are informed that there are about 40 men employed in this mine at present, with a fair prospect of an increased force shortly.

## El Dorado.

**PLACER MINE.**—Placerville Observer, Feb. 21: The Chili ravine placer mine, under the active management of Supt. Coughlin, have their tunnel in 1300 feet. They have their full mill of fine-looking gravel, and are now crosscutting to find a flat on the north side of the channel. If this should be found as Mr. Coughlin expects, the mine will be good for years to come. It was on Chili ravine below this mine that W. T. Coleman, the commercial king of San Francisco, made his first raise in California in 1849, and which proved to be the foundation of his now enormous wealth.

## Nevada.

**SLUICES ROBBED.**—North San Juan Times, Feb. 17: Wednesday night of last week several sluices belonging to Sam Crall and John Trood, situated in the American mine, were cleaned up by outsiders, supposed to be Chinamen. On that day the owners did not work, and that night the sluices were robbed. There was a month's hard run in the sluices, but exactly how much gold was taken from them cannot be known. One box, the one at the extreme lower end, was not touched by the sluice-robbers. It was subsequently cleaned up by Crall & Trood, and paid \$250.

**GRAVEL MINING NOTES.**—Grass Valley Union, Feb. 18: The machinery being erected on the Pet

gravel mine, at Randolph Flat, will be in running order about next Tuesday. Stronger machinery is being put up than was at first contemplated, and it will be sufficient to do the hoisting and pumping, however strong may be the flow of water, and to aid in whatever prospecting of the ground that may be undertaken. Cunningham & Co. continue to take out good pay gravel, but it is intended to put up a small mill for crushing, as it is found that the washing of the cemented gravel in sluices does not save all the gold, a considerable percentage being contained in the cement that does not dissolve by being washed by the sluice process. Pellet & Co., on Deer creek, have started up their mill for the crushing of gravel, and the prospects are quite encouraging, the gravel prospecting well.

**SINGULAR FORMATION.**—Transcript, Feb. 18: Between Washington and Phelps Hill, in this county, is a stratum of slate and plumbago about 300 feet wide, and it has been traced 2000 feet in length. The composite is almost as soft as pipe clay. At either end its course appears to be cut off by enormous ledges of barren quartz. Various amalgamating assays have been made from this soft mass of slate and plumbago, in all of which traces of gold can be found. The plumbago is from 10 to 15 per cent of the whole mass. Professor Silliman calls the formation "a highly plumbaginous slate." Many years ago the whole country thereabout was located, and it was thought a rich deposit of gold would be found there; but nothing came of it, notwithstanding a great deal of work was done on some of the claims.

**NORTH BLOOMFIELD.**—Nevada Transcript, Feb. 16: "From having till within a very short time been regarded as the liveliest town in the county, it has grown to be one of the dullest," said a citizen of North Bloomfield in speaking of that place. "How many men are working for wages in the mines there?" asked the reporter. "I cannot give you the precise number. The Malakoff has 13 men employed, and it is conscientiously trying its best to make the elevator process of mining a success. The apparatus used is liable to get out of order and cause delays. Again, but a limited amount of dirt can be handled, and a large quantity of water is required to work out a small piece of ground as compared with the hydraulic process. It has been pretty thoroughly demonstrated that only extra good dirt will pay. There are 'streaks of lean and streaks of fat' in good auriferous gravel channels, the same as in good bacon, and the channel that does not average pretty well up in the 'fat streaks' cannot be worked profitably by the elevator plan. The Mabel drift mine is worked out, the deposit of pay-gravel within its boundaries having been exhausted. Of course you know about the Derbec. The owners say they cannot make it pay with wages at \$3 a day. It is the general belief among us that the Derbec will not be worked again till the rate is down to \$2.50 a day. We fear that the latter will become the standard wages not only in North Bloomfield, but throughout the county, before many months elapse. The mine-owners at Nevada City and North Bloomfield are certainly making a fight to that end, and we are told that if it were not for the Idaho company Grass Valley district would be in the same boat." "The Last Chance drift claim at North Bloomfield is working, is it not?" asked the reporter. "Yes, to the extent that a prospecting tunnel is being driven, with a splendid outlook for making a rich development eventually. The Last Chance is a local company, and its capital is limited. But the stockholders have nerve and staying qualities. They will doubtless receive their reward in due time, but just at present their operations are not extensive enough to afford employment to many men."

**VERY SATISFACTORY.**—Grass Valley Tidings, Feb. 20: From 100 tons of ore the North Banner Mining Co. have cleaned up 84 ounces of gold. This does not include sulphurets, of which there are five tons, estimated to return \$200 per ton. From the 100 tons of quartz a small quantity of the best was picked out for smelting. Stockholders are highly pleased at the outlook, and there being "lots of it in sight," are indulging in pleasing anticipations of dividends.

**MUSCLE AND GRIT.**—Work Your Own Diggings mine is a paying property. Brockington Bros., Feeney Bros. and others are the owners and practical workers. In a little more than a year they have opened up the lead to a depth of 200 feet, built a five-stamp mill and constructed hoisting and pumping works. All this has been done by hard work. Saturday \$500 was cleaned up as the yield of 20 tons of ore, and the mill is still overcrowded with quartz of the same quality. An endeavor to secure another mill to crush the surplus is being made. The ledge averages 14 inches in thickness and gives every indication of permanency.

## Fresno.

**GOLD.**—Fresno Republican, Feb. 17: We were shown yesterday 12 or 15 chunks of bullion from the Rough and Ready mine, in the Fresno district, owned by Messrs. Knobloch & Young. The pieces of bullion will weigh about \$10 each, and a sight of them is sufficient to cure sore eyes. The Rough and Ready mine is now one of the most promising in the district, and will be developed on a large scale in the spring. All the mines of this section are improving, both in output and prospect. Some people have an idea that the wealth of this county consists entirely of the products of its rich soil, but the richness and extent of the mineral wealth of the county is just beginning to be known.

## Inyo.

**SALE.**—Inyo Register, Feb. 16: Mr. Wm. Charles completed the purchase of the Dark Horse mines on Monday last. He has taken possession of them on behalf of the Mines Co., Limited, of London. No defined plan of operation is presented yet, but the mines will no doubt be vigorously worked. The Dark Horse sale is one of the most important mining events in the history of the county. Its local influence will doubtless amount in the aggregate to a good deal. These English companies are more in the habit of getting money out of the mines than out of the stock.

## Placer.

**WIDENING.**—Placer Herald, Feb. 18: General Hamilton is busy erecting a mill on the Dardanelles mine. The channel is widening. The Gray Eagle shaft is down over 200 feet in blue gravel and washed boulders, with good indications.

**FOREST HILL.**—Placer Republican, Feb. 18: The Dardanelles, one of the richest mines on the divide, but which has not been worked much for some time,

is again coming to the front with prospects. Jo Hamilton is here making preparations to put up a stamp-mill, to be run by water-power. Mr. Johnson, formerly Deputy Sheriff of this county, is to be foreman, and Henry Maye is to be underground boss. The General has bought the little ditch leading to Todd's valley, to carry water to the mill. A mill and several buildings will be erected at the mine this spring and summer. At the May Flower, Miller and Colwell are getting out timbers for the new mill. Extensive building will be carried on at the mine as soon as the weather settles, until snow flies.

**CLEANUP.**—A cleanup was made at the Morning Star mine near Iowa Hill, last Saturday, of 74 ounces after a run of 60 hours. They are crushing about 15 tons of gravel a day.

## Sierra.

**GOLD.**—Mountain Messenger, Feb. 18: The Bull Run claim near town is finding some gold. The company has been at work only a few days.

## Shasta.

**MIDDLE CREEK.**—Cor. Courier, Feb. 18: Peter Schearer, of the Tellurium mine, is visiting S. F., and when he returns he will resume work on the Tellurium. W. E. Frickey, of the Castle Peak mine, is running a tunnel, and is now in 68 feet, and taking some good ore therefrom.

## Siskiyou.

**HYDRAULIC MINE.**—Yreka Union, Feb. 16: Hon. R. H. Campbell's hydraulic mine in Quartz valley is now lighted by electric lights, the plant having been set up and adjusted last week by E. J. Kendall, electrician and superintendent of the Western Union telegraph office in this city. This is one of the largest and richest mines in the county, and the owner has practically demonstrated that what is worth doing is worth doing well. When Mr. Campbell bonded this mine, it was predicted that only loss and disappointment awaited him, but he opened up the mine properly and made a success of the venture, the annual yield for the past 3 years varying from \$40,000 to \$60,000. Mr. Campbell is a man of nerve and rare good judgment, and his enterprise has done much toward bringing Siskiyou before the public as a mining field.

## Tuolumne.

**GOOD MINE.**—Tuolumne Independent, Feb. 18: The indications point favorably to the development of a good mine at the Ham & Birney location. We have heard that rock richer than any before taken out has been struck. This is gratifying to the owners and to the community at large, who are benefited by permanent and paying mines. The experimental mill hammers away, day and night, and the indications for a good cleanup are very favorable. Messrs. Hastings, McKenna & Engstrom took out a \$2000 pocket near Yankee Hill last week.

## NEVADA.

## Washoe District.

**OCCIDENTAL.**—Virginia Enterprise, Feb. 18: On the 200 level, in the north incline winze, 25 feet above this level, the south drift has been extended 4 feet; total, 30 feet. A north drift was advanced 4 feet. In the lower tunnel, 150 feet south of the incline winze, the south drift has been extended 6 feet; total, 18 feet. Extracted 16 tons of ore.

**WEST CON. VA. & CAL.**—Sinking the main shaft and making good progress.

**OPHIR.**—The ore found in the upraise above the 1435 level continues to look well.

**BULLION.**—Good headway is making in the work of cutting out a working station at the 500 level.

**MEXICAN.**—No. 2 crosscut on the 1300 level still continues in soft vein porphyry. In this clay, slips are of frequent occurrence.

**SIERRA NEVADA.**—Good headway is being made in the south drift on the 520 level. It is in vein material of a favorable character.

**SEGREGATED BELCHER.**—On the 1300 level the drift south from the upraise is out 135 feet. The material is vein porphyry of a fertile appearance.

**GOULD AND CURRY.**—On the 200 and 300 levels are still prospecting for ore. Have mined about 170 tons in the past week of fair-grade milling ore, which is stored in drifts, as the dump is full.

**UTAH.**—On the 472 level, in west crosscut No. 2, 400 feet north of the main west drift, the incline upraise has been carried up 45 feet. The formation is vein porphyry and quartz, showing some water.

**BENTON.**—The drifts on the 725 level are being pushed ahead as usual. The formation promises well, the ground showing indications of fertility. There has been no change worthy of note since last week.

**ALTA.**—On the 725, 825 and 1150 levels are running lateral prospecting drifts outside of the vein. The upraise on the 725 level from the Keystone vein is showing streaks and bunches of ore. The mill has not yet been started.

**YELLOW JACKET.**—The daily shipments to the river mills amount to 350 tons. The ore development near the Confidence line continues to show improvement. Since putting in a blower the air on the 1100 level has been good.

**CHOLLAR.**—Are extracting ore at several points between the 550 level and the surface. In the north drift, on the 550 level, from the Sharon shaft have developed a body of fine ore. This ore is being extracted for milling. A good deal of prospecting is being done at several points.

**CROWN POINT.**—Good headway is making in the crosscut started on the Belcher line, and also in that opposite the west crosscut. Both of these crosscuts are on the 400 level. The south drift on the 400 level is being pushed ahead as usual. It is still in vein porphyry.

**CON. CAL. & VIRGINIA.**—High-grade ore is still being stopped at the bottom of the winze below the 1435 level. The ore found in the south drift on the 1600 level is showing up well. The usual amount of ore was shipped to the river mills, and the pulp assays averaged about the same as last week.

**SAVAGE.**—On the 400 level the north drift has been advanced 45 feet and the south drift 31 feet; both are in fair-grade ore. On the 600 level the south drift has been extended 28 feet and continues in ore of excellent quality. Are extracting and shipping to the Mexican mill about 140 tons of ore per day from the several levels between the 400 and 900

stations. The improvement mentioned in last report on the 900 level continues, and both quantity and quality are improving.

**BEST AND BELCHER.**—On the 425 level the main north drift has been extended 56 feet; total length, 501. The formation is quartz and porphyry. Upraise No. 1, started at a point 130 feet north of the south line, has been carried up 15 feet; total height, 50 feet. This upraise is passing through quartz showing value by assay.

**BELCHER.**—On the 400 level the crosscut is in a distance of 50 feet, the face showing material of a favorable character. The south drift on the 500 level is out 160 feet. The material is principally quartz, clay and porphyry. There is some water coming in. Good headway is making in the drift to connect with the Suto tunnel. The ground blasts well.

**ALPHA, IMPERIAL AND EXCHEQUER.**—Work is in progress in these mines on the 122, 222 and 382 levels. No. 3 crosscut on the 122 level is out 22 feet, and the face is in low-grade quartz. On the 222 level the north lateral drift is out 485 feet from the Alpha shaft. The east side is showing quartz of a favorable appearance. On the 382 level the south drift is out 70 feet. The face is in ore, the car samples of which are from \$35 to \$50 a ton. The north lateral drift is out 50 feet and shows good quartz in the face. The east crosscut on the same level is out 57 feet. The face is in a mixture of quartz and porphyry.

**HALE AND NORCROSS.**—On the 400 level the north and south drifts have been advanced 20 feet. The south drift continues in low-grade quartz and the north drift shows stringers of good ore. On the 700 level the ore development shows further improvement. The drift north from the top of the upraise is advanced 55 feet and continues in excellent ore. Have extended this upraise two square sets higher since last report in high-grade ore. Its total length is 108 feet. The south upraise is now 77 feet above the track floor and continues in ore of good grade. Have hoisted and shipped the usual quantity of ore to the mill, and have bullion on hand amounting to \$32,000.

## Aurora District.

**TUNNEL.**—Esmeralda News, Feb. 18: The English company at Aurora are driving a tunnel to tap the Live Yankee. The tunnel is in about 300 feet. The company expect to, strike the Yankee's nose in a few days.

## Central District.

**BOOMING.**—Silver State, Feb. 17: S. W. Ruse, who is up from Central district, reports that mining operations are booming in that camp. Frank Clark started his mill Monday on ore from the Locomotive. Charley Wright and Nicky Gill are at work on the Golden Age and taking out very rich ore. The Millionaire is being worked by the Ruse Co., and they are preparing to ship their rich ore to Salt Lake City. They have a large quantity of ore that assays from \$40 to \$60 per ton, which they hope to get worked at Clark's mill.

## Eureka District.

**BULLION SHIPMENTS.**—Sentinel, Feb. 18: During the past week Wells, Fargo & Co. shipped eight bars of Eureka Co. bullion, valued at \$19,889. Also five bars of passing bullion, valued at \$9000.

## Hawthorne District.

**IMPORTANT STRIKE.**—Esmeralda News, Feb. 18: Within the last week another important strike has been made in Hawthorne district. In running a crosscut northwesterly from the 150-foot level of the Lapanta mine a four-foot vein was struck. The lessees are jubilant over the discovery, for the ore is worth \$100 per ton.

## Palmetto District.

**MILL.**—Walker Lake Bulletin, Feb. 15: R. B. Catherwood, one of the largest stockholders in the New York and Palmetto Company, came out on the C. & C. last Friday. He has a high opinion of the merits of the company's property, and will push the building of the mill to as speedy a completion as possible. This mill will be small and is being erected for the purpose of proving the value of the mines by an actual working test. This proof, which, however, is a presumption now, will result in the construction of a large mill which will be of a capacity sufficient to reduce all the ores of the district. Owing to the many tests carefully made by the company the small mill now going up is really but making assurance doubly sure, and there is no reasonable question that Palmetto will soon be one of the most active and also one of the largest bullion-producing camps in the State.

## Tuscarora District.

**PONDERE.**—Times-Review, Feb. 18: Since last report good progress has been made in east crosscut. The change in the rock would indicate a near approach to the ledge.

**BELLE ISLE.**—Working in the old stops on 250-foot level, and accumulating some good ore.

**NAVAJO QUEEN.**—As soon as the sump has attained the proper depth, will commence to crosscut for the ledge, which is known further north as the North Belle Isle west vein.

**NEVADA QUEEN.**—West crosscut has been advanced 10 feet, without change in the texture of the rock. Have finished cutting out for winze and timbered the station. The ore shows an average of about 7 feet wide, 3 feet being a better quality than any ever extracted from the mine heretofore. Just started to sink the winze.

**FOUND TREASURE.**—The dirt which had run into the crosscut connecting the old shaft with the gangway 150-foot level, has been cleaned out sufficiently for ventilation and escape purposes. Have opened the ledge, which is from 3 to 4 feet thick on this level. A drift has been started on the vein in a southeasterly direction from the crosscut, and a stop has been started northwest of the crosscut. Some high-grade ore is being hoisted to the surface.

**NAVAJO.**—South drift from west crosscut No. 2, 250-foot level, advanced 10 feet; total, 106 feet. The vein shows some high-grade ore in places.

**NORTH BELLE ISLE.**—North lateral gangway, 400-foot level, has been extended 28 feet. The formation looks favorable, and the course of the gangway has been turned more toward the vein. There is no material change to report in the workings on the 300-foot level, except that No. 3 upraise has been connected with intermediate drift, improving the ventilation and giving a better outlet for the ore,

The stopes at all points are looking well and yielding the usual amount of the different grades of ore. On the 70-foot level the crosscut west to connect with the main shaft has been extended 11 feet. Good assays are obtained from the porphyry, and it looks as if we were approaching another vein. An upraise has been started on this level near No. 1 winze. The mill has been running steadily on high-grade ore.

**GRAND PRIZE.**—The work of cleaning out and retimbering the west drift from the 200-foot level station has been started, and as soon as finished it will be driven ahead to intersect the ore body extending upward from the 300-foot level. The stopes continue to furnish the usual quantity and quality of milling ore. Everything at mine and mill running nicely. Average battery assay for the week, \$197.

**COMMONWEALTH.**—Have discontinued work in the north drift, 100-foot level, as the ore has pitched out of the drift. It continues to look as well as at any time. East drift, same level, has been extended 32 feet, exposing very fine ore along the bottom. The total distance of 48 feet looks as favorable as at any point. A west drift has been started in ore, and run 8 feet, the ore being about 3½ feet wide. Average car sample returns \$249 per ton, the first class being taken out before sampling, and stored in the mine.

## ARIZONA.

**MARTINEZ DISTRICT.**—*Arizona Journal-Miner*, Feb. 15: Through the courtesy of F. M. Murphy, the editor of this paper had an opportunity of visiting the Martinez district during the past week and taking a look at the big ledge of the now famous Congress mine. There are 15 men employed at present developing the Congress mine under the foremanship of E. D. Gillespie. The main shaft is now down to a depth of nearly 150 feet, and shows up a big, strong vein of very high-grade sulphate gold ore. Other openings are also being worked, all of which show up rich in ore with a vein varying from three to six or seven feet in width. The property is one which has not only paid expenses, but has yielded good dividends from the grass roots down, and enough high-grade ore is now being shipped to pay all expenses of development, in addition to the tons upon tons of ore running all the way from \$50 to over \$100, which is being piled up on the dumps. And this, just from sinking, running drifts, etc., there being no stopping done yet. E. D. Gillespie and James O'Hara own a claim called the Ballick, adjoining the Queen of the Hills on the east, on which they have a shaft about 35 feet deep with good showing. O'Hara and Byrne have also a claim adjoining the Cumberland or Why Not on the west called the Bellevue. John Kelly also owns a good claim called the Excelsior. All the properties in the district make a good showing wherever worked, and this camp promises to be the best in the county at an early day. While there, it was also learned from Stanton that Mr. Kerr, who went down with J. M. Vandenburg, had, after a thorough examination of the mines in that section, satisfied himself of the feasibility of erecting a mill, and would at once commence work on one. This decision had already given an impetus to mining in Weaver district, and arrangements were being made by miners to work claims which would otherwise be allowed to remain idle. Several placer claims are being worked in Skull valley and are yielding good returns. The dirt is hauled to water a distance of from two to four or five miles, and from \$6 to \$9 per load is realized.

**CLARENCE-RUBY.**—*Prescott Courier*, Feb. 16: David G. Sinclair, who has just arrived from the Clarence-Ruby gold mine and mill, on Squaw creek, east of the Agua Fria, tells us that the first mill-run was highly satisfactory to the superintendent, Mr. N. Ellis, and everybody else. Mr. Ellis took the bullion to Phoenix and a wagon-load of rich concentrations has come to Prescott for shipment. Contracts for taking out ore and furnishing timber have been let and the enterprise is, surely, David says, a success. Near it are other mines carrying gold, silver and copper, which will shortly be tested.

**THE BOGGS MINE.**—Ore is constantly coming, by wagon, to the sampler, from this great Big Bug district mine, and several Prescott gentlemen are preparing to go out and look at it. Owners of extension claims are pushing work on them and have good prospects. The ledge was recently found on the north side of the creek, in McWilliams' corral.

**HILLSIDE MINE.**—John Lawler says that this fine mine is better than ever. Ledge larger than it was near the surface. There are about nine miles of road near Camp Wood over which wagons cannot be pulled, so no ore will be shipped until the snow melts and mud dries. Mr. Lawler tells us that chances are favorable for the sale of the big copper mines of Santa Maria district. There are about 100 miners in the district and there will be a thousand there inside of a year.

**TOMESTONE.**—*Epitaph*, Feb. 18: The new concentrators of the Old Guard are nearly completed. They are the old-fashioned buddies, and are two in number. Connection was made this week on the third level of the Old Guard with the combination shaft sunk between that property and the Lucky Cuss. The air in the mine is now as pure as need be. Sinking has been resumed in the main shaft of the Lucky Cuss from a depth of 270 feet. A new level will be run at 370 and the mine systematically opened. Considerable ore has been raised in sinking and drifting, but no stopping has been done. The Lucky Cuss and East Side promise to be the coming bonanzas of the camp.

## COLORADO.

**LEADVILLE NOTES.**—*Herald-Democrat*, Feb. 16: The Flagstaff is producing some very rich ore. The Olive Branch is becoming a large producer. The Mikado is still sinking the Chadbourne shaft to greater depth. Indications in the bottom of the shaft are very favorable for striking a body of sulphide ore. The ore recently discovered in the Gilt Edge was found in the lime. It is said that a body of ore five feet thick was cut, but it was of comparatively low grade and zinky. The Big Chief is hoisting some ore from the second contact. The prospects for the Big Chief striking the continuation of the same body of ore recently opened in the Castle View are excellent. The Evening Star is not at present producing any iron ore, owing to the small demand for it. The lessees of the mine are now working

in some of the bodies of the low-grade ore, standing in the east end of the property. This ore is of very low grade in silver, but carries enough lead to be mined and sold at a profit, with the present rates for smelting. Most of the smelters are heavily stocked with argentiferous iron ore, and with the uncertain condition of the Leadville smelting industry, it is now next to impossible to sell any iron, even of the most desirable quality. A bid of 45 cents per ounce of silver was made yesterday for a contract for some of the best iron produced in Leadville, and was refused. The new Antioch stamp-mill, in White's gulch, commenced running on Monday last, and so far appears to be doing excellent work. The mill is crushing about 100 tons of ore per day. The Tiger mine, at the head of Frying Pan gulch, has not been doing so well of late as was done last year. The mine is producing only a very small amount of ore. The rich ore recently struck was found in the upper level and was in a streak but a few inches wide. It assayed, however, as high as 1000 ounces silver. The new Sharpneck diamond drill in use at the Mansfield group is proving a veritable wonder. Tuesday night it put in 10 four-foot holes while four of the miners were drilling about 30 inches apiece; or about 15 feet to one, including all delays in removing cores, etc., when compared with the old hammer and drill process. Foreman Joseph MacDonald is very enthusiastic in its praise, saying: "The drill works fine; it couldn't work better. It's immense; I wouldn't trade it for anything."

## DAKOTA.

**ALEXANDER.**—*Deadwood Pioneer*, Feb. 18: Of the many prominent properties situated in Bear Butte mining district, few present better prospects than the Alexander. On the dump of the mine there are at present something over 100 tons of ore that assays all the way from \$10 to \$200 per ton. Developments are as yet limited, confined principally to a tunnel driven into the hillsides, something over 200 feet, and wherein operations are now being pursued. A pipe varying in dimensions from ten inches to four feet and from which ore considerably higher in grade is constantly taken, furnishes strong encouragement to work vigorously. The ore will not be shipped, as the management believes it will prove of more value to the mine if kept on the dump. The ground belongs to a company, incorporated, but none of the stock has ever been offered for sale, and none is now in the market.

**FLOAT.**—The Albe shaft has now reached a depth of 75 feet, and continues in as good ore as was found when 10 feet from the surface. Drifting will commence at the 100 level, and the company then resume ore shipments to the Iron Hill smelter.

**TIN TALK.**—*Journal*, Feb. 16: A gentleman who came in from the East yesterday said that he had been shown a bill of lading for a lot of tin mining machinery, shipped to Rapid City, also some papers alleged to be contracts for construction work on the narrow-gauge road to Hill City. The report was verified last evening, when it was learned the gentleman who brought the news is Mr. J. S. Robertson, administrator of the estate of which the C. O. D. store of this city is a part. The tin machinery spoken of has been shipped from Liverpool, consigned to Rapid City. Mr. Robertson was shown the bills of lading by Ed Johnson of St. Paul, agent of the Merchants' Dispatch line. The papers alluded to as regarding a narrow-gauge road were said to be sealed bids for grading and construction.

## IDAHO.

**WOOD RIVER OUTLOOK.**—*Times*, Feb. 15: H. E. Miller, who was in town last Monday, said that he was glad that the rate of wages was fixed. For months he was importuned, both by those who wished wages reduced and those who wished them kept up, until he finally agreed to a reduction. Since then, however, he has as good as received assurances of an important reduction in the rates of freight on ore and coal, and the outlook seems favorable for the tariff on lead to remain undisturbed. Now that the outlook has improved, the mine-owners can resume work with a certain degree of confidence. The Minnie Moore is steadily increasing its force, and in a little while it will doubtless have 140 men at work on its mine and mill. The Queen of the Hills management is putting on men as fast as they can be set to work to advantage, and the Relief will employ from 12 to 15 men for the present, with the probabilities in favor of an increase at no distant period. In addition to the above, several properties in the vicinity will afford employment to a few men each—so that it is quite likely that, within 60 days, between 200 and 300 men will be employed in the mines close to Broadford and Bellevue. From other districts the news is equally favorable. The immediate vicinity of Hailey will make a good showing this year, as the Schoolboy, Climax and Commodore have a large quantity of ore in sight, and the Japan is expected to resume its place among the ore-producers. Bullion will probably be livelier than ever. The Bullion Ophir group, Mayflower, Red Elephant group, Jay Gould, Rising Sun and Idahoan will all be worked and will yield handsomely. Deer creek will doubtless step to the front rank this year. The Montana, Red Cloud, Emery or War Dance, Champion or Walla Walla, and other properties, show bonanzas of greater or lesser extent, and several prospects promise to develop into mines. On the East Fork of Wood River the North Star will doubtless soon give employment to 100 men; the Triumph group to 15 or 20, and the Pride of Idaho and other producers to 80 or 90 more. Parker gulch will probably afford employment for 100 men next summer, as the Western Reserve and Parker groups already have ore, the former yielding an average of a carload of \$400 ore weekly already. Boulder creek promises to give employment to at least 50 men this season. At Vienna, the Vienna Co. will soon begin to run a deep tunnel at least 1500 feet long. This will give new life to that entire region. The good results attained by the Tahoma Co. at Atlanta will doubtless cause a resumption of active operations in many of the old producers of that important camp. Rocky Bar and Pine Grove districts will probably give employment to all of 500 miners. Over 200 are at work there already. Smoky will do better than ever this year. The Silver Star will doubtless ship a carload per day, and Carrie Leonard half as much, while the King of the West group and the remainder of the district will doubtless equal the combined production of the Sil-

ver Star and Carrie Leonard. The Gold B-T promises much this summer; the Champlain Co. will build a mill; the Jumbo Co. have cut their ledge in depth; the Junction group is showing an extensive ore body, and the Canas No. 2 will doubtless go to strong hands. This will give value to the whole belt, Muldoon and vicinity, Era and neighborhood, and the Lost River region all promise great results this year. The general outlook for Alturas county is therefore better than ever before.

**BLISS PLACER.**—*Boise Statesman*, Feb. 17: J. S. Hunt, the placer miner from Bliss, was in town this week and reports that during the past 5 years they had not lost a day on account of cold weather. The stream from which they get their water never freezes, raises or falls, and is never muddy. The mines have been paying all the time and are as good to-day as they ever were. The product therefrom is very regular, and averages about \$10,000 a year.

**BANNER.**—*World*, Feb. 17: The Banner mill, owned and operated by the Elmira Silver Mining Co., is closed down for the present. The business of this company is carried on in such a quiet way that but little is known of their operations by any one outside the camp, except the fact that silver bars are shipped over the road during the time the mill is running. We are now informed by one who knows that the product of 1750 tons of ore milled there this season was 125 bars, weighing something over four tons of solid silver, averaging 940 fine, making the output from the mill about \$1000 per day for all the time the mill run, and their milling capacity is limited at that, being only 20 stamps and not sufficient furnace capacity to roast as much pulp as the stamps will furnish. They have paid a dividend of 20 per cent on their capital stock. This is the second dividend paid by this company, all of which has been taken out of the ground, besides the cost of improvements made on the property since this company bought it, amounting to probably \$100,000 or more, besides labor, supplies and general running expenses, showing conclusively that there's money in Boise county mines when properly worked. The superintendent, Mr. Brown, has gone East to buy a complete new outfit for sinking on the Crown Point and Wolverine ledges, both being on the same vein. The company are working 30 men this winter in the Banner and Wolverine ledges, some stoping and some prospecting, under the direction of Gerard Huppertz, foreman of the Banner, and Ben Miller, foreman of the Wolverine. These two mines are one mile apart and on different leads.

## MONTANA.

**GRANITE MOUNTAIN.**—*Butte Miner*, Feb. 16: The output of the Granite Mountain for the week ending Saturday, Feb. 14, was 36 bars, carrying 61,403.84 ounces fine silver and 22,284 ounces gold. Everything is moving smoothly and there is nothing new to report. The production of the Hecla company at Glendale for 1887 amounted to 457,712.29 ounces of silver, 401,531 ounces of gold, 132,886 pounds of copper, and 4,545,379 pounds lead.

**WILL SINK 2000 FEET.**—*Inter-Mountain*, Feb. 16: The Mountain View expects to receive its new hoisting machinery in about 10 days and within three or four weeks of its receipt will have it in position and ready to start up. The engine will be a Corliss automatic cut-off with 500-horse power capacity, one of the largest in the camp. It is the company's purpose to at once commence sinking on the completion of the new hoist and to stop for nothing until they reach a depth of 2000 feet. This will be not only the deepest shaft in the camp but also the deepest in the mountains outside of Virginia City, Nevada. The deepest workings now in Butte are only about 1150 feet—in the Lexington. It will mark an important departure in mining in Butte.

## NEW MEXICO.

**MOHAWK.**—*Rio Grande Republican*, Feb. 18: Ed Hampton and Canyon, who were working the Mohawk mine which adjoins the Modoc, found a good body of ore which assays 120 ounces in silver and 55 per cent lead. They were in town this week and took a bond on the mine for \$20,000 from the owners, J. H. Ryerson and John H. Riley.

**NEW DISCOVERY NEAR LAS CRUCES.**—Albert Fountain, Jr., and others located last week a number of claims on Elephant Hill, the little round mountain southeast of town about four miles distant. The discovery was made on the east side of the mountains, and is a contact vein between lime and porphyry showing carbonates and manganese.

**THE CRYSTAL CAVERN.**—Supt. Fitzgerald of the Bennett mine spent a week in prospecting the Crystal cavern in the Bennett mine, which he finds shows a fine body of mineral clear to the bottom. The cavern is several hundred feet long, and by shooting away the lime crystals which overlie the vein, the ore was exposed. At one place a block of ore as large as a box car stands out bodily. This means the doom of the beautiful cavern over which every visitor raves, for the ore is of greater value than the magnificent stalactites.

**THE STRIKE ON THE BENNETT.**—Another strike occurred on the Bennett mine this week. Several miners quit and the superintendent informed them that they would be paid on the 20th, which was set as payday, the miners being paid once a month. A meeting was held at Organ and a demand was made for pay every two weeks with the privilege of quitting whenever they pleased and being paid in full at the time. The superintendent refused to accede to their demand and the entire force struck. Friday they came into town and were paid off.

**THE BONITO CAMP.**—Mr. Moses Wiley, who has been sojourning in the beautiful Bonito country for the past few months, has told the *Republican* something concerning the mines of that locality. The great Parsons mine is supplying ore for two small mills, one an improved arastra and the other a Huntington centrifugal mill. Every stroke of development shows the great extent of the ore body and the owner has refused a bona fide offer of \$150,000. It is rumored that definite arrangement has been made for putting in a 100-stamp mill to work the ore this spring.

**COONEY.**—*Silver City Enterprise*, Feb. 18: Wm. Antrim of Cooney was here this week. He has a gold claim on Copper creek with a three-foot vein that so far as worked shows \$30 to the ton. A fine assay was obtained a few days ago from the rock

ground out by sinking a drill. The San Vicente Company has elected the following officers for the ensuing year: President, W. A. Wilcox; vice-president, M. P. Johnson; treasurer, F. Holtzclaw; secretary, R. L. Little. Major Frisch expects work on the Winner and possibly on the Bosworth, a west extension of the Bynner, as soon as the affairs of the company are straightened out at St. Louis.

**LAKE VALLEY.**—*Globe-Democrat*, Feb. 16: The Silver Mining Company of Lake valley is making arrangements to again open up the famous Bridal-Chamber shaft. Persons interested in mining matters will remember this mine as being the richest in the Territory. The ore consisted of almost solid silver. The mine was filled up some time ago, but later investigations have developed the fact that the deposit is not yet exhausted. Great things are yet expected from the Bridal Chamber.

**PIÑOS ALTOS.**—An *Enterprise* representative spent several days of this week in the booming camp of Pinos Altos. There are three mills running on ore and several companies working extensively, and also a number of individuals who are doing more or less work, according to their means and prospects. Altogether there are probably 150 men working in the camp, and others are being put to work as fast as developments will allow. Several houses have recently been built, and others are under way.

**COONEY CAMP.**—*Cor. Silver City Enterprise*, Feb. 10: Mr. Huston of Denver has purchased the interest of Eli Madden and M. Johnson in the Oakland mine, which is now regarded as one of the best properties ever discovered in the Magallons. The vein now shows 2½ feet of \$300 ore. M. Cooney's 5-stamp mill is nearing completion on the Silver Pink property on Silver creek. John A. Miller has started up the Peacock mine, and is piling up a large quantity of ore on the dumps. There is also a rumor in circulation that the Buick Head and Alpine mines will furnish ore to start the Sheridan mill, or in other words that the Sheridan mill will be run on custom ore, of which there is an abundance in this camp. Shelton & Penny alone have nearly 10,000 tons of ore in sight that will average \$40 to the ton.

## OREGON.

**GOOD NEWS FROM WALLOWA.**—*Bedrock Democrat*, Feb. 15: News has arrived in this city that the Wallowa Mining and Tunnel Co. has struck a rich blind ledge in the tunnel now being driven into the mountain to strike the main body of ore. The specimens received indicate that it is very rich and will assay high in silver. This is good news to the fortunate stockholders, as it indicates a larger body of ore than was anticipated, as also that the mountain contains numerous blind ledges. The men at work in the tunnel are still in the ledge, so that until they strike through it there is no knowing how large a body of ore has been struck.

## UTAH.

**ORE AND BULLION SHIPMENTS.**—*Park Record*, Feb. 18: During the week the Crescent shipped 168.275 pounds of first-class ore. For the week just ended the Mackintosh sampler received 200,980 pounds of Ontario ore; 18,970 of Daly, and 40,620 of Sampson ore; total, 260,510 pounds. On the 15th inst. (Wednesday) 8 bars of Daly bullion, 9592 fine ounces of silver, were shipped from the Marsac mill. The Ontario shipped no bullion the past week.

**PARK NOTES.**—*Salt Lake Tribune*, Feb. 20: Owing to the fine weather during the past week, which has cut up the roads considerably, the ore shipments have been comparatively light. The oldest inhabitant does not remember of having experienced such fine weather here during the month of February. At the Anchor tunnel the work is progressing rapidly, and it is expected that connection will be made with the intermediate shaft during the coming week. At the Crescent mine the sinking of the shaft was stopped for a few days, owing to water coming in. At the present writing the water being under control, the work is progressing as before. An extra force of men has been put to work at the Sampson, and if indications are any sign for the future, the mine will soon be a source of gratulation to its many patient and persevering stockholders.

## WASHINGTON.

**SWAUK PLACERS.**—*Cor. Ellensburg Capital*, Feb. 16: Commencing at the mouth of Becker creek, Bill Donahue and Phil Kummiskey are drifting in the old French claim on Selma Point. They are running on a bench south of the deep channel, where the Frenchmen lost their pay, and are now stoping in some very fine-looking red gravel, tight to the b-d-rock. The boys are doing good work, and expect a good cleanup in the spring. Tom Dixon is sinking in bedrock on Selma Point, to strike the seam that yielded so richly some years ago. John Back and Willie Peterson are working on the Swauk ditch, clearing out the snow and repairing breaks, while the weather permits, with the intention of taking advantage of every fine day to ground-sluice when the water is through. George Hampton, who blasted out a new ground-sluice race this winter, has already cleaned out the Williams creek ditch, which is now running full, and intends to commence piping as soon as the bank thaws out sufficient to make a stram effective. At the head of Williams creek, Bill Elliott is running a tunnel in a fine quality of blue quartz, and feels confident of striking a vein of ore. Tommy Meagher arrived a week ago with an assistant, and the trio, Tommy, Bigney and the new man, are putting in big licks laying flume. The giant and pipe are on the ground ready to be placed in position. Nelson and his nules, Gus Nelson & Bergstrom, are conspicuous at the mouth of Williams creek, where they are running a tunnel with the co-operating services of a mule and a scraper. The Chinamen are making elaborate preparations for next summer. They have turned the Swauk to the west bank, and have cleared the bed of the creek of brush and timber in a manner that looks as if they intend to clean up the whole business this season. Jake Livingston and his boys are getting everything ready in anticipation of getting started up by the 20th of this month. Mat Watson returned from Peshastan to-day, where he has been doing some assessment work. He brought out some rock with him which I learn is away up,

— THE —  
DOUBLE "ECONOMIC" STAMP MILL.

We have here the Stamp Mill in a cheap and simple form. The high drop of the old stamp is more than compensated for by the great weight (1200 lbs. each) of our stamps, and the rapidity (300 strokes each per minute) with which they run. There are 4 shoes in each stamp, so that there are 4800 strokes of the shoes on the dies per minute. Less power is required than in any other mill to do the same amount of work.

The Mortar has screens at both ends, giving ample discharge. There are no cams or tappets to wear or be adjusted. The stamps adjust themselves as the shoes wear.

AN AUTOMATIC ORE FEEDER

Goes with each Mill. We also have a suitable

**Rock Breaker.**

Several Mills are now in the mines doing excellent work. The "Economic" is not only a mill for small mines, but we believe it is destined to supersede the old stamp in mills of the largest capacity.

**TATUM & BOWEN,**

34 and 36 FREMONT STREET,

SAN FRANCISCO, CAL.

Manufacturers of Mining and Sawmill Machinery, Engines, Boilers, Etc.

— THE —  
JOSHUA HENDY MACHINE WORKS,  
Nos. 39 to 51 FREMONT STREET, SAN FRANCISCO, CAL.

"HENDY" IMPROVED "CHALLENGE" ORE FEEDER.

The best form of Feeder ever devised, and pronounced by reputable mining men to be far superior to any form of "Roller" Feeder manufactured. We refer to the following gentlemen who have furnished us with testimonial letters to the above effect, which can be seen at our office, viz.:

N. W. CROCKER, Supt. Bunker Hill Gold Mining Co., Amador City, Cal. D. C. WICKHAM, Taylor Mine, Greenwood, Cal.  
J. R. TREGLOAN, Supt. South Spring Hill Gold Mining Co., Amador City, Cal.  
W. G. ROBERTS, Greenwood, El Dorado Co., Cal.

WE ARE MANUFACTURERS OF THE

"CHALLENGE," "STANFORD," "TULLOCK," & "ROLLER" FEEDERS,  
And will furnish descriptive Catalogues and quote prices upon application.

FROM 2 TO 100 H. P., ALWAYS IN STOCK

MILL SUPPLIES AND LUBRICATING OILS.

**FRISBEE WET MILL.**

This Mill, with a weight of less than 9000 pounds, has a capacity equal to 30 stamps, reducing two and a half to three tons per hour of hard quartz to 40 mesh.

IT HAS NO MORE WEARING PARTS THAN CORNISH ROLLS,

And renewals will not cost over one-half as much as for stamps. The attention of parties having Cement Gravel is called to this Mill, as it will run 100 tons per day to No. 8 mesh.

OUR DRY MILLS are the most economical ever built, and are extensively used with record of several years. No grinding in pans. Mill finishes to any fineness desired.

**FRISBEE-LUCOP MILL COMPANY,**

GIDEON FRISBEE, Manager.

## JAMES LEFFEL'S Mining Turbine Water Wheel.

These Wheels are designed for all purposes where limited quantities of water and high heads are utilized, and are guaranteed to give more power with less water than any other wheel made. Being placed on horizontal shaft, the power is transmitted direct to shafting by belts, dispensing with gearing. Estimates furnished on application for wheels specially built and adapted in capacity to suit any particular case. Further information can be obtained of this form of construction, as well as the ordinary Vertical Turbines for Wooden Penstocks and in Iron Globe Cases, free of cost, by applying to the manufacturers.

NEW YORK OFFICE, 18 BROADWAY  
Room 709.

## The Copper Syndicate.

It is stated that all the copper now being bought in this country is being rapidly shipped to France. They evidently want to transfer the rule of the copper market from England to France, and have a very good show of doing so. This French syndicate is said to have about \$250,000,000 to back up their project. The famous Tharsis copper mine has agreed to sell to the copper ring all the copper it produces, at £65 per ton, and the ring undertake to refund to the company half of the profits of all they may sell at above that price. It is now stated, also, that this same syndicate has obtained the control of the output of the Calumet and Hecla copper mine, Lake Superior. The syndicate has also absorbed the Rio Tinto copper mine in Spain and the control of all the Chile bars, so that they have the copper of the world under their control. The prices paid by the syndicate are not ruling prices. The Butte mines in Montana get 11 cents for their yield for the next two years, it is understood, while the Lake Superior mines get 13 cents. The syndicate is not selling, but is shipping every ounce across the water.

The subject of this syndicate has come up in the Chamber of Deputies at Paris. It has been urged that the object is to oppose small manufacturers. The supporters of the ring contend that the result of the combination will be the transfer of the copper market from London to Paris, and claim that its formation has already increased the public fortune in France to the extent of 100,000,000 francs.

At all events, the rise in price of copper resulting from the operations of the syndicate has had the effect of starting up many mines on this coast. In this State the old Copperopolis mines are being opened. In Nevada several copper properties are being examined with a view to re-working them. In Arizona a number of mines which have been closed down have again started up. It is now stated that the United Verde copper mines, 30 miles from Prescott, have been sold to M. Clark of Butte, M. T. The property has been idle for some time owing to the excessive cost of transportation of coke and of shipping bullion. The recent rise in copper has assured its owners that both mine and mill can be run successfully. The price paid is not stated, but it is considered a handsome sum, as the former owners held it at \$3,500,000 before the rise in copper. The mining outlook for Arizona is most flattering, hardly a day passing but some sale of mining property is consummated.

A carload of machinery for a smelting furnace has arrived at Golconda, Nev., for Ronlestone & Bates, who own large copper mines about 12 miles south of that station. There is ore enough in sight to run the smelter for months.

## Mining Share Market.

Stocks continue low here and inactive as well, notwithstanding that the mining situation on the Comstock is working well. The daily shipments of Con. California and Virginia ore have been about 300 tons, and the battery assays average well. All the ore-producing sections of the mine are looking well. The usual amounts of ore have been extracted at the middle mines and at the mines in Gold Hill. In the north drift on the 550 level of the Chollar mine a rich deposit of ore has been found. This body of ore is already over 15 feet wide, and appears to be rapidly increasing in width. Portions of the deposit will assay well up in the hundreds, and all is good milling ore just as it comes from the vein. Some samples show well in native silver. The body of ore found is supposed to be the same that was found on the line on the 400 level of the Hale and Norcross. The 400 level of the Norcross corresponds to the 650 level of the Chollar.

## Bullion Shipments.

We quote shipments since our last, and shall be pleased to receive further reports:

Con. California and Virginia, Feb. 18, \$77.725; Pollock, 14, \$8000; Bluebird, 14, \$19,833; Germania, 16, \$1790; Hanauer, 16, \$2200; 17, \$4575; Germania, 17, \$3149; Hanauer, 18, \$2200; Crescent, 17, \$3725; Hanauer, 19, \$2200; Lexington, 17, \$31,824; Germania, 19, \$1642; Hanauer, 19, \$2175; Argus, 17, \$7331.

IRVING M. SCOTT, who secured for the Pacific Coast the contracts for building the iron cruisers Charleston and San Francisco, will contribute an article to the *Overland Monthly* for March, describing the difficulties encountered in raising the sunken British four-master Earl of Dalhousie from the bottom of San Francisco bay, in 1885.

## Watches as Machines.

Watches are carried for many different reasons. Some men, and most women, carry them principally for ornamental purposes, while others buy and carry them as they would buy and maintain any other machine or instrument, simply for the service they will render.

Watches are usually classed among jewelry, and a ladies' watch, with its elegant, fine gold case, studded with diamonds and other precious stones, is undoubtedly properly so classed, especially if the movement is so small (as many Swiss movements are) as to make it incapable of keeping accurate time.

But the watch of a locomotive engineer is carried by him solely because it is necessary for him to know the exact time, and not for any purpose of display.

To him it is simply a machine, or instrument, purchased and carried for a certain definite and utilitarian purpose, and to suit him every part of it should be like his engine, so constructed and so arranged as to best serve that purpose. If an engineer should find that those bearings about his engine which could be easily seen and examined were of decidedly better material and construction than those which could not be so easily seen, he would condemn the engine and lose all faith in its builder.

Locomotives are not built in that way, but we believe the majority of watches are. Instead of the total number of jewels in a watch movement being so disposed as to give the best results in point of service and wear, they are usually so arranged as to make the best appearance, and since they are usually invisible if placed in the lower plate, they are all put into the upper one.

Now, if watch movements are to be considered simply as jewelry, this is all right; but if they are to be considered as machines or instruments, constructed with a view to the performance of a certain function in the best possible manner, then it is all wrong.

If, as often happens, a wheel or pinion is nearest the lower plate, then, of course, much more wear comes upon the bearing in that plate than upon the corresponding one in the upper plate, in which case a jewel in the upper plate only is a real injury, because the wear being so much more rapid at one end than the other, the wheel rapidly gets out of square, and the inequality is in this case increased by the jewel, while it would be decreased by placing it in the lower plate.

If a maker of any other instrument of precision or any maker of machinery should turn out work constructed upon such a principle he would suffer in reputation, and would be regarded as dishonest. By what principle of ethics are the makers of watches exempt?

If jewels are set into watch cases, they are, of course, put there for ornamental purposes only, and should be so arranged as to make the best possible appearance. But if they are put into the movement, they should be so arranged as to secure the best results in wearing qualities, which is the only legitimate object in putting them there at all.—*American Machinist*.

**STANDARD CONSOLIDATED.**—At the annual meeting of the Standard Consolidated Mining Company of Bodie, held on the 20th, the following were elected directors: Joseph Tate, New York; W. H. Osoyany, New York; A. Pettibone, Bodie, Cal.; T. C. Grant, San Francisco; A. P. Brayton, San Francisco; P. N. Lillenthal, San Francisco; John Mason, San Francisco. At a meeting of the board held subsequently the following officers were elected: A. Pettibone, president; Joseph Tate, vice-president; J. W. Pew, secretary; Anglo Californian bank (Limited), treasurer; the Farmers' Loan and Trust Company of New York, transfer agents. Total receipts for the fiscal year, \$304,792.54; total disbursements, \$257,248.04. Cash on hand and in New York, \$78,341.98. Dividends were resumed during the year and \$40,000 paid. Dividend No. 72 of 10 cents, payable March 12, 1888, was declared at a meeting of the board.

## Complimentary Samples.

Persons receiving this paper marked are requested to examine its contents, terms of subscription, and give it their own patronage, and, as far as practicable, aid in circulating the journal, and making its value more widely known to others, and extending its influence in the cause it faithfully serves. Subscription rate, \$3 a year. Extra copies mailed for 10 cents, if ordered soon enough. If already a subscriber, please show the paper to others.

**SILVER EXCITEMENT.**—A special from Adelaide, South Australia, of Jan. 28th, has the following: In the city a perfect silver mania has set in, and the excitement is unprecedented. A number of shopmen in town have thrown up their engagements and repaired to the field, where they have gone in for speculation. One of their number is reported to have made \$20,000 in three months, but most of them have lost everything. One mining broker cleared £19,000 last week, but should a sudden fall in stocks take place it means ruin to a large number.

**THE SWISS-WATCH INDUSTRY.**—It is stated that the importation into Europe of the Waterbury watches has done great damage to the trade in cheap Swiss watches.

## New York Metal Market.

Telegraphic advices dated Feb. 23d give the following New York prices:

BAR SILVER—96 1/2c per oz.

BORAX—94 1/2c.

COPPER-LAKE—\$16 75 @ —.

IRON—No. 1, \$22.00.

LEAD—\$5.00 @ 5.25.

TIN—\$36.50.

The following is the latest by mail from the "New York Metal Exchange Market Report":

COPPER—Quotations spot closing at \$16.90 @ 17.00. Transferable Notices (Lake) issued at \$16.80 @ —.

LEAD—Buo at \$4.92 1/2 @ 5.00 spot. Transferable Notices issued at \$5.00.

TIN—Quiet at \$36.85 @ 37.00. Transferable notices issued at \$36.00 @ 36.16.

MARSH'S PRICES—At tidewater. 100-ton lots of listed irons (when brand is specified) range nominally about as follows: Lehigh, Grade No. 1, \$20.50 @ 21.00; No. 2, \$19.50 @ 20.00; Grey Forge, \$17.00 @ 17.50; Hudson River, Grade No. 1, \$20.00 @ 21.00; No. 2, \$19.00 @ 20.00; Grey Forge, \$17.50 @ 19.00; Southern, Grade No. 1, \$20.00 @ 21.00; No. 2, \$18.50 @ —; Grey Forge, \$17.00 @ —.

Prices generally ruling for metals not regularly dealt in on call at the N. Y. Exchange, covering extremes of buyers' and sellers' views. All prompt delivery. Australian Tin, \$37.50 @ —.

BEST TIN, \$38.00 @ —. Baltimore Copper, \$14.75 @ 15.25; Orford Copper, \$15.50 @ 16.00; P. S. C. Copper, — @ —; Foreign Lead, \$6.40 @ 6.60; Foreign Spelter, \$6.10 @ 6.30. Antimony, \$11.50 @ 12.00.

**BOWERS' DREDGER PATENTS.**—Scrivner & Boone, attorneys for A. B. Bowers, have brought suit in the United States Circuit Court against Williams & Bixler, H. H. Lynch, the Golden State and Miners' Iron Works and Geo. E. Williams, administrator of the estate of Thomas H. Williams, deceased, for infringing six patents granted to Bowers. It is understood that suits are to be brought by the same attorney against several other parties for infringement of the same patents. Mr. Bowers was formerly a resident of this city, but now makes his headquarters at Washington. He is on a visit to San Francisco. A large company has been organized at Chicago to build dredgers under his patents.

## Our Agents.

OUR FRIENDS can do much in aid of our paper and the cause of practical knowledge and science, by assisting Agents in their labors of canvassing, by lending their influence and encouraging favorably. We intend to send none but worthy men.

F. B. LOGAN—Santa Clara Co.

JOHN G. H. LAMPADIOS—Monterey Co.

JOHN W. INGALLS—Arizona Territory.

WM. WILKINSON—Stanislaus and Merced Co.'s.

A. F. JEWETT—Tulare Co.

C. E. WILLIAMS—Yuba and Sutter Co.'s.

C. G. HUSTON—Montana Territory.

**COPPER SMELTING.**—In Mr. James E. Mills' article on this subject, in the PRESS of February 4th (page 67), he is made to say that "copper mining in the United States has been developed along lines of progress quite divergent from those followed in Europe." Mr. Mills wrote: "Copper smelting in the United States," etc.

## List of U. S. Patents for Pacific Coast Inventors.

Reported by Dewey &amp; Co., Pioneer Patent Solicitors for Pacific States.

From the official report of U. S. Patents in Dewey &amp; Co.'s Patent Office Library, 210 Market St., S. F.

FOR WEEK ENDING FEBRUARY 14, 1888.

R. 10,901.—GAS REGULATOR—M. J. Amick, Portland, Ogn.  
 377,801.—RUBBER HOSE—James Crompton, S.F.  
 377,743.—DEPRESSION PULLEY FOR CABLE RAILROAD—G. W. Douglas, S. F.  
 378,002.—STREET-SWEEPING MACHINE—Wm. Haas, S. F.  
 377,829.—WASHING MACHINE—N. S. Johnson, Portland, Ogn.  
 377,760.—AMALGAMATOR—W. & G. W. Johnson, Portland, Ogn.  
 378,056.—GATE—R. S. Lyon, Sonoma, Cal.  
 377,785.—DAMPER REGULATOR—Jos. St. Mary, S. F.

NOTE.—Copies of U. S. and Foreign Patents furnished by Dewey & Co., in the shortest time possible (by mail or telegraphic order). American and Foreign patents obtained, and general patent business for Pacific Coast inventors transacted with perfect accuracy, at reasonable rates and in the shortest possible time.

## The American Well Works,

Located at Aurora, Ill., are the largest in the world. They manufacture every kind of well machinery and prospect for gas, oil, water and minerals. In addition to their present productions they are mounting almost all classes of their machinery so that there is no time lost in erecting and moving from one job to another. Their encyclopaedia of well sinking appliances is very complete, which they will mail free on receipt of 25 cents, mailing charges. No one interested in well sinking and prospecting should be without this book.

WORKING ORE.—Miners who want a quartz-mill, large or small, at one-eighth the cost of stamps, should investigate the new Stiles pulverizer and concentrator, both fully tested, and which are going to get to the front and stay there. Address J. A. Johnson, 105 Stockton St., San Francisco.

## A NEW AMERICAN BOOK

## Minerals, Mines and Mining. JUST READY.

A Practical Manual of Minerals, Mines and Mining. Comprising suggestions as to the localities and associations of all the useful Minerals. Full description of the most effective methods for both the qualitative and quantitative analyses of each of these minerals, and hints upon the various operations of mining, including architecture and construction. By Prof. H. S. Osborn, LL. D., author of "The Metallurgy of Iron and Steel" illustrated by 171 engravings. In one volume, 8vo., 367 pages. Price \$4.50, by mail, free of postage, to any address in the world.

CONTENTS.—PART I. MINING MINERALOGY, AND ECONOMIC TREATMENT AND HISTORY OF THE USEFUL MINERALS. Mining Mineralogy, Preliminary Principles and Preparations, Economic Treatment and History of the Useful Minerals, Gold, Silver, Copper, Nickel, Iron, Tin, Zinc, Lead, Manganese, Platinum, Iridium, Mercury, Antimony, Bismuth, Chromium, Cobalt, Corundum and Emery, Pumice Stone, Infusorial Earth, Grindstones, Bubbles, the Diamond.

PART II. MINING WORK AND ARCHITECTURE, INCLUDING VARIOUS SUBORDINATE, WITH DESCRIPTIONS OF ASSOCIATED APPARATUS AND MACHINERY. Mining Construction and Machinery. [This part comprises 99 pages, illustrated by 165 engravings, with details too full to be comprised within the limits of this advertisement.]

Appendix. Sinking Artesian Wells, Oil and Gas Wells. Index.

27 An illustrated circular, 4 pages, 4to, giving the full Table of Contents of this volume, will be sent free of postage, to any one in any part of the world who will apply by letter.

28 The above or any of our Books sent by mail free of postage, at the publication price, to any address in the world.

29 Our New Revised Descriptive Catalogue of Practical and Scientific Books, 80 pages, 8vo, and our other Catalogues and Circulars, a whole covering all of the branches of Science applied to the Arts, sent free and free of postage to any one in any part of the world who will furnish his address.

HENRY CAREY BAIRD & CO., Industrial Publishers, Booksellers and Importers, 810 Walnut St., Philadelphia, Pa., U. S. A.

## Practical Treatise on Hydraulic Mining.

By AUG. J. BOWIE, Jr.

This new and important book on the use and construction of Ditches, Flumes, Dams, Pipes, Flow of Water on Heavy Grades, methods of mining shallow and deep placers, history and development of mines, records of gold washing, mechanical appliances, such as nozzles, hurdy-gurdys, rockers, undercurrents, etc.; also describes methods of blasting; tunnels and sluices; tailings and dump; duty of miners' inch, etc. A very practical work for gold miners and users of water. Price, \$5, post-paid. For sale by DEWEY & CO., Publishers, 252 Market St., San Francisco.

## GO TO THE OLDEST AND THE BEST.

W. B. EWER.

GEO. H. STRONG.

## DEWEY &amp; CO.'S

Scientific Press

Patent Agency.

ESTABLISHED 1863.

Inventors on the Pacific Coast will find it greatly to their advantage to consult this old experienced, first-class Agency. We have able and trustworthy Associates and Agents in Washington and the capital cities of the principal nations of the world. In connection with our editorial, scientific and Patent Law Library, and record of original cases in our office, we have other advantages far beyond those which can be offered home inventors by other agencies. The information accumulated through long and careful practice before the Office, and the frequent examination of Patents already granted, for the purpose of determining the patentability of inventions brought before us, enables us offer to give advice which will save inventors the expense of applying for Patents upon inventions which are not new. Circulars of advice sent free on receipt of postage. Address DEWEY & CO., Patent Agents, 252 Market St. S. F.

## CALIFORNIA VIGORIT POWDER CO.,

No. 40 California Street, San Francisco,

—MANUFACTURERS OF—

## NITRO-GLYCERINE

("DYNAMITE" or "GIANT")

## Blasting Powders.

Vigorit "LOW" Powder,

FOR REMOVING STUMPS AND TREES, HAS NO EQUAL.

WORKS: California City, Marin Co., Cal.

ED. G. LUKENS, Manager.

## PATENT LIFE-SAVING RESPIRATOR

Entirely Prevents Lead Poisoning and Salivation.

The most perfect appliance for people engaged in Smelting, Dry Crushing, Guano Works, Quicksilver Mines, Lead Corroding, Threshing and Stock-driving, and all other occupations where there is dust, poisonous vapor, or bad odor.

In Feeding Threshing Machines, and similar work, they are indispensable, as no foreign substances can be inhaled when they are worn.

The Respirators are sold subject to approval after trial, and if not satisfactory the price will be refunded. Price, \$3.00 each or \$30.00 per dozen. Sent post-paid to any address on receipt of price.

Address communications and orders to JOHN TAYLOR & CO., Sole Agents, 63 & 65 First St., cor. Mission, San Francisco

Send for Descriptive Circulars containing Testimonials of well known parties who are at present using them.

## THE ROLLER ORE FEEDER

[Patented May 23, 1882.]

This is the best and cheapest Ore Feeder now in use. It has fewer parts, requires less power, is simpler in adjustment than any other. Feeds coarse ore or soft clay alike uniformly, under one or all the stamps in a battery as required.

In the Bunker Hill Mill it has run continuously for two years, never having been out of order or costing a dollar for repairs.

Golden State and Miners' Iron Works, Sole Manufacturers, 527 First Street, San Francisco, Cal.

THE H. H. H. Horse Liniment puts new life into the Antiquated Horse. For the last 14 years the H. H. H. Horse Liniment has been the leading remedy among Farmers and Stockmen for the cure of Sprains, Bruises, Stiff Joints, Spavins, Windfalls, Sore Shoulders, etc., and for Family Use is without an equal for Rheumatism, Neuralgia, Aches, Pains, Bruises, Cuts and Sprains of all characters. The H. H. H. Liniment has many imitations, and we caution the Public to see that the Trade Mark "H. H. H." is on every Bottle before purchasing. For sale everywhere for 50 cents and \$1.00 per Bottle.

For Sale by all Druggists.

## HORACE D. RANLETT, Ores, Mining, and Commission,

420 Montgomery St., S. F.

BUSINESS MANAGER OF

UNION COPPER MINE, Calaveras Co., NEWTON COPPER MINE, Amador Co. Correspondent as Agent for Smelters in London, Liverpool, New York, Boston and Baltimore.

Twenty years experience, in California, purchasing Ores and dealing in Mines.

Special attention given to management and sales of mines and purchase and shipment of copper produce.

## QUARTZ MINES FOR SALE.

Under good bonds, several first-class Gold Quartz Mines, located in Amador county on the true lead; well developed and ready for mills. Samples and all particulars at office of the above.

## WINCHESTER HOUSE,

44 Third Street, San Francisco, Cal.

This Fire-proof Brick Building is centrally located, in the healthiest part of the city, only a half block from the Grand and Palace Hotels, and close to all Steamboat and Railroad Offices.

Laundry Free for the use of Families HOT AND COLD BATHS FREE.

Terms, Board and Room, \$1.00 per Day

And upward. ROOMS WITH OR WITHOUT BOARD. FREE COACH TO THE HOUSE. J. POOLEY.

## FOR SALE.

A Complete Ten-Stamp Mill (NEW),

Suitable to work free-milling or sulphureted ores. Will be delivered on board cars at Merced, if desired. Address

F. T. HOUGHTON, Hornetoe, Cal.

## San Francisco Cordage Factory.

Established 1858.

Constantly on hand a full assortment of Manila Rope, Sisal Rope, Tarred Manila Rope, Hay Rope, Whale Line, etc., etc.

Extra sizes and lengths made to order on short notice

TUBBS &amp; CO.

MACHINE.**

IT DIFFERS FROM THE OLD STYLE IN HAVING ONLY ONE JOINT instead of two. It is of greater capacity and more easily worked and kept in repair. The statement of Mr. Hendy that all styles are infringements on the machines made by him, he knows to be utterly false. All litigation has been in reference to old style two jointed machines, which are superseded by our new style one jointed. The decision of Judge Sawyer, referred to by him, is carried up on appeal to U. S. Supreme Court, with absolute certainty of a reversal in our favor. Miners and intending purchasers are hereby notified that we are the sole owners of the patents covering this style of Giant; we will prosecute to the fullest extent of the law manufacturers or users of an infringement.

# \$1,000 CHALLENGE ACCEPTED, PRICE, FIVE HUNDRED AND FIFTY DOLLARS (\$550.00).

**THE  
"TRIUMPH" ORE CONCENTRATOR.**

The present improved form of the celebrated "TRIUMPH" Ore Concentrator possesses many advantages over any other style of Vanners, Vanning Machines, or Concentrators, yet introduced to the notice of mining men. These advantages consist in the superior features which enter into their construction, and facilitate their operation.

They are constructed in the best manner; their frames being of iron, insures their solidity, durability, and perfect steadiness of motion when operated. They are built as compactly as their requisite strength will permit, weigh less, require less freight space in boxes, by which their cost of transportation is reduced, and occupy less mill room when set up.

An important improvement has recently been introduced into their construction, which consists of a RIFFLE TABLE placed in front of and which takes the discharge from the feed and amalgam bowl. The improvement is in the reciprocal motion which is imparted to this table by the longitudinal motion of the shaking frame to which the table is attached. We have at hand many testimonials, from well-known Superintendents of mines in different mining districts of the United States, bearing evidence of the efficiency and superiority of this form of Concentrator, and we shall be pleased to send Circulars covering such letters of testimony, and, as well, directions for setting up and operating these machines, and are ready to quote special prices for any considerable order.

## Metallurgy of Zinc.

In the world's production of zinc the United States now stands third on the list. In 1886 the production was as follows: Belgium, 129,020 tons; Silesia, 81,000 tons; United States, 38,072 tons, and Great Britain, 20,750 tons. The principal ores used in the United States are calamine and "black jack." The average per ton of these ores is from \$18 to \$20 per ton, but the silicates of zinc bring only about \$10. The furnaces principally used are those of the Belgian system; retorts 8 inches in diameter and 48 inches long.

The reported discovery of rich zinc mines in some of the United States, and the utilization of the ores, induces us to collect what facts are available respecting the metallurgy of zinc, thinking it may be both useful and interesting to our readers.

The principal ores of zinc need in distillation are calamine, or the carbonate of zinc, and blende, the sulphide of zinc, called by some of the English miners "black jack" or "brown hen." The other ores found in quantity are the red oxide and the silicic oxide.

The furnaces used in England are very similar to those used in glass factories for the fusion and preparation of glass. These furnaces are either square or round, and that represented in Fig. 1, and which is usually preferred, has the latter form. The fire-place, *F*, is raised to a convenient height above the surface of the ground, and is situated in the center of the arrangement. Around this are disposed the crucibles, *c*, into which is charged the mixture of ore and fine coke from which the zinc is to be distilled. The dome, *d*, is pierced with openings by which the mixture of powdered ore and coke is introduced, corresponding to each crucible, and the bottom of each pot is furnished with a hole in connection with an iron tube, *t*, which traverses an opening left in the side of the furnace, and thus projects beneath the floor into a chamber placed immediately below it. The upper orifice of this tube is loosely closed, previous to the introduction of the charge by a wooden plug, which, being converted into charcoal during the operation, is rendered efficiently porous to admit of the passage of the vapor of zinc, but at the same time prevents the escape of the small coal and calcined mineral.

Each crucible is covered with a lid, luted with fire-clay, and the distilled metal is condensed in the tube *t*, and falls in the form of drops in the vessel *r*. As these tubes are liable to become choked by the condensed metal, a long iron rod is used to clear them occasionally to prevent explosions. The zinc collected in this operation in the form of drops and very fine powder, mixed with a certain portion of oxide, is afterward melted in a large iron pot, set in brickwork and heated by a fire beneath. The drops which collect on the surface of the fused metal is skimmed off and returned into the crucibles in a succeeding operation, the zinc being cast into ingots. Five distillations may be made in a furnace of this kind in 14 days, in the course of which 8 to 10 tons of roasted ore are treated, and from 28 to 30 tons of coal consumed. The metal obtained commonly amounts to from 35 to 40 per cent of the ore treated, and the duration of each crucible is about four months.

The preparation of zinc at the Vieille Montagne, in the neighborhood of Liege, is minutely

described by Rognaut in his "Chimie Elementaire." The ore is divided into two classes, and the mineral, after being washed, is calcined in conical kilns, similar to those employed for burning lime. The oven in which this is conducted are heated by two lateral fireplaces, covered by an arch and provided with a flue, which is divided a short distance from the hearth and enters the kiln by 20 different apertures, arranged at regular intervals. The

is placed beneath the surface of the ground, and the flame and heated air enter the interior of the furnace through four apertures, *e*. In the arch are placed two separate flues, *G, G*, which terminate in a central chimney, *C*, divided into four compartments and closed by dampers, *D*, corresponding to each division. In each of these furnaces are placed 42 cylindrical retorts, *r*, closed at one of their extremities and made of refractory clay. These are

Fig. 1.

ENGLISH ZINC FURNACE.

Fig. 2.

Fig. 3.

BELGIAN ZINC FURNACES.

operation is continuous, and the roasted ore, after its removal from the kiln, is ground, sifted and sent to the furnace in which its reduction is effected.

The reducing apparatus consists of four distinct furnaces united in one mass of brickwork. Each of these has the form of an arched recess, *A* (Figs. 2 and 3), whose greatest height is 8 feet 8 inches above the floor. The back of this opening is composed of a brick wall, and is slightly inclined in the direction *a, b*; the face, *c, d*, is on the contrary left, quite open for the introduction of the retorts. The fireplace, *F*,

3 feet 8 inches in length and 6 inches inside diameter. In the open end of each is introduced a conical adapter of clay, *o*, 11 inches in length, and on this, which forms the mouth of the condenser, is fitted a cone of wrought iron, *p*, of which the smaller end does not exceed an inch in diameter. The earthen retorts are placed in the furnace in eight rows raised one above the other, and with this view the back wall of the oven (Fig. 3) is furnished with as many successive steps or projections, on which are supported the closed ends of each row of tubes.

On the open face of the oven *c, d*, are arranged

eight plates of cast iron, which are fastened in their places by being fixed on the masonry, and are destined for the support of the outer end of the retorts, to which are attached the adapters. The retorts are given a regular but slight inclination downward, by which the distillation and removal of residual matters is facilitated. This furnace will run two months before relining is necessary. It takes about four days to heat it up.

When the retorts are arranged in the oven a small charge of powdered ore and charcoal is at first introduced, and these are increased for three or four days until all are working regularly. Two charges of the furnace are worked off every two hours. A detailed description of the process of distillation in this furnace is given in Phillips' Metallurgy.

## Lower Springs District.

We had a conversation this week with Mr. G. C. Frick of Lower Springs District, Shasta county. Mr. Frick is owner of the Grotefend mine, near Redding. Some of the quartz shown us from this mine looks very favorably, free gold being visible in most of it. They are down on the mine 35 feet. The Daniels company some nine years ago took out \$9000 within a hundred feet of where this ore came from. They supposed then they had worked the claim out. The quartz shown us came from the new shaft.

In this district they strike water at a depth of about 35 feet. The district being a little "pockety" is not as prosperous as its merits justify. The veins are large and run east and west. The Muchmore mine or Miller mine is the most important in the district, and the only one where systematic developments have been carried out. The greatest depth reached in the camp until Mr. Miller came was 45 feet, but he is now down 160 feet on the Muchmore. He has a 10-stamp mill which crushes ore from the mine. The ledge is a little small at the bottom of the shaft. In a winze about 100 feet west of the old workings they have got very rich ore.

The Eureka and extension of the Miller has good rock. Mr. White has the Whiteoak and Eastern Star, both of which are fine prospects. The miners are mostly poor men, and are unable to develop their properties. They need the help of capital to open their mines. The sulphurets in the rock are rich, and often good strikes of free gold are made. But capital is needed to develop the mines, purchase machinery and work the ore. The Kempton reduction works in the same district, near Redding, and on the old Shasta road, are in litigation, and land troubles have kept them back.

Most of the miners in the district are pocket-hunters and only work for surface pockets. If they had more money to go on with they would doubtless open up some very good mines.

**MECHANICS' INSTITUTE.**—There was no opposition to the regular ticket at the election of the Mechanics' Institute in this city, and the following trustees were chosen to serve two years: David Kerr, J. A. Baner, A. W. Starbird, D. A. McDonald, Geo. H. Hoppe, A. W. Scott.

**THE Montana Smelting Company** has closed a contract with the Great Falls Water-Power Company of Montana, and will erect a large smelting plant at Great Falls on the Missouri.

## CORRESPONDENCE.

We admit, unendorsed, opinions of correspondents.—E.D.S.

## San Bernardino County Mines.

[From a Correspondent.]

Since the demise of the *Calico Print* this county has not received the attention that its mining interests deserves at the hands of the average newspaper man, the boom in lands, no doubt, occupying their best energies.

During the last past year considerable profitable mining has been carried on, and probably the largest and most wonderful

## Gold Deposit

Ever discovered in the State was made in this county. Black Hawk mountain is a spur of the San Bernardino range, and is situated about 30 miles east of Victor station, on the California Southern R. R. This mountain has long been known as a mineral mountain. A large amount of prospecting has been done in former years, especially for lead and silver ores. It has remained for O. G. Leach and I. B. Cook, well known prospectors, to unearth this extraordinary gold deposit. The ledge carrying the gold ores is some two miles in length, running northerly and southerly, and dipping to the west at an angle of about 25°.

The vein is from 10 to 40 feet in width with a splendid bed or footwall of porphyry and a hanging-wall of stratified lime strongly impregnated with iron. The character of the contents of the ore ledge I cannot easily define, it being new to me; it is largely decomposed (probably one-half of the whole mass) and carries what some experts call impregnated lime spar. At any rate, the whole mass shows gold freely by panning.

This interesting ledge has some most extensive chimneys of ore. I will endeavor to give your readers an idea of its magnitude from personal inspection. There are eight locations on the main ledge—Santa Fe, Hecla, Pinon, Look-out, Senator, Black Hawk, Cliff, and Gem, nearly all having been prospected by the owners.

## The Santa Fe Claim

Is the highest location and farthest south, being about 6000 feet above the sea level. It shows a chimney of ore from 400 to 600 feet in length and 25 to 35 feet in width; this mass, as far as I sampled, should average \$8 per ton.

The Hecla, a smaller vein a couple of feet in width and about 50 feet uncovered, samples about \$50 a ton. The Pinon, with small openings, shows pannings of about \$10 per ton. I now come to the most wonderful chimney of ore I ever witnessed.

## The Lookout Mine

Has been opened by nature by an immense washout creating a canyon some 400 feet deep, cutting the ledge its full length, exposing the largest chimney of ore probably on the coast. This chimney is at least 1000 feet in length and is from 15 to 40 feet in width. Your correspondent sampled here and there for its full length, and should judge by numerous pennings that it will average from \$10 to \$15 per ton, many small veins from two inches to two feet sampling as high as \$100 per ton. The owners are now opening this ledge by terracing faces and running cuts. About the middle of the claim I sampled one of these terraced faces for 40 feet in width, and I should judge it to be a \$15 a ton prospect.

The Senator claim shows another large body some 300 feet in length and about the same width, but does not give as large pannings, probably \$6 to \$10 per ton. The Black Hawk is as yet unprospected. The Cliff claim shows some rich ore from \$40 to \$60 per ton, and the

## Gem Location,

Being the farthest north and the last location on the ledge, shows a 30 foot vein; the upper or hanging-wall for 12 feet will probably sample \$15 per ton. The lower portion of the ledge does not sample as well. C. & L. are running a tunnel on this claim, commencing on the porphyry, but as yet are not in far enough to strike the pay streak. The owners have been lucky in making their find, as it is just outside of the snow belt, and wood and water in abundance within short range.

## Calico Mining District.

Although the heavy mining suits between the Runover and Oro Grande mining companies lock up several important mines, Calico's output of bullion is quite large; all the mills (55 stamps, I believe) are pounding away, and the new 60-stamp mill of the Oro Grande Company for the working of the ore from the Waterloo mine is expected to be in full blast by the first day of April. At one time it was feared that the mines of this district would not go down, but it has been demonstrated that this was erroneous; several of the mines have been developed past the stage of uncertainty as to depth.

## Holcomb Valley Mining District.

The Valley Gold Company, an English incorporation, bought a large portion of the placer basin of this valley with a view of bed-rocking and working the gravel. They had some 20 men at work during the past summer, but only succeeded in getting the depth of 50 feet; they passed through some rich gravel at the depth of 35 feet, and are now only waiting for the snow to clear off to commence work with increased vigor and better machinery. Should they be able to reach and work the bed-

rock gravel, there is not much doubt but they will receive rich rewards. I. B. Osborne, owner of several mines and mill, commenced work late in the season, but thought it best to shut down during the severe winter months.

## Providence Mining Camp.

Kerr & Patton, who own a five-stamp mill, are running on some high-grade ore.

The old Bonanza King Company still lets its property lie idle, although their mines never showed more ore in sight than at present. They have also a large lot of rich tailings ready to be put into bullion. Whether it is the freezing out of the small fry or the depreciation of bullion that causes the continued delay in commencing operations, the writer knoweth not. Several other important properties there are also lying idle.

## Mescal Mining District.

The Cambria Mining Company of Los Angeles has a fine ten-stamp mill on its property and the mines are keeping the mill running night and day on 50 to 60-ounce ore. The rock from these mines is very hard, the mill not being able to crush over 1½ tons to the stamp in 24 hours. Several new finds of silver ore are reported in the near neighborhood. The prominence lately given to the building of the Los Angeles & Salt Lake railroad, which is intended to run through portions of Death valley, has brought into prominence the base metal mines near Soda lake. It is reported that some of the capitalists of San Francisco have bought several interests in that locality, and that they will at once commence operations. Mrs. Riggs, who owns Joe Dandy hill in that district, holds her properties at figures in the hundreds of thousands. The property is certainly very valuable, should the railroad run in its vicinity. The Joe Dandy hill is covered with rich carbonates.

San Bernardino county abounds in several other productions, iron, marble, stone quarries, borax, salt, and lime being largely operated, which will be a subject of a future letter.

Victor, San Bernardino Co.

## Preparatory Calcination of Silver-Lead Ores.

(Written for the PRESS.)

The practice of feeding raw galena ores (sometimes in the form of concentrates) into the blast furnace, even when the iron necessary to free the lead must be charged as barren flux, still survives in some parts of this country.

This method is only admissible when very pure ores are concerned and where iron in a convenient form is cheap. It should never be resorted to with ores containing other sulphurets, or combinations of arsenic, antimony and zinc.

The process of precipitation smelting, as it is termed, has been abandoned in Europe with very few exceptions in favor of preparatory roasting of ores. In other words, it has been found more economical to roast off the sulphur and other volatile ingredients before charging the ore into a blast furnace, than to precipitate the lead out by combining said sulphur with iron in the smelting process. Apart from the advantages derived from the use of cheap fuel in expelling the volatile elements, thereby reducing the work to be performed later by the more expensive coke or charcoal, the ore reaches the blast furnace in a better condition for rapid work. At the Winnamuck works in Utah, Mr. Wartenweiler found that by replacing with roasted material the hematite ore he was using as a flux, he could increase the weight of his charge by about one-third, and at the same time effect a reduction in the quantity of fuel used, approximately 28 per cent.

The troubles which invariably occur from charging "lines" into the blast furnaces may be mitigated to a great extent by slagging down the roasted material on the last hearth of the calciner, or even by bringing it into a pasty condition before withdrawing. At Tarnowitz it was found that by slagging, five or six times more "lines" could be put through the blast furnace than had been previously possible.

The dangers from accretions forming in the hearth, caused by iron being precipitated out of the charge in the metallic state, or from volatilized sulphides accumulating on the walls of the furnace above the smelting zone, are greatly diminished, and the fall of by-products, matte, speiss, etc., reduced to a minimum.

At Příbram in Bohemia, when the precipitation process was employed, the matte fall amounted to 70 per cent of the ore charged. This was reduced to 1 per cent by abandoning the process and resorting to preparatory roasting. At Winnamuck the fall was about equal to the lead bullion produced, which in case of galenas or other heavily sulphureted ores is usually in excess of 50 per cent of ore charged. Considerable expense and loss is incurred in the subsequent handling of this material.

The thorough decomposition of lead sulphide by iron requires a higher furnace temperature than that necessary for the ordinary reduction of calcined ores, therefore consumes more fuel; besides, silver follows the sulphide of lead into the matte, forming a richer product (with reference to lead contents) than the lead bullion itself. At Příbram the losses in metals were heavier when the precipitation process was in use than after preparatory roasting was substituted for it.

The silver contents of lead mattes vary con-

siderably. Some examples from the upper Hartz ran from 6 to 35 ounces per ton of 2000 pounds, others from Freiberg from 28.8 to 58.6 ounces, while at the Winnamuck works it went as high as 70 to 80 ounces.

The first of above examples was formed in the iron precipitation process, the second and third in the smelting of roasted ores; but the great difference in bulk of matte produced by the two methods of treatment amply offsets the apparent advantage which the former may possess in regard to value.

To illustrate the fallacy of treating galenas in the raw state in a blast furnace, the case of an ore carrying 55 per cent of lead in the form of sulphide may be examined. The theoretical amount of sulphur combined with the lead is 8.52 per cent of the ore.

To take up this sulphur would require .1492 per cent of the weight of the ore in metallic iron to form sulphide of iron (Fe S). In estimating the requisite amount of iron necessary to bring about this reaction it is not safe to assume that any material quantity of the sulphur will be otherwise disposed of in the reducing atmosphere of the blast furnace than in combining with iron and lime.

Usually the matte formed shows a greater relative proportion of iron to sulphur than is exhibited in the above formula, so that to insure a proper reduction of the lead, metallic iron amounting to at least 20 per cent of the weight of ore must be provided.

Assuming an iron ore to be available carrying 60 per cent metallic iron, and that it costs \$6 to pass a ton of smelting mixture through the blast furnace, for every ton of lead ore smelted one-third ton of iron flux will be required for no other purpose than to reduce out the lead. The reactions are not so complete but that considerable of the PbS escapes decomposition, which, with the surplus iron absorbed by the matte and the other matte-building constituents of the ore, combine to form a mass approximating in weight 50 per cent of the ore charged, or, in other words, one ton of matte is produced for every two tons of lead ore smelted.

This matte requires subsequently two heap roastings (often more), which consume a considerable period of time and cost approximately \$2 per ton treated. Mr. Terbune, in a paper read before the American Institute of Mining Engineers, places the cost of heap-roasting 5134 tons of matte at the Hsnauer works, in Utah, at \$2.25 per ton.

Unless the heaps are carefully picked over a number of times and the partially roasted material subjected to repeated burnings, the product is at best a mixture of partially oxidized compounds, sulphurets, etc., requiring a considerable portion of its iron contents for its own decomposition.

Assuming that coke costs \$20 per ton delivered, and that 400 pounds are used to ton of smelting mixture, we arrive at the following comparative cost of the two methods:

	By iron precipitation.	By preparatory Roasting.
Cost of calcining 1 ton ore		\$4 00
" " " " " "		6 00
" " " " " "	\$9 00	
" " " " " "	2 00	
" " " " " "		1 00
20 per cent of expenses saved by rapid smelting consequent upon preparatory roasting, etc.	0 40	
25 per cent fuel saved....	0 80	
Total cost of smelting 1 ton ore.....	\$12 20	\$10 00

There is, therefore, in the case selected for illustration a saving of 20 per cent effected in the cost of treatment by preliminary calcination over treatment in the raw state with hematite iron. Under favorable conditions this difference may become more marked, and only rarely can the reverse be demonstrated in the case of class of ore under consideration. The interest on capital tied up in the construction of proper roasting plant is offset by that used in carrying roast heaps, while in both cases the metallurgical losses are practically the same. In how far a preparatory roasting is advisable for other classes of ores is a matter for careful consideration in each individual case. A great deal depends on the proper construction of calciners, marked results being often accomplished by apparently trivial details of construction. There is no question but that ores which are often smelted in the raw state could be advantageously subjected to a preparatory calcination. Dr. G. Klupfel gives as an instance of the saving effected in fuel the case of a German iron furnace by preparatory calcination of the ore 13 per cent (Stahl und Eisen, 1883, No. 12). Percy states that the saving of fuel effected in the old Wellner furnaces at Freiberg by sintering the ores was 12.62 per cent, while 62.65 per cent more material could be put through the furnace in this form than when the ore was not sintered.

W. L. AUSTIN.

Toston, M. T., Feb. 10, 1883.

BORING for natural gas has been resumed on the land of Simon L. Jones, in the range of hills back of Searsville, San Mateo county. A contract has been made with a Mr. Bodwell, who has made successful borings on the ocean side of the same range to the depth of over 800 feet, obtaining both gas and oil at various depths. The boring will be done on Mr. Jones' place with a steam engine, a positive contract for the first 500 feet having been made, with two additional but contingent contracts for 250 feet each, if the owner so desires.

## Tuolumne County Mines.

EDITORS PRESS:—Below I give a description of some mines located three miles east of Soulsbyville. Most of them were worked in early days when only ore in soft ground was stoped out and supplies and machinery were high.

They did not go into hard rock unless the veins were very rich, and as soon as the ore in soft ground was stoped out the mines were abandoned and shafts, drifts, etc., allowed to cave in. Many mines here where the ore was low grade and would not pay in early days would now yield handsome dividends to the men who have the capital to reopen them. If any capitalists want any further information of any mines mentioned in my letters to the PRESS, I am always ready to favor them, knowing that there are many good mines in the county if there was capital invested to reopen them.

My first visit was to the North Fork mine, situated on the Buchanan mine road. It is one of the best mines lying idle in the county. The owners have not the means to open it as it should be. It is in a slate formation. The first chute of ore was worked down to water level (80 feet) in early days. It was considerable over 100 feet in length; average width of vein, 18 inches or two feet, and paying \$60 per ton. They only had a windlass to do the hoisting, machinery being at that time very expensive. They were poor managers and work was suspended. The second chute of ore, now in sight in the tunnel, runs up to three feet and goes \$13.50 to the ton.

The third chute is 18 inches and prospects splendidly; 900 feet from the last mentioned chute a shaft has been sunk. The vein at this point is 12 inches to one and one-half feet; ore yielded \$15 per ton. It can be seen by the description that it is a good property. The owners inform me that they are willing to hand and give time to prospect it before paying any cash down. All that is required is to open the first chute and erect a mill and then it will pay its hundreds per month dividend. I hope to see this mine working in full blast before many months.

My next visit was to the Tront mine. There is a vein showing from 18 inches to five feet in width. I place the ore at about \$10 per ton, and perhaps it will go more than that. There is a difficulty among the owners and they cannot agree in working it, and I understand it is for sale at a low figure. I think it would make a good property if mining men with capital would take hold of it. There is an abundance of free timber and water for mining purposes. It is supposed by some to be the extension of a mine where hundreds of thousands have been taken out.

The Rising Sun mine is still closed down. There is a fine mill and hoist on the mine which is run by water-power. Rich ore has been taken from this mine, but the chutes are very short. My opinion is in depth the chutes will lengthen and make it a paying property.

At the south of the Rising Sun is the Eaton. It is worked on a small scale by Chinese labor. The vein is small, but where it is opened at different points the ore is very good.

F. Prudhomme is working his mine and has got a very good property, but is getting down too deep for a windlass to do the hoisting, and water is a great drawback.

I am informed that one of the veins struck a short time ago in the Basin mines has widened out to six feet, with very fine ore. This mine is coming to the front, after lying idle for several years. And there is no doubt in my opinion but what it will be the best mine in the county when fully developed.

In the future workings a tunnel should be driven from the river. At least 1000 feet of "backs" can be had by working it in this way, and in the river there is an abundance of free water for milling purposes. A tunnel driven from the river would probably cut other veins known to exist on top, where some very good ore was taken out.

The Last Chance mine, which was worked in early days, is still at a standstill. It is said that a vein 18 inches to 2 feet was left in the bottom workings of the mine. There has been some extremely rich ore taken out, and it is said that the sulphurets are rich. The owner is a poor man (like many others) and has not the means to open and retimber the shafts.

The Blue Lead, Virginia and Funk mines are also idle. Good ore has been taken out of them, but in early days.

Mr. Patterson of St. Louis, and director of the Black Oak Mining and Milling Co., at Soulsbyville, has returned East, after a few weeks' visit to the mine. I understand he will return here again soon, accompanied by his family.

Soulsbyville, Feb. 21, 1883.

THE shipwright report work plenty, none of their members being idle at present. Several steam schooners are now in process of construction in the San Francisco shipyards. Frzier & Hanson are building two, White two, Boole & Beaton three and Hayes four. Hinkley, Spiere & Hayce are said to have contracts to build about a dozen more of the same class of vessels. Shipbuilding seems to be tending more and more in the direction of steam to the exclusion of sailing vessels. At the present time no sailing craft are being built at the shipyards in this port.

# Electric Pumping in Collieries.

## Comparison of Steam, Electricity and Hydraulics.

The following paper was recently read by Mr. Frank Braio before the South Wales Society of Engineers, Cardiff, and published in the *London Mining Journal*:

Before electricity is adopted by practical mining engineers, they must be convinced that it can compete economically with other modes of transmitting energy-modes, which are well known and generally applied. What percentage of indicated steam-power applied to the generating electric machine is given off, ultimately, as available energy for mechanical work? How does it compare as to cost? Under what circumstances would its application be economical? If leading main questions, such as these, can be plainly and satisfactorily answered, practical men will not be long in arriving at a favorable opinion and acting upon it. The application of electricity to underground pumping has enabled the writer to tabulate some particulars which he believes will go a long way toward satisfying inquirers that this is a method of transmitting energy capable of wide and economical adaptation. Some four years ago (Vol. 13, No. 5) Mr. W. B. Brain described to this institute in a short paper a small electric pumping plant at Atrafalgar colliery, Forest of Dean, doing the work of about 1½-horse-power. This, the writer believes, was the first attempt ever made at pumping in mines by electricity. It has continued working satisfactorily up to the present time. A similar set using about 2½-horse-power has been working in another part of the mine, some 800 yards from surface, for the past 1½ years. Both are doing excellent service, removing small quantities of water from remote parts of abandoned workings, which for the safe working of the colliery must be kept free from accumulations of water. It may be well to say the majority of the collieries in the Forest of Dean have their shafts sunk on the "rise" of the taking, and the coal is won by "dipples" or engine planes going full dip with the strata. The outcrop is riddled with old abandoned workings. These receive a great quantity of surface water, which finds its way down the slope of the strata to the deeper workings now in operation. The two electric pumps above referred to intercept some of this water on its downward course. The electrical pumping plant which the writer purposed describing in this paper has been put into deal with the main cause of water in the deep workings of the Atrafalgar colliery.

### The Pump and Motor

Are placed a distance of about 1650 yards from the bottom of the shafts, and the water has to be forced by this pump a vertical height of 300 feet to the pit bottom. This water had previous to May last been coped with by one of Hathorn Davey's water-power pumps, working in conjunction with a 7-inch double plunger Manchester Pearn pump with 10-inch steam cylinders and 14-inch stroke, the steam being obtained from the tubular boilers fixed underground. The present pump—a double 9-inch plunger with 10-inch stroke—has been specially designed by the Lilleshall Iron Company (Limited) from sketches furnished by the writer, and is fitted with spur gearing running 6 to 1. It is driven by a leather link belt running off a 5-foot 4-inch pulley, keyed on the same shaft as the spur pinion to a 14-inch pulley on motor shaft. Thus, when the motor is running at about 650 revolutions per minute the pump is making 25 revolutions. The motor supplied by Elwell-Parker (Limited) of Wolverhampton is described as one of their 12-inch machines, maximum speed about 650 revolutions per minute, output about 13,000 watts. The electric current is conveyed to it by a copper cable 2000 yards long, 19-16 wires, wrapped with compounded tape, and was supplied by the India-rubber, Gutta-Percha and Telegraph Works Company (Limited), Silvertown. This is inclosed in wooden boxes in the pit shaft only. It is supported upon earthenware insulators, placed at intervals of about 10 yards along the side of the underground roads. The return cable is an old iron-pit rope, about 4 inches in circumference, stapled to the road posts.

### The Generator

Placed on surface near the top of the shaft, is another of Elwell-Parker's 12-inch machines. Its maximum speed is about 950, and output 17,000 watts. A belt communicates the power from a 12-inch pulley on the generator to a 5 foot 11-inch pulley attached to the crank shaft of an engine. The steam engine has a single 16-inch cylinder with a 12-inch stroke and works with about 35 pounds steam pressure. It is an old marine engine, picked up some time since at an auction sale, and is not what one would purchase new for the work. It indicated running empty a loss of five horse-power, the valves and piston being both the worse for wear. In the same engine-house is another engine which supplies the power for the two small electric pumps previously referred to. The steam for both is obtained from the range of colliery boilers near. A small insulated copper wire, connected to a battery of eight No. 3 Leclanche cells connects the engine-house with the pump-house underground, and through this is registered, upon a belt in the former, each stroke of the pump. It is also used as a telephone line, so that a conversation can at any time be carried on between the engineman on surface and the man in charge of the pump un-

derground. The two smaller pumps are locked up with no one in charge, only being visited occasionally, but with this larger one some one is thought necessary, although there is rarely anything more to be done than oil the machinery, adjust the machine brushes and turn on the electricity. Near the engine the necessary electrical instruments, a voltmeter and an ammeter, are placed, by which the engineman knows the machines and cables are working properly. A magnetic out-out is also placed in the main circuit, so that should the current, through any unforeseen cause, increase, it automatically breaks the circuit, thus preventing the flow of electricity through the cables. The maximum speed at which the pump has been driven is 25 strokes (114 gallons) per minute. The observations taken at the time were:

Indicated horse-power of steam engine.....	29.49
Speed of generator.....	900
Volts (at terminals of generator).....	320
Amperes (at terminals of generator).....	43
Speed of motor.....	650
Volts (at terminals of motor).....	260
Amperes (at terminals of motor).....	43
Actual horse-power of water lifted.....	10.30

The first diagram exhibited is prepared from the above figures, and shows the total loss of power—19.13 horse-power, to be apportioned thus:

Loss in engine.....	4.40 horse-power, or 22 per cent
Loss in generator.....	4.56 " " 23 "
Loss in cables.....	3.45 " " 18 "
Loss in line.....	3.00 " " 15 "
Loss in motor.....	3.60 " " 19 "
Loss in pump.....	1.63 " " 8 "
Total.....	19.13 65

### The Actual Proportion of Power

Given off by steam used to lift water is therefore 35 per cent. A second diagram shows the percentage of useful effect extracted from the power received at each stage, together with the percentage of loss—thus, horse-power indicated by steam engine 29.49.

H. P.	Per cent.	Useful effect pr. ct
Rec'd by generator 23.00; loss in steam engine.....	22	78
Rec'd by cables....18.44; loss in generator.....	20	80
Rec'd by motor....14.90; loss in cables.....	20	80
Rec'd by pump....11.90; loss in motor.....	20	80
Rec'd by water....10.36; loss in pump.....	14	86

A third diagram shows the loss between the power given off at the belt of the steam engine, and the actual work done thus:

Horse-power given off to generator.....	23
Loss in generator.....	4.56 horse power, or 20 per cent.
Loss in cables.....	3.45 horse power, or 15
Loss in motor.....	3.60 horse power, or 15
Loss in pump.....	1.63 horse power, or 7
Total.....	19.13 65

The proportion of power given off by belt used to lift water is, therefore, 45 per cent. As to cost, this writer has been to considerable pains to verify the following figures, knowing that with business men this is the crucial test. The following is a summary of the first and of the plant:

Two electric machines.....	£310 0 0
Insulated copper lead.....	138 0 0
Return wire iron rope.....	25 0 0
Signal wire.....	10 0 0
Insulators.....	5 0 0
Steam engine (estimate).....	140 0 0
Fixing and sundries.....	15 0 0
Total.....	£614 0 0

The pump (130½) and pipes are not added to the above, seeing this item of cost would of necessity be part of any set of plant, and it would, therefore, be an item of cost common to all systems.

Detailed cost of pumping 114 gallons per minute with above machinery through 1300 yards seven-inch pipes—main rising 300 feet—one week's pumping, 22 hours per day:

Engineers (half time).....	£1 8 0
Men underground (full time).....	2 9 0
Small coal consumed—say, 36 tons, at 1s.....	1 16 0
Oil, waste, and sundries.....	0 7 0
Say 15 per cent.....	1 17 0
Total.....	£7 17 0

Cost per horse-power raised .02 of a penny. Cost per 1000 gallons of water raised 1.80 pence.

The come of water in the deep workings of the colliery has been much below the average during the past dry autumn. The pump has therefore been usually worked at about 64 gallons per minute. The results, of course, not being so good, are as follows: Proportion of power generated used to lift water 32 per cent; cost per horse-power in water raised 0.3 of a penny; cost per 1000 gallons of water raised three pence.

When opportunity offers and the hold of water is pumped out, this plant is utilized to assist in

### Maintaining the Ventilation

Some 1200 yards underground a small fan passing some 10,000 cubic feet of air per minute is placed in a return air way. A branch connection is made from the main cable to a dynamo which drives the fan by belt connection. The cost of maintaining the present plant, compared with that it has supplanted, shows an economy of about 470l. per annum. This the writer does not, however, rely upon as a fair comparison of cost, seeing the former plant had to be worked under most disadvantageous circumstances. The whole of the plant was supplied by the various makers to specification, and was put in by the colliery mechanics without any outside assistance. It commenced working without a single hitch, and has worked continuously since the end of May last with but one accident. This—strictly speaking—cannot be spoken of as an accident.

A couple of weeks ago we found much more current was being taken to do the ordinary work than usual, and on examination traced the cause to the cable in the pit shaft. Here, as already explained, the cables, which are not highly insulated, are carried in wooden troughs. The late continuous heavy rains had very much increased the feeders of water in this shaft, and this water, finding its way into the boxes, saturated the cable, causing a great escape of electricity. A lead-covered cable was substituted for the ordinary one, and the difficulty was thus completely overcome. The cable was a matter of some anxiety when the plant was being provided, as the writer feared that falls, which cannot be prevented on underground roads, would be constantly damaging it and causing delays. In practice this has never been yet found to occur. With the one line indestructible (as the iron pit rope practically is) the other, should it be damaged, can quickly and easily be repaired, or replaced with new, so that this, one of the most formidable of the anticipated difficulties, has proved quite illusory. The plan which has been adopted of supporting the cable upon earthenware insulators has proved a good one—more perfect insulation—a very important factor being obtained. The repairs necessary to the side timber of the roads, along which the cables are suspended, is also facilitated.

### The Commutators

Are the principal electrical wearing parts, and with care these will run a considerable time. In this instance, after five months' work, the wear shown is only about 1-16th of an inch, although there is an inch thickness of copper to be worn away before it is necessary to have a new one. With a spare armature kept in hand, which costs about one-third the price of a machine, no accident can happen which the colliery mechanics cannot repair, and that with little delay, everything being simple in construction and easily to be got at. It is an advantage which colliery managers will appreciate to concentrate work and have it under personal supervision. Given efficient engine power, any reasonable number of generators can be driven in one engine-house on surface, delivering power to distant places underground at various points of the compass. These dynamos would require but one man to attend to them, and the work done could, with ease, be supervised. The steam, too, can be generated at least possible cost under such circumstances, and with the work divided between two or three engines, a breakdown with either—should it occur—need not cause any delay. It is especially noticeable that this plant can be put down economically and with great dispatch. With pipes carrying steam, compressed air, or water, it is often necessary to place them in ditches specially made at considerable expense along the sides of the underground roads so as to protect them from injury, and keep them out of the way. The outlay in pipes is also great, more especially when the route is devious, and if the roads are at all given to "puck," these are constantly being broken. With electro cable none of these difficulties occur. No matter how intricate the route may be, 1000 or 2000 yards can be put to work in as many hours as it would require weeks to put in pipes. Given a pump with the necessary suction and delivery pipes fixed one mile underground, with steam-power available on surface, and it would be practicable to have that pump in work in less than a week—an impossibility with any other method. The drawing attached gives a side view of the generator in the surface engine-house, and of the motor and pump in the underground engine-house, together with a plan of the latter. Another one shows the method of suspending the cables.

A few brief extracts from papers already put,

### Comparing the Cost

Of electricity with the power derived from steam, compressed air or hydraulics, may be interesting.

The following is given by Professor Schulz (Proc. Inst. Civil Engineers, Vol. 78, page 67, and Transac. N. of Eng. Institute of Engineers, Vol. 34, page 5):

Total cost of underground haulage by locomotive:

	Per ton in pence.
Steam engine.....	1.0
Electric engine.....	1.64
Compressed air engine.....	2.06

Total cost of various systems of underground haulage:

	Per ton in pence.
Endless chain.....	0.98
Rope-and-counter-rope.....	1.29
Electric locomotives.....	1.54
Rope-and-tail-rope.....	1.89
Endless rope.....	2.83

A comparison between electric transmission and mechanical methods was published in Berlin in 1883 by A. Beringer and awarded a prize by the electro-technical society there.

A resume of it appears in the *Revue Universelle des Mines* (ser 2 tome 15 p. 522). The following brief extract may be of interest:

Comparison of cost on 10 effective horse-power hours transmitted 1093 yards: By cables, 1.77d. per effective horse-power per hour; by electricity, 2.21d.; by hydraulics, 2.90d.; by compressed air, 2.93d.

Comparison of cost on 50 effective horse-power hours transmitted same distance: By cables, 1.35d. per effective horse-power per hour; by hydraulics, 1.87d.; by electricity, 2.07d.; by compressed air, 2.27d.

Comparison of cost on 10 effective horse-

power hours transmitted 5465 yards. By electricity, 2.64d. per effective horse-power per hour; by compressed air, 4.66d.; by cables, 4.69d.; hydraulics, 5.29d.

Comparison of cost on 50 effective horse-power hours transmitted 5465 yards: By electricity, 2.37d. per effective horse-power per hour; by cables, 2.65d.; by compressed air, 2.99d.; by hydraulics, 3.02d.

Steam was the prima motor used in each instance.

From the above figures it is inferred that for distances of about 1000 yards cable transmission costs least, but that in longer distances electricity takes the lead and maintains it against all other systems. The cost per effective horse-power per hour of the electrical pumping plant herein described is found by the figures as to cost already given to be 1.18 pence. It is obvious a future is before electricity in the transmission of power. For coal-cutting it affords a ready means of distributing power; for hauling engines, which can either be stationary or run to various parts of the colliery on prepared tracks, as well as in pumping, this new motive-power must take a place, and that no despicable one, in the future of colliery working.

## The River-Mining Dredge.

The scow Dayton was recently lanchoned on the Carson river, Nevada, and is to be used for taking the tailings from the bottom of the river, so as to recover the amalgam and quicksilver contained in them. The *Lyon County Times* has the following description of the apparatus:

The boat is 80 feet long and 30 feet wide, and when loaded with sluices and machinery will draw from 10 to 12 inches of water, and was built under the immediate supervision of Mr. Don Chisholm, ship-builder of San Francisco. The estimated weight of machinery to be used is 66 tons.

There is hardly any way to estimate the amount of wealth that is contained in the river for the reason that considerable gold has gone in, in years gone by, from floods down the different canyons. About the only way to get at any figures would be to find the number of tons of rock and tailings that have been worked for the past 30 years in the different mills on the river. At least from 20 to 30 per cent of the value of this ore and tailings is there, and to this can be added from three to four pounds of quicksilver to the ton. It is safe to say, however, that at least \$350,000,000 in quicksilver and amalgam has been lost in the last 30 years.

The machinery on one dredge will raise from 400 to 500 tons of the dirt in the river-bed every ten hours. This material will pass through grizzlies and over sluices. The grizzlies will separate the coarser material from the fine, the fine passing over the sluices catching and concentrating the amalgam, quicksilver and sulphurets. From the sluices the residue will be taken up into the agitators and treated with the Rao electrical process in order to catch any material that may escape from the sluices. The lowest assay from any material in the river is \$2.50 per ton, and will run from this up to \$6 and \$7 per ton. Upon the dredge about 15 men will be employed, of whom two-thirds will be unskilled laborers; the balance will be thoroughly skilled engineers and amalgamators. The expenses for their labor, and fuel, wear and tear of machinery, etc., will be from \$60 to \$80 per day. It is calculated that from 30 to 50 per cent of what is raised will be saved; this percentage does not include the quicksilver.

As to coal in San Francisco, a local circular says: "The situation, instead of improving, is in a still more deplorable condition, as the small stock on hand, combined with light arrivals, causes a still further advance—in fact, it will lead assuredly to some of our factories closing down pro tem; even if sufficient to meet the market, the coal is unobtainable in such quantities as required. The worst feature of the situation is the assurance of its unchanged continuance for the next three or four months at least, and even then it is questionable if any marked relief can be depended upon during the rest of the year. Our northern mines, instead of verifying promises made six months ago, that their output would be materially increased this year, have seriously diminished their shipments. It is true the principal collieries have had casualties—fires, strikes, etc.—that could not be foreseen, and these are to-day the principal causes for our present coal famine. It is difficult to give reliable quotations, as cargoes near at hand and on route of foreign grades are changing hands daily, each sale showing a profit on the former transaction."

CONSTANT improvements are being made at the local glassworks. There is now made at that factory nearly every kind of glass article of the common sort known to the trade. The works run heavily upon demijohns, carboys, wine bottles, mineral water bottles, and fruit jars. Last season's demand for fruit jars was very heavy, and this year more glass will be worked up into jars than ever before.

THE Pescadero Lumber Co. has been incorporated. The purpose of this corporation is to carry on a general lumbering business. The directors for the first year are A. C. Bassett of Menlo Park, S. T. Gage of Oakland, T. E. Stillman of New York, and N. T. Smith, T. B. Bishop and J. S. Severance of San Francisco. The capital stock is \$720,000.

## Passing Events.

The explosion of the boilers of the steamer Julia at Vallejo is the first disaster of the kind we have had on the bay for many years. Most of the unfortunate victims were laboring men going to their work at the Port Costa warehouses or the Selby Lead Works. Examination of the exploded boilers shows them to have been in apparently good condition, and the cause of the explosion is unexplained.

A very rich strike in the Delhi mine, Nevada county, has been made. One piece taken out is worth about \$5000. The rich streak now being worked is 8 or 10 inches wide, right on the center of the ledge.

Some good strikes have also been made in the new camps at Salmon river, Washington Territory. It is expected that many miners will prospect in that region this summer.

At Victoria, B. C., a bill has been passed giving foreign mining companies power to incorporate under the laws of the country or State in which the members of the company reside and work minerals in British Columbia by registering there. These concessions are for the purpose of attracting foreign capital for developing mining properties.

**BOILER EXPLOSION.**—By the explosion of the boilers of the steamer Julia at Vallejo on Monday last, between 25 and 30 lives were lost, and a number of persons badly injured. It was at first thought the oil fuel had exploded, but this has been found not to be the case. The investigation as to the cause of the boilers bursting is now being made, but has not been concluded at this writing.

## Product and Uses of Silver.

From the virulence with which the use of silver as a money has been opposed by the monometalists, it would be thought that the world had been or was about to be deluged with that metal. How little reason there is or ever has been for apprehending such result, a slight examination of the facts makes readily apparent. This uneasiness, real or affected, about a dangerous increment of silver, was due to the large output of that metal which followed the discovery of the bonanza deposits on the Comstock lode, an event that occurred now some 14 or 15 years ago. Comparing the last with the first half of that period, it shows a decrease instead of an increase in the product of silver; that is to say, the seven years extending from 1831 to 1837, inclusive, yielded less silver by several million dollars than the seven years extending from 1874 to 1880, inclusive. We speak here of the Pacific Coast, which turns out more than 65 per cent of the world's product of silver. If there has occurred meantime any increment elsewhere, it has been small—not enough to make good the above deficiency.

We have then this set of facts staring us in the face: While the demand for silver has, through the rapid growth of population and business, been steadily on the increase, the quantity of that metal produced has actually been diminished. The superabundance of the white metal predicted, and perhaps feared, has not taken place. In the countries where it is most largely in use, it circulates as freely as ever. Everywhere it continues in favor with the masses; nobody distrusts nor does anybody refuse it.

If any one declines to accept it in payment of large sums, it is simply because it is bulky, and not because they fear that it will through overproduction depreciate in value. If the price of silver has of late years suffered decline and still remains low, this has been due solely to the efforts made by those interested to effect such depreciation, and which efforts, being short-sighted and selfish, opposed to the necessities of the times and the traditions of history, must ultimately fail of their purpose.

Despite the endeavors made to ostracize and dishonor it, silver is destined to keep its place as one of the moneys of mankind, performing its functions to that end co-ordinate with gold. This is inevitable. With great wars averted, as they seem likely to be, the human race devoting their energies to peaceable pursuits, there will ensue an era of unwonted industrial activity and material development. Enterprise will be stimulated and populations be multiplied at a rate heretofore unexampled. With such expansion and growth, very readily will the present output of silver, less than a hundred millions per annum, pass into the great currents of trade. Very readily will such pitiful sum find absorption among the silver-taking and silver-hoarding peoples of India and the Orient. The question of the future is apt to be where are we going to find a supply of silver adequate to the requirements of art, manufactures and commerce, rather than what shall he done with the superabundance of that metal. That the world's production will undergo some increment is probable, but that it will keep pace with the progress made in other respects can hardly be expected.

California is not largely a silver-producing country, her bullion consisting mostly of gold. Of silver she now makes less than \$3,000,000 per annum, her product having, contrary to expectation, fallen off somewhat during the past two years. But, while it might advance the interests of this State to appreciate gold at the expense of silver, there has never been shown a disposition on the part of either the people or the press of California to pursue such narrow and selfish policy. We would rather, at some cost to ourselves, see a policy come to prevail that without injuring any would bring large and lasting benefits to other sections of our common country.

The State Mining Bureau has received several mummies, which were found in Mexico, near the borders of Arizona.

The Eureka Con. furnaces and refinery have closed down for a cleanup, the first in ten months.

The Tilly mine, in the Fresno foothills, after being idle for two years, has been started up.

## Hints to Prospectors.

## The Silver Plant.

In recent numbers of the PRESS we have given extracts from Prof. R. W. Raymond's paper on "Indicative Plants," or plants which indicate the presence of certain minerals in the ground. Mr. Aug. Raht of Wickes, Montana, sent to Prof. Raymond a specimen of a plant which he said was generally regarded by experienced prospectors as an indication of silver ore in the soil on which it grows. Prof. Thos. H. Porter of Lafayette college determined and described the plant, and expressed to Prof. Raymond the opinion that the supposed relation between the plant and the metallic constituents of the soil was not improbable and was certainly worthy of investigation.

Of this plant, *Eriogonum ovalifolium*, which may, perhaps, be destined to wear the title of the silver plant, a drawing in natural size is

THE SILVER PLANT—*Eriogonum ovalifolium*.

shown on this page. It shows but one peduncle or flower-stem perfect, and two broken in transmission. But as Mr. Raht states, the specimen, when complete, was but a small part of the bunch or clump from which it was taken. One of these bunches contains sometimes as many as 25 flowers.

The genus *Eriogonum*, of the order *Polygonaceae*, is distinctly marked, and almost exclusively North American. It embraces over 100 species, two of which occur in Mexico and 97 in the United States. Of the latter, two are restricted to the South Atlantic States, and the remainder cover the region between the Mississippi and the Pacific ocean. The genus has been divided by Watson (*Proc. Am. Acad.*, vol. xii.) into three sections, and the plant now under consideration belongs to the third (*Oregonium*), being included in a sub-genus, *Heterosepala*.

It is variable and abundant in the mountains and on the foothills of the Sierra Nevada to the Rocky mountains and northward to the British boundary. The form figured is the dwarf mountain form common in the mountains of Montana and Idaho and remarkable for its small leaves, coated with a thick white fur, and its head of rose-colored flowers. It grows in low dense tufts or turf-like bunches, its bluntly pointed leaves narrowing into slender foot-stalks and its flower clusters supported by long, smooth, slender stems. Some specimens, apparently of the same variety, had yellow

flowers. Prof. Raymond says: "It will be interesting to ascertain by further inquiry whether this difference in color (which is quite within the limits of variation shown by the species) is considered significant by prospectors. Moreover, I trust the members of the Institute will use their opportunities to determine how widely the belief of the *Eriogonum* as a 'silver plant' is entertained, and what foundation there is for it. The discovery of the plant growing wild in localities where there are no silver ores would tend, of course, to disprove the belief, but its absence from argentiferous localities may prove nothing."

It is quite reasonable to believe that the presence of a minute proportion of some metallic ingredient in the soil may affect the color of a plant absorbing it. On the other hand, it is not certain, even if a plant is proved to indicate by color or other peculiarities the presence of silver, that silver is the substance actually entering into and altering the plant. The effect may be due to some other mineral substance associated with the silver ores; and our silver plant may be indicative of silver in a silver region only. A similar case is presented in prospecting for gold. As we all know, most of the signs (apart from visible particles of gold) which indicate to us a favorable "quartz," are due to the decomposition of iron pyrites or other minerals, with which the gold has been associated; and these signs have often been observed (and followed to disappointment) in localities where there was no gold at all.

Now the *Eriogonum ovalifolium* appears to have a geographical range in this country almost as great as that of the *Artemisia* or wild sage; and if that is all we can find out concerning it, it would be but a vague guide to silver mines. Everybody knows enough to look in foothills and mountains in the sage country for indications of silver ores. But if this widespread *Eriogonum* shows in the presence of silver some peculiarity, minute, perhaps, but constant, then it will vindicate its title as the silver plant. An analysis of this plant was made. In the rose-colored plants arsenic was found, but there was none detected in the plants with yellow flowers. Silver could not be found.

## Ore Reduction.

The tendency is at present to establish large reduction works at central points to which ores may be brought for beneficiation. The great reduction works at Swansea attracted ores from all over the world, and it became a great metallurgical center. By having a great variety of ores to work upon, they are so combined and treated that all the products of any value at all are extracted. By this means they are enabled to ship ores long distances and work them to better advantage than could be done where they were originally mined.

In the United States the advantages of this system are beginning to be appreciated, and a number of reduction centers have been established. Salt Lake, Omaha, Newark, Denver, Pueblo, Socorro, Kansas City, Wickes, San Francisco, and other places, obtain large quantities of ores mined at other places.

Portland, Oregon, is endeavoring to make itself a smelting center, and a number of other places are engaged in the same direction. Of course there must be good railroad or water communication with all such points. And in this connection it is becoming apparent that the railroad companies are exercising a very decided influence on the direction which the ore will take. By raising or lowering freight rates one way or the other they are enabled to turn the flow of ore to the center they favor. It is evident, however, that in order to encourage this shipment of ores some of the roads must materially lower their rates. It would seem good policy for the roads to put the freight on ore at the lowest possible point. They thus make traffic for themselves and assist materially in developing the regions through which they run.

The total yield of gold in the Cariboo district, B. C., during 1887, was \$603,258. The average rate of earnings per hand employed was \$296.

The copper mines about Luning, Nev., are creating a stir in mining circles.

CONSIDERABLE ore is being shipped to Selby's from Lodi and Downeyville, Nev.

## The Late General Master Mechanic of the S. P. R. R.

### His Many Inventions and Mechanical Designs.

In the death of Andrew J. Stevens, for many years general master mechanic of the Southern Pacific R. R., California has lost one of her most noted mechanics and inventors.

As a natural result of being so prominently identified with mechanical pursuits and having to originate or design new forms or appliances, Mr. Stevens became an inventor. He invented a number of things now in use on steamships, locomotives and in the shops, several of them of very great importance. For years past he has done his patent soliciting business with Dewey & Co.'s MINING AND SCIENTIFIC PRESS Patent Agency in San Francisco. The records of the patent office alone would scarcely show how much of a worker in inventions Mr. Stevens was, since the firm alluded to have made annually for him numbers of examinations to determine the novelty or patentability of appliances he has devised. Of course only those which proved to be original with him were patented, for he naturally, like other inventors, met many instances where he had been forestalled by others. In cases where he found that his design or device was practically covered by patent already, he pursued the idea no further, not caring for any patent which gave him only slight details or modifications of no special moment. Several of his inventions were, however, radical in their effects.

The last patent obtained by Mr. Stevens was for a balanced slide valve, No. 357,424, Feb. 8, 1887. This consisted of a valve sliding upon a valve seat and having in addition to the usual steam exhaust cavity or cavities, an auxiliary passage through it for steam supply and exhaust purposes, according to the position of the valve. In connection with this valve is a shield or balance plate and an oval balance ring fitting between the upper side of the valve and the balance plate. This valve serves the purpose of both admitting steam to the cylinder and exhausting it from the cylinder. The oval ring is very different from the circular balanced rings or packing strips, forming a square on the back of the valve. The difference is that with the circular packing it is impossible to cover the back of a valve that is twice as long as it is wide. It would take two rings to cover the back of such a valve; consequently, the expense of working and maintaining would be increased. With a square strip, there are four joints on four separate packing rings; with the oval ring, the back of any valve is covered to any desired extent with one ring, no matter what length or width. It is simple, cheap and durable. There is only one ring, one joint, and the purpose is effected with a packing-ring in one piece. While all valves balanced in the way this one is are considered to be upon the same principle, the mechanical construction of this one is radically different from anything that has been made, and takes the place of two rings where circular rings are used, and takes the place of four packing strips where they are used.

On Sept. 7, 1886, Mr. Stevens took out patent No. 348,700, on an apparatus for burning petroleum. This is the device now in use on the ferry steamers of the Southern Pacific Company. This apparatus is specially designed for burning hydro-carbons in steam-boiler furnaces. The peculiar features are in the construction of the atomizers and the arrangement for the supply of air. The exterior oil-conveying pipe is fixed on the rear end of the nozzle, which serves to close it, and combined with this is an interior steam or air-conveying pipe having an annular series of holes or openings made through it just behind and in close proximity to the nozzle, this nozzle having an enlarged chamber at the rear and a narrow slit or discharge opening at the front. Within the space which is ordinarily devoted to doors for

the introduction of coal or other fuel into a furnace, is fixed a tubular metal frame through which air is allowed to enter the lower part of the furnace and come in contact with the lower portion of the broad sheet of inflamed oil which has been injected into the furnace by the peculiar atomizers. A damper regulates the flow of air through the inlet passage. This inlet supplies a strong current of air, the oxygen of which, striking the inflamed body of oil which is injected into the furnace, produces a strong combustion as it is discharged into the partially inclosed portion of the furnace formed by the arch and bridge-wall, so that the action therein is similar to that of a retort, maintaining the body of inflamed gas and carbon at a white heat. The products of combustion passing over the top of the arch and thence into the tubes or flues through the boiler, or beneath the boiler behind the bridge-wall, according to the particular construction used.

By this construction it was possible to introduce a large body of air, and by discharging it into the furnace on a plane nearly parallel with that of the incoming sheet of inflammable gas or oil, it unites therewith, so as to produce a very perfect combustion; and the temperature of the air is raised so highly before it passes over the arch and into contact with the crown-sheet of the furnace or the tubes of the boiler that there is no danger of ill effect on account of the admission of cold air. The steam and oil are conveyed through respective pipes which lead horizontally along the front of the furnaces, having stop-valves and oil and steam regulating valves. The fine spray or vapor produced and discharged through the narrow horizontal slit of the nozzle is really atomized by Mr. Stevens' appliances by three successive and continuous operations, so that a very perfect combustion is assured.

December 6, 1885, Patent No. 331,917, for a feedwater purifier for steam boilers, was issued to Mr. Stevens. This consists of an inner shell into which water is admitted, and within which it is heated so as to rise to the top, where it passes through perforations into an exterior inclosing shell, between which and the inner one it descends, passing through holes in the bottom of the annular space into the boiler. A perforated blow-off tube extends along the bottom of the inner chamber, and through this the deposited sediment may be discharged from time to time by means of an outside cock. The impurities contained or suspended in the water are precipitated to the bottom of the chamber, from which they may be blown out.

The deflector-plate for fire-boxes was patented by Mr. Stevens November 3, 1885 (No. 329,603). The invention is an improvement in guard-plates or deflectors that are applied within steam-boiler fire-boxes behind the draft-openings, but to bring the air into more complete contact with the surface of the fuel, and to produce such intimate combination of air or gases and consequent elevation of temperature that the tubes are not exposed to direct contact of cold air from the draft openings. The deflector is fastened to a rod or shaft on the front of the furnace door so as to be moved up and down upon this point of attachment as a center. The deflector is a concave plate shaped like a scoop, and of such width as to fit in the opening in the furnace door. The deflector is so hung or balanced that it is turned down or depressed by its own weight as the door is opened and thrown back. The deflector being therefore permanently attached to the door, is automatically adjusted and brought into the required position for service inside the furnace, and is also withdrawn from the opening and turned down closely against the door out of the way of the fireman by the act of swinging back the door. As thus applied, the deflector is a fixture, and is moved into and out of action automatically by the movements of the furnace-door on its hinges.

Patent No. 305,248, September 16, 1884, relates to a novel construction of a power-lifting crane, wherein steam is employed as the lifting agent. It embraces certain constructions and combinations of lifting cylinders and connected parts for raising the load and a locking mechanism of novel character for holding the load at any point and relieving the lifting mechanism of the suspended weight. While the idea is adapted to hoisting cranes generally, the special adaptation designed by Mr. Stevens was for a powerful light and easily-operated crane, for use on railroads, to coal locomotives, load cars and other work. Its main application has been in this direction, and a number of the ma-

chines are in use on the railroads in this State. The design was one of Mr. Stevens' greatest successes. The crane is portable, and, standing on a car, can be run and used anywhere.

The valve-gear for steam engines invented by Mr. Stevens, and which is now so largely used on the locomotives of the Southern Pacific, was patented by him Nov. 6, 1883, the number of the patent being 288,133. Briefly, it consists in imparting to the valves an independent variable movement in connection or in combination with their general movements, whereby a differential instead of a regular movement and action of the valves upon their parts is obtained, the effect of which is to enable one valve to cut off at any required point and the other valve to retard the exhaust until the stroke is completed. The gist of this important invention may be stated as follows: The improvement in operating slide valves of engines, consisting in employing a separate valve-rod for each valve; in connecting each rod to a rotary disk having a movement of rotation upon its center imparted to it directly or indirectly from the engine piston, and then making connection of this disk by its center or axis with the general valve-gear or valve-actuating mechanism, whereby said valves receive independent movements from the rotation of the said disk, which movements qualify and counteract the general movements received from the valve-gear. This was Mr. Stevens' greatest invention, and, in connection with his balanced valves elsewhere referred to, makes the locomotives far superior to those with the old-fashioned link-valve gear. A marked economy in fuel results from the use of this invention.

On April 5, 1881, Patent No. 239,877 was issued to Mr. Stevens for a friction brake for steering apparatus for vessels. This is one of that class of brakes for holding the wheel or drum or steering apparatus for vessels, in which the axle or chain drum or steering gear has a band-wheel or sheave provided with a strap passing around it, the two ends being connected to a tightening mechanism. The invention was to render the tightening mechanism more effectual and practical in its operation, and also combining and arranging the brake and its operating valves or other controlling mechanism of power steering apparatus for vessels in such a manner that the brake is operated automatically by the same lever or device which stops and starts the power, and the other is thrown off as the other is brought into action, or vice versa.

His feedwater heater was patented April 12, 1871, No. 240,197. This consists in a novel device for introducing and supplying feedwater to boilers, in such a way as to keep the feedwater from contact with any part of the shell or tubes of the boiler, as it is supplied by the pumps by which incrustation is prevented, and also irregular and improper expansion and contraction of the shell and tubes. Mr. Stevens applies and combines with the boiler and within the space inclosed by the shell, but detached and separate therefrom, a reservoir into which he introduces and supplies the feedwater, and from this reservoir the water is caused to flow into the boiler and mingle with the body of water therein, as required, after its temperature is raised. This reservoir is supplied from the feed-pumps in the usual manner, and there is also provided a means for readily removing and cleaning out any sediment deposited.

Patent No. 230,079, issued July 13, 1880, was for an improved means for operating the tiller of a vessel from the reciprocations of a piston-rod of short stroke. It consists in giving to a differential drum or band a movement of rotation as well as a motion or travel in a right line from the movements of a piston in its cylinder, by which the ropes or chains from the tiller of vessel, being attached to the drum, are wound or unwound as the piston is moved and the tiller is thereby caused to travel in the required direction with an increased movement over the length of stroke of the piston. The object of this invention is to admit of a short-motor-cylinder and to produce the required sweep or movements of the tiller from a short stroke of piston without complex multiplying mechanism. The result is a steam-steering apparatus compact in form and simple and effective in operation.

The general power-steering apparatus for vessels was patented by Mr. Stevens August 24, 1880, the patent being numbered 231,505. The apparatus is for moving, holding and locking in position the rudder of a vessel during the operation of steering. It consists in an improved arrangement of a steam cylinder and multiplying mechanism for obtaining the required extent of motion of the rudder from a piston of short movement, in combination with the piston-rod or other connection through which the motor-cylinder operates upon the tiller, of one or more checking and holding cylinders having pistons which are locked or held at rest by the

action of a body of liquid confined within the cylinders. This apparatus possesses every requirement of a steering power, and is used on the large ferry steamers of this bay. It also allows the vessel to be handled with the ordinary steering apparatus when the power-cylinder cannot be supplied with steam, or when it may be injured or any one of its parts broken.

The flue and tubular boiler invented by Mr. Stevens was patented August 8, 1876, No. 180,956. It is one of the return tubular class, and consists in the employment of two chambers, situated one above the other, and at some point between the ends of the boiler, so that four flue-sheets are provided for securing the flues and tubes, which are thus made correspondingly shorter, while the elasticity of these sheets allows for the difference of expansion and contraction between the tubes and shell of the boiler much better than when the flues extend the full length, and thus reduces the danger of breaking the flues off at the point where they are secured to the sheets. The chambers give more room and time for the combustion of gases and a larger amount of heating surface, while, by connecting the upper and lower chambers by short tubes, flame is allowed to pass from the lower to the upper one so as to ignite and keep up the combustion of the gases which have passed through the back-connection and returned to this point. A greater amount of heating surface is obtained than would be the case if the chambers were dispensed with. A further advantage is found in the fact that the flues and tubes may be made in four sets, less than half the usual length, and with a correspondingly less contraction and expansion by cooling and heating. The walls of the chambers receiving the ends of the tubes in the same manner as the flue sheets, provide an elastic support at each end of each set of flues, which easily compensates for the differences of expansion and contraction which take place between the tubes and the sheet of the boiler. The inventor was thus enabled to prevent entirely the breaking of the tubes at the neck or point where they are secured to the sheet—a common difficulty where flues extend the whole length of the boiler.

In the same year, on August 22, Mr. Stevens secured Patent No. 181,370, for steam-moved valves. This was an improvement in direct-acting engines of that class in which the valves are moved by steam and independently of any exterior mechanism. The improvements consist in a novel construction and operation of valves for admitting steam to drive the main valve, which is also peculiarly constructed in detail. It would be difficult to convey a very good idea of the details of this invention without the aid of engravings.

The vacuum relief-valve for steam cylinders, invented by Mr. Stevens, was patented January 20, 1874, No. 146,617. The object of this invention is to relieve the vacuum which is produced in the cylinders of locomotive engines when the engine is running upon a down grade with the throttle-valve closed. The improvement consists in attaching a valve to the steam pipe inside the dome of the boiler, which will remain closed as long as a steam pressure is kept up in the steam pipe, but which will open when a suction or back pressure is created inside the steam pipe by the pumping action of the piston when a locomotive is running without steam so as to admit a quantity of steam at each stroke of the piston, and thus relieve the vacuum and lubricate the piston. A stem serves as an indicator to tell when the relief-valve is working properly, and also serves as a means of enabling the engineer to control the action of the valve, as he can readily open or close the ports at will by means of this stem.

Patent No. 154,529, issued August 25, 1874, covered, in a slide valve, bars and balance yoke in combination with a valve and seat. The balance yoke or follower works steam-tight against a smooth surface or seat on the inner side of the steam-chest cover, thereby protecting the back of the main valve from pressure, thus allowing the same to be worked with great ease. The bars are let into the steam-chest at either end and carry the balance yoke, holding it in between yokes steam-tight contact with its seat when it is not held by steam pressure.

The locomotive furnace was patented Dec. 23, 1873 (No. 145,819). The claim allowed by the Patent Department on this invention is "a boiler-door provided with a damper on the outside and an air-deflector on the inside, so that when the former is opened the latter deflects the whole current of air and directs it into the fuel."

Another locomotive boiler furnace was also patented Feb. 14, 1871 (No. 111,884). This covered flues with dampers in combination with deflecting plates. In combination with these it also covered a steam-jet pipe.

Patent No. 100,814, dated March 15, 1870, and ante-dated March 5th, was for a steam-

(Concluded on page 144.)

## MECHANICAL PROGRESS.

## For Every-Day Use in the Engine-Room.

The average weight of anthracite coal is 93.5 pounds per cubic foot.  
Coke (loose) weighs 23 to 32 pounds per cubic foot.

Bituminous coal weighs, per heaped bushel, loose, 75 pounds; one ton occupies 48 cubic feet.

Cast iron weighs per cubic inch, .7604 pounds; in round numbers, one-fourth of a pound to the cubic inch.

Cast iron will expand and contract between the extreme ranges of temperature in this country with a force equal to  $4\frac{1}{2}$  tons per square inch of surface exposed.

Wrought iron expands and contracts between extreme ranges of temperature equal to nine-tenths of one per square inch of section.

One gallon, U. S. standard, contains 231 cubic inches; weight of water in same, 8.331; one cubic foot contains 7.4805 gallons of water.

The velocity of steam, of atmospheric pressure, flowing into a vacuum is 1660 feet per second; into air, 650 feet per second.

To find the pressure in square inches of a column of water, multiply the height of the column in feet by 434.

The proper safe-working load for wire rope is as follows: One-half inch in diameter, 1000 pounds; five-eighths inch, 1500 pounds; three-fourths inch, 3500 pounds; one inch, 6000 pounds. This is for 19 wires to the strand, hemp centers.

To find the diameter when the circumference is known, multiply the circumference by .3183.

To find the area of a triangle, multiply the base by one-half of the height.

No. 1 wire-gage sheet iron weighs 12 $\frac{1}{2}$  pounds per square foot; No. 2 iron, 12 pounds; No. 3 iron, 11 pounds; No. 4 iron, 10 pounds; No. 5 iron, 9 pounds; No. 6 iron, 8 $\frac{1}{2}$  pounds; No. 7 iron, 7 $\frac{1}{2}$  pounds; No. 8 iron, 7 pounds.

To find the lap required on a slide valve to cut off steam at three-fourths stroke, multiply the stroke of the valve in inches by .250; the product is the lap in terms of the stroke. To cut off at two-thirds stroke, multiply by .289, lead not considered.—*Journal of Progress*.

**A NEW DEPARTURE IN BRAZING AND WELDING.**—Under this head a correspondent of *London Iron* writes to that journal as follows: The cheapening of oxygen by Brin's process of manufacture has put into the hands of metal-workers a new power. I have recently made a few experiments with the compressed oxygen and coal gas, and found that with a  $\frac{1}{2}$ -inch gas supply a joint could be brazed in a 2-inch wrought-iron pipe in about one minute, the heat being very short, the redness not extending over one inch on each side of the joint. The appearance of the surface after brazing led me to experiment further with welding, a process which is not possible with ordinary coal gas and air, owing to the formation of usnetic oxide on the surfaces. Contrary to my expectation, a good weld was obtained on an iron wire  $\frac{1}{2}$  inch in diameter, with a very small blowpipe, having an air jet about 1.32 inch in diameter. This matter requires to be taken up and tried on a larger scale for shop work as welding boiler plates, which, it appears to me, can be done perfectly with far less trouble than would be required to braze an ordinary joint. The great advantage of this would be that the boilers would require no handling, but could be welded with an ordinary large blowpipe in position, and with about one-tenth the labor at present necessary. The cost of the oxygen is trifling, and it is evident from the results obtained in brazing that the consumption of gas would be considerably less than one-fourth that necessary with an air-blast, irrespective of the fact that welding is possible with an oxygen blast, whereas it is not possible if air is used. The surface of iron heated to welding heat by this means comes out singularly clean and free from scale, and a small bottle of compressed oxygen with a blowpipe and a moderate gas supply would make the repairs of machinery, boilers, brewing coppers, and other newly apparatus a very simple matter. The trouble and difficulty of making good boiler crowns which so frequently come down would be very small indeed when the workman has an unlimited source of heat at command, under perfect and instant control.
